TENSION in band saws signifies the expansion of the metal throughout the central portions of the blade, so as to stretch the outside edges and particularly the back edge. A saw when strained on the wheels must be the tightest on the cutting edge, so as not to let the saw run in or out of the cut. The speed of band saws has very little to do with the tension, although it has much to do with the work and life of the saw. Either too much or not enough speed will have similar influence in inducing cracks. Some band saw filers believe a band saw must not be open closer than 1 or 1½ inches from the edge. They claim that a saw will crack if it is opened any closer than an inch from the edge. Yet saws opened from edge to edge do not always show cracks. But if a saw is open from edge to edge the tension must be put in evenly. If a saw is wide open and the tension not even, the saw will chatter in the cut and is most likely to come off the wheels, cracked. Practical band saw men say that a band saw will not do good work without tension. The back of a saw must be looked after as well as the tension. The back of a saw should be crowned so as not to allow the cutting edge to dodge and make snaky lumber. A saw crowned about ⅜ inch in every 5 feet gives good results where the wheels are in good shape and in perfect line.

AT the Dexter plant, Tuscarora, Nev., where slimy ores are treated, the method, as described by William Magenau in this paper some time ago, is quite different from that at the Chainman. The ore is crushed with stamps and amalgamated as usual, the tallings then go to the settling tanks, equipped with Butters & Mein distributors. The settlers catch 51% of the material run into them, the overflow carrying the slimes being run into ponds and settled. As soon as one pond is full the stream is turned into another, and the former is allowed to dry for several months. The climate is so dry that in this time the upper 2 or 3 feet of the material become well baked. It is then put into cars by means of wheeled scrapers and carried to the leaching tanks to be mixed with the sands. As soon as a settler is full of sands, they are shoveled into cars and carried to the leaching tanks, where they are mixed with the dried slimes in the proportion of one car of sands to one of slimes. The mixture is leached continuously for from three to five days with a 0.2% solution of cyanide, the solution running in at the top as fast as it runs out at the bottom. Before discharging, a single water wash is given after the charge has been allowed to drain for several hours, or until no more solution runs off. The cyanide solutions go directly to the zinc boxes. The sands average \$1.57 gold and \$1.70 silver and the slimes \$3.19 gold and \$5.03 silver; the extraction is 68.8% of the gold and 37.7% of the silver.

THE electro-magnetic gold extraction process recently patented by Elmer Gates of Washington, D. C., is a "hydro-magnetic separator," by means of which the inventor proposes to separate gold from magnetic iron or magnetite. It may be but one more of those "magnetic separators" so numerous and so successful in theory—and so much of a joke to the practical miner. The object of Prof. Gates' device is to remove from the gold-bearing sand the magnetic iron which it always contains, as a preliminary to separating the gold as in the ordinary way, either by washing or by amalgamation. The apparatus consists of a copper drum, inside of which is an electro-magnet. The core of the magnet is made up of a number of iron plates with fluted edges on the pole face of one end, likewise within the drum, but which approach their fluted edges close to the inside of the copper periphery of the latter. Above is a hopper through which the sand is poured. As the gold, silica and magnetite pass through the hopper they necessarily touch the side of the drum, which is kept revolving by means of an electric motor. The drum, owing to the magnet inside of it, draws the particles of magnetic iron out of the sand which naturally adhere to its surface while the sand drops into a receptacle below the machine. The particles of iron, while magnetically held against the drum, are moved downward by it over the way lines of force of the fluted magnet face and vigorously shaken so as to detach all foreign matter. The inventor says that in practical mining work the gold would be left in with the siliceous sand, which would subsequently be put through one of the ordinary processes, with a view of separating it from the precious metal, and he argues that the magnetite once removed, the separation of the gold from the sand would become comparatively easy, claiming that from two to five times as much of the gold is derived from a given quantity of the raw material. He states that his method is simplicity itself, and further that it costs but 3 cents for each ton of sand treated. He also claims that the iron removed from the sand in the manner just described is an exceedingly valuable by-product. At an expense of 85 cents per ton he proposes to reduce it by means of the electric current into lumps, in which form it would be sent to any smelting works.

The Mechanical Engineer a Factor in Modern Mining, Milling and Smelting.*

In the early history of mining and smelting the mechanical engineer was not considered to be of very great importance. Nearly every man managing a mine had some mechanical ideas, often too many for the comfort of the man who had made mechanics his special study. It may be due to this fact that the position has not had the proper recognition and its importance fully recognized by the men who have had to do with the managing of mines and smelters.

To-day, all the professions engaged in the reduction of ore are parts of a system, and its successful operation is due to the perfection of its component parts. The geologist who studies the nature and character of the mineral vein, and its bearing on the methods to be pursued in mining, the metallurgist who defines the method of recovering the values in the ores, the chemist who determines the value and contents of the ore, and to whom we owe the development of explosives used in modern mining, the mining engineer who directs the work of the miner, tells him when and where to go, measures his work, determines the extent of the ore bodies—all, in their several spheres, are important and necessary in the building up of a great mining industry. But it is of the part the mechanical engineer has taken in the development of modern mining and smelting of which we wish to speak. The subject is comprehensive and only a brief outline of the work accomplished in Butte can be given in a short address.

There has been but little progress made in the metallurgy of copper in the past twenty years. The methods of reducing the ores are the same now as then—it has simply been an increase in the efficiency of the appliances used, the better mechanical construction of the furnaces, the improvements in transportation, the application of electricity and compressed air to the handling of materials, and the development and improvements in machinery of all descriptions used in the mining and reduction of copper ores. The handling of a large reduction works has about resolved itself into a mechanical proposition, and its successful operation depends on the precision and reliability of the mechanical appliances in use.

Starting with the mining of the ore we will speak of the appliances used by the prospector; the tools required are few: a pick and shovel, a few drills of different sizes, a case of dynamite, some caps, and perhaps a pack horse or mule. If he has found a ledge he starts to develop it by driving a tunnel or sinking a shaft; driving a tunnel is easier, ordinarily, if the ledge is favorably located; but the probabilities are that he will have to sink a shaft. When the prospector arrives at that stage two men are needed to do the work and an application of some mechanical means for hoisting is necessary. The windlass is perhaps the simplest machine in use for hoisting ore in Butte to-day. Such a method can only be used by the prospector who is searching for or developing a lead, and the value of whose time is measured by the hope that he may make a valuable strike, and, buoyed by that hope he denies himself the associations and comforts of home and society, brave the winter's storm and summer's heat, and perhaps after a life of privation ends his days in a lonely cabin. This is not an uncommon experience. Often the beginning of a large mining camp is traced directly to the prospector working with his primitive appliances.

Following the hand drill came the application of compressed air and machine drilling; although of comparatively recent origin the machine drill as made to-day is a triumph of mechanical engineering skill, and has made possible the development of our large mining interests.

Following the use of a windlass came the machine known as a whim and animal power used to operate it. If an intelligent horse is used he becomes obedient to the mine signals the same as the men who are engaged in the work. The bucket holds perhaps from 800 to 1000 pounds of ore and the hoisting is very slow, not over 80 feet per minute.

The next step in mining is the introduction of steam power and its application to the hoisting of the ore. A small geared hoist, attached to what is termed a "gallows-frame," is used, the ore being loaded in a bucket, hoisted to the surface, and emptied into bins close to the shaft.

The next improvement is to use a cage in the shaft in place of a bucket, and to take a small car down the shaft to the required station and fill it where the mining of the ore takes place; first one cage was used in a single-compartment shaft; later a two-compartment shaft was constructed and two cages used in order that the ascending load should balance in part the descending load, the engine lifting, in ordinary running, only the weight of the ore and the

rope. Then in order to increase the output of ore from each shaft double-deck cages were used with single-acting engines, powerful enough to raise the load from the bottom of the shaft. At the West Colusa mine of the Boston & Montana Co., in place of double-deck cages, single cages are used in each compartment, each holding two cars. This necessitates a shaft, each compartment of which is 5 feet wide by 9 feet long.

The Anaconda Co., in order to cheapen the hoisting of ore, substituted large skips in place of the two, three and four-deck cages. Small ore bins were constructed underground at the different levels to receive the ore from the stopes. The skips are loaded from these small bins, the gates of which are operated by compressed air. Eight to ten tons of ore are loaded into the skip and hoisted to the surface by means of powerful single-acting steam engines. Ore bins are constructed at the top of the shafts and the ore dumped automatically from the skips into these bins.

With the increase in size of engines and loads stronger gallows-frames were required. Large wooden gallows-frames were made of Oregon timber, sometimes as large as 20x24 inches and 60 to 80 feet in length. Finally it was found necessary to build them of steel and they are now made from 100 to 120 feet high. The first steel gallows-frame erected in Butte was over the West Colusa shaft in 1897; afterwards steel gallows-frames were erected at the Anaconda mines, much higher and stronger in every way.

The pumping of the water from the mines of Butte is not the least of the difficulties with which the engineer has to contend. In the early days, when the mines were silver properties, the water did not contain acid and could be used in the boilers, but as the ore changed to sulphides the water became more acid. Iron pipes, iron water-ends of pumps, and, in fact, wherever the water came in contact with iron, it was rapidly destroyed. As the mines became deeper the difficulties increased—the water was warmer, and made still more so by the exhaust steam from the pumps it was required to condense. Simple station and sinking pumps were used to pump the water from station to station until it reached the surface. Improvements were made from year to year—wood and lead-lined pipes substituted for the all-iron, larger units were installed, until now the water is lifted successfully 1200 feet by compound Corliss engines with bronze pump ends.

The transportation of ore was first done by pack horses and mules. They carried sacks of ore away from the prospect holes to the point of shipment. Later came the construction of roads, after which wagons were used. Nowhere, perhaps, are such large and heavy wagons in use for transportation of ore as those made and used in Butte. Six and eight-horse teams pull as many tons in these wagons. Later on the railroad was built close to the shafts, where ore bins were constructed, to which the ore was trammed, or dumped by the skips, and finally loaded into cars carrying from fifteen to twenty tons. The mechanical construction of the ore cars has been so perfected, steel having been substituted for wood, that they carry to-day fifty tons each, reducing the cost of transportation to about 1 cent instead of 50 cents or \$1 per ton mile, as it was originally. Now it is common to see an engine pulling a train carrying 2500 to 3000 tons of ore.

There has not been much attention given to the transportation of ore underground as yet. All the ore originally mined and most of the ore to-day is trammed by men from the stopes to the shaft station, but in the last five years horses are being used in some of the mines. It is interesting and amusing to see them strap a horse and send him down a shaft that is only 4 feet by 4 feet 6 inches in the clear. In these mines there are stables underground and the horses are seldom brought to the surface. At the large shaft of the West Colusa the horses are lowered and raised every shift, and they know as well as the men when it is time to quit, and they are always waiting to step aboard the cage and come to the surface. The large companies are constantly at work on this problem of underground transportation and no doubt some satisfactory solution of the question will be arrived at, either by the application of compressed air or electricity.

The first step in the treatment of the ore is concentration. The first copper ore that was mined in Butte was that encountered in the bottom of the shafts of the properties that had been started as silver mines. Originally the only ore that could be shipped at a profit was that carrying very high values in copper and silver. The first concentrator was built in Butte by the Montana Copper Co., afterwards the Boston & Montana Co., during the winter of 1879-80. The ore was crushed by an 8x10 Blake crusher, then passed over a shaker to a pair of 10x20-inch rolls, then to revolving trommels having 1/2-inch mesh screens, the oversize into a set of 10x16-inch rolls. This was all dry crushing and no water was used until the material went to the jigs. The fine material that was made in mining and crushing the ore was sized by a trommel having 8-millimeter, 5-millimeter, 2 1/2-millimeter and 1 1/2-millimeter screens, each size followed by a four-compartment Hartz jig. Tailings were made from each jig from the 1/2-inch down to the smallest size. Owing to their coarseness

they carried considerable values. All concentrates were shoveled from the side of the jig onto the floor and loaded into the cars to be taken to the roasters. The coarse concentrates were treated separately. Dry crushing was very detrimental to the health of the men and bad for the machinery. This was the only plant designed for dry crushing.

The principal improvements in concentrating have been made by means of coarser crushing and concentration. This was only made possible, however, by the development of blast furnace smelting. In reverberatory smelting it is necessary to crush ore much finer in order to produce high-grade concentrates that can be roasted. The tendency has been at all times to make a concentration of the ore in as large sizes as will permit a gravity separation of ore of a required mineral percentage. The Butte & Boston Co. made jigs that would handle ore passing through screens having 2 1/2-inch openings. After the coarse concentrates are taken out the work of crushing and grinding the ore, or "middlings," as it is termed, is carried on step by step until now no tailings are made that will not pass through a 1 to 1 1/2-millimeter screen. Various types of machinery for fine crushing have been designed. Chili mills of different forms have been tried, but so far Huntington mills are used in preference to the other types. Small (3 1/2-foot) ones were first used for fine grinding in Butte in the lower works of the Boston & Montana Co. in the summer of 1884. Five-foot mills were tried at the Butte & Boston concentrator in 1887, but the first ones made were too light. Their mechanical construction has been continually improved and their capacity increased. At the new works of the Washoe Co. 6 foot mills are used that were designed in the engineering department of the company.

With this fine crushing it was found necessary to adopt machinery for the further separation of the values from the slimes made in mining and concentrating the ore. Poorer slimes were continually being made as material was crushed finer. Tables of the Evans type were used in order to make this separation. About the same time Frue vanners and Rittinger tables were introduced. The latest development in the treatment of slimes is the use of shaking tables of different types, such as the Wilfley, Overstrom and Cammett. These are a development of the old Rittinger table, which was used in early Butte practice. The capacity of the machinery used in the reduction of the ore has been constantly increased until now each section of a concentrator will treat 800 tons of ore, compared to 25 or 100 tons, as in the first mills.

Steam stamps were used by the Anaconda Co. and the Butte Reduction Works, this being an adaptation of the Lake Superior practice to the reduction of ores. The great difficulty with stamping has been the fact that it made too large a proportion of slimes. This was early recognized by the different concentrator men.

In 1890 and 1891 the Boston & Montana Co. built their concentrator at Great Falls. At that time there was a question as to whether they would use stamps or rolls and crushers. One section of the mill was fitted up with the stamp and all necessary machinery for treating the ore; two other sections were fitted with rolls and crushers. Although at that time the mill was designed with reference to adopting steam stamps, later experiments showed that the crushers and rolls were better and the stamp was taken out.

The Anaconda Co. started to build their upper works in 1883 and 1884, using at first crushers and rolls; later substituting steam stamps. The repairs on the stamps are less as a whole than on the crushers and rolls, but the losses are greater, owing to the quantity of slimes produced. In the designing of the Washoe concentrator it was determined to use crushers and rolls entirely.

The next step in the reduction of the ore is the calcination, or roasting, of the fine concentrates. The first furnaces used for this work were reverberatory calciners, in which the charge had to be moved by hand from one end of the furnace to the other. This was a slow and laborious process, besides being very expensive. Owing to the high price of labor and the low capacity of the furnaces, which was only about ten tons in twenty-four hours, it was soon found necessary to adopt some mechanical means of stirring the ore. Quite a number of different furnaces were designed and patented for mechanical roasting. Some of the best known in the Butte district, of the open-hearth type, are the Pearce furnace, now in use at the Colorado Smelter; the Brown-Allen-O'Hara, in use at the Butte & Boston; the Keller-Cole and Gaylord at the Parrot, and the four-hearth Holthoff-Wetthey furnaces, in use at the Butte Reduction Works. Nearly every master mechanic and superintendent who was in charge of work at the different plants had a patent calciner. At Anaconda the original calcining plant consisted of twenty-eight reverberatory furnaces. In 1888, or about that date, two small Brueckner furnaces were installed in the upper works. These Brueckners gave such satisfaction to the company at the time that in the building of the lower works it was determined to install a complete Brueckner calcining plant, which was the largest of this kind in the world. It consisted of ninety-six Brueckner furnaces, 10 feet diameter and 20 feet long, their capacity being from twelve to fifteen tons

* A paper read by C. H. REPATH, consulting engineer new reduction works, Anaconda, Mont., at the Butte, Mont., session of the Mining Congress, Sept. 3, 1902. Specially reported for the MINING AND SCIENTIFIC PRESS. See illustrations on front page.

per day. Later on, the upper works were remodeled and forty more were installed.

Early in the history of the calcination of the Butte ores the opinion was advanced that a calciner would be designed some day in which the heat necessary for the desulphurization of the ore would be obtained from the ore itself. This was first accomplished by the introduction of the Herreshoff furnace in the Montana Ore Purchasing Co.'s plant in Butte, about the year 1896. Small calciners, about 10 feet in diameter, having five hearths, were built and successfully operated. This was quite a step in mechanical roasting; still the capacity of the furnaces was small. Shortly after the introduction of the Herreshoff furnaces in this plant, the question was taken up by the Boston & Montana Co., at Great Falls, of designing a furnace that would have greater capacity and less repairs than the Herreshoff. A roaster was built on the same lines, 16 feet in diameter, and called the McDougall, having an air-cooled shaft and solid cast iron arms; this furnace had eight hearths. It was tried, but was not very successful, on account of the long arms and rakes. The heat developed was too intense for the cast iron arms, and they bent down under their own weight. It was then found necessary to cool them, and a design was made to use air; this was not satisfactory, and later a water-cooled shaft was substituted and the number of hearths reduced to six. This proved very successful, and, with the development of the mechanical details, the McDougall furnace stands to-day pre-eminent as an automatic calciner as far as repairs and cheapness of operation are concerned.

In early times it was necessary to calcine the ores for use in blast furnaces; this was done by means of "heap roasting." It was due to the gases produced by these heaps that the smoke of Butte became notorious. The blast furnace practice of to-day was not known at that time. To desulphurize the rich ores, large heaps—practically dumps of ore—were built over a layer of wood about 2 feet deep and fire started. This heat was sufficient to ignite the sulphur in the ore; by and by the whole mass became heated and the sulphur was driven off. It would take a month or more to roast a heap, depending upon its size. A slight improvement was made in the method of taking care of the smoke by the construction of stall roasters. The stalls were about 8 feet long and 6 feet wide, arranged in two rows with flue between, this flue being connected to a stack. This is still a good method where blast furnaces are used and there is no converting plant.

The first smelting done in Butte was in reverberatory furnaces at the Colorado Smelter, about 1880, when Mr. Williams built two furnaces having hearths about 9 feet wide and 14 feet long, using cordwood for fuel. These furnaces were charged by hand, the roasted ore being wet down and then shoveled into them from the side doors. If they smelted from twelve to fifteen tons in twenty-four hours they were considered to be doing good work. At the old upper works at Anaconda the first furnaces built were 10 feet wide and 16 feet long. They were also fired with wood and charged by hand. Each furnace had an individual stack. It was soon found necessary to increase the size, and so they enlarged step by step until in 1889 they were something like 12 feet wide by 18 feet long and the capacity had been increased to thirty or forty tons per day. The dimensions of the furnaces were further increased in width and length and this necessitated different means of charging, so hoppers with bottom gates were placed above them into which the charge was dumped; corresponding holes were made in the roofs of the furnaces; these were covered with brick slabs. The tramping of the ore to the boppers was done by hand and with small cars, and it is the method in use at most of the plants to-day.

In 1899 the Colorado Co. built a furnace that was 20 feet wide and 50 feet long; the Butte & Boston Co. built one like it at the same time. These furnaces have been quite successful and are the size adopted at the new works of the Washoe Co. One of the late improvements made in the mechanical construction of furnaces is the substitution of heavier binding irons and 12-inch brick in the roofs in place of the 9-inch formerly used. These furnaces have a capacity of 100 to 150 tons in twenty-four hours, as compared with the original 12-ton furnaces.

In 1890 and 1892 the Boston & Montana Co., at Great Falls, introduced gas fuel for the smelting of ores. Eight open-hearth, steel-tilting furnaces and a number of Welman gas producers, for the making of gas from Sand Coulee coal, were installed. The furnace at that time was 17 feet long and 13 feet wide in the hearth. It was necessary to use gas for the smelting of the ore, as the coal that could be obtained in that district was too low in quality to permit of direct smelting by means of the standard reverberatory furnaces. In 1895 they built a stationary gas furnace 30 feet long and about 12 feet wide. This did more work than the small ones, and, later, the size of the furnaces was increased, until now they are 43 feet long and 16 feet wide, the capacity being increased from 40 to 150 tons in twenty-four hours. During this time mechanical improvements were being made both in furnaces and gas producers. After the installation of the Welman, a number of Taylor producers were installed; but both types were superseded by a mechanically stirred producer, designed

and developed by the engineers of the company.

In disposing of the slag the first practice was to skim it from the furnaces into sand beds, the same as pig iron was originally cast; the slag was then loaded into barrows and wheeled out to the dump. The building of larger furnaces necessitated quicker methods of disposing of the slag than wheeling it, and in the year 1888 the Anaconda Co. introduced in their lower works the granulating method. The slags were skimmed from the furnaces into launders, from which they dropped into a steam of water that carried them away; this was a great step in the disposal of slags, but it is only possible at plants situated like those at Great Falls and Anaconda, where there is ample water supply. In the Butte plants other methods are used.

As the slag dumps increased in extent and the wheeling of slag became more expensive, large slag-pot cars were designed that would hold from five to eight tons, using horses for pulling them to the dump, where they were emptied by means of hand gearing. The application of electricity to this work was introduced at the Butte Reduction Works, followed by the Montana Ore Purchasing Co., Parrott Co. and Colorado Smelting Co. The Butte & Boston Co. were still moving their large slag cars with horses until the year 1899, when they adopted electric motors.

The matte from all the old plants is cast direct from the furnace into molds sufficient in number to take the full charge. In early days a furnaceman thought four tons of matte was a good tap, but now they often tap forty to fifty tons at one time; this may represent the metal of one or more days' smelting. The Boston & Montana Co., at Great Falls, introduced the practice of taking the matte direct from the reverberatories to the converters; in this case only five to ten tons are tapped at a time. At the new works of the Washoe Co. the matte is tapped into large fifteen-ton ladle cars, and then taken in a molten condition directly to the converter plant and charged into the converters, or storage furnaces.

Not the least interesting development in the progress of modern copper smelting is the utilization of the waste gas from the reverberatory furnaces for generating steam. This has been common practice in iron blast furnace smelting, but was not applied to reverberatory furnaces, smelting sulphide ores, until within the past two years. The results were very gratifying, so much so that arrangements are being made to build a boiler in connection with each furnace at the Washoe works. The time is not far distant when all the boiler power required to run a whole smelting plant will be generated by the waste gases from the furnaces, utilizing the heat from the sulphur as well as the gases from the coal used in smelting the ore.

The first blast-furnace smelting that was done in Butte was near the site of the Parrott mine, and was said to be in an experimental brick furnace, using a blacksmith's bellows for blower. In 1880 the Montana Copper Co., in their upper works, started their first blast furnace. This furnace was made in Denver, and was said to have cast iron water jackets. Connections to the tuyeres were made in heavy canvas tubing. Air was furnished by a small Baker blower.

The first steel water-jacketed furnaces were built for the same company, and were about 36 inches by 84 inches, with six tuyeres on each side. The ore and flux was dumped into small open bins near the furnace. The charge was made up by the furnaceman shoveling the required quantities into a barrow that stood on a charging scale. This was dumped at the door of the blast furnace, where it was shoveled into it with the necessary fuel, said to be charcoal. The capacity of the furnace was only about twenty-five tons per day, and matte and slag were alternately tapped from the crucible of the furnace; this crucible was deep and provided with separate matte and slag tap holes. The matte was tapped into pots, and then taken to the casting floor and cast into molds. Afterwards the deep crucible was discarded and a forehearth was substituted, and a continuous flow maintained from the furnace into the forehearth, or settler. These were made movable, so that when they chilled solid they could be taken away and new ones substituted.

In the year 1894 a new blast furnace, 36 inches by 120 inches, was built for the Boston & Montana Co. at Great Falls. At that time it was determined to try a larger settler—one that would hold sufficient matte to charge a converter; this settler was about 10 feet in diameter and 10 feet high. It was thought at first that the matte would chill so that it could not be tapped, but this difficulty, with others, was overcome, until settlers as large as 16 feet in diameter and 10 feet high were constructed, having large settling capacity for separating the slag and matte, at the same time holding sufficient matte to charge one or more converters. In 1896 plans were made for a large blast furnace, 42 inches wide and 180 inches long, and about 30 feet from charging to tapping floor. This presented a good many problems in mechanical construction, necessitating a double set of water jackets, each 10 feet in height and 7 feet 6 inches in length, with all necessary piping, tuyeres, etc. Flexible water connections of rubber hose were made instead of rigid piping to take up the expansion of the furnace. This furnace, on account of metallurgical difficulties, was not a decided success, and

another was built, 24 feet from charging floor to tapping floor, the upper and lower jackets being made 3 feet less in height. Various experiments were made to determine a satisfactory width and inside taper, and finally one that was 54 inches wide and 180 inches long was adopted as standard. Such deep furnaces necessitated higher blast pressures; instead of 16 to 20 ounces, as in the old furnaces, pressures of 30 and 40 ounces were used. This required blowers of larger capacity and greater strength.

With the construction of large furnaces the capacity was so increased that the ordinary methods of charging with wheelbarrows and shovels was found to be too slow and inadequate, and so cars and narrow-gauge trucks were installed. Charging scales were placed in the tracks in front of the storage bins, and the material weighed as loaded on the cars. These cars were designed so that the body of the car could enter the furnace, dropping the charge without shoveling. A train of these cars is hauled from the storage bins to the furnaces by an electric motor. The charging doors of these furnaces were so large and heavy that it was found necessary to move them by power; at the Washoe works the doors are lifted by air, while at Great Falls hydraulic power is used. At the Washoe Co.'s works standard-gauge tracks are used, which necessitated a new design of car and method of charging. The capacity of these furnaces is about fifteen times that of the small one first used. Some years ago, at the Butte & Boston, a method similar to those in use at the iron blast furnaces was tried. The charge was dumped into a hopper with a bell in the bottom, located above the furnace; at the proper time the charge was dropped into the furnace. This did not work satisfactorily and was discarded.

There has never been devised a satisfactory method of treating fine material on account of the quantity of flue dust made in roasting and smelting. Large dust chambers and flues have been built to catch the dust, but still with the draft required in the furnace a large amount of it is carried out into the atmosphere. Even the flue dust that is caught in the flue chamber is hard to smelt in reverberatory furnaces. In later years some attention has been paid to pressing this material into brick form, using lime as a bonding material.

Two types of machines are used in the work and the working of the material is made as automatic as possible on account of its low values. The briquettes at first were allowed to dry in the air, but this was too slow. At the Washoe works mechanical methods of handling as well as drying them are used. The briquettes after they are dried are hard and compact enough to smelt in a blast furnace. This is probably the most complete plant for briquetting flue dust and slimes at any copper plant in the world.

In 1880 Pierre Manhes made a successful application of the Bessemer process to the treatment of copper matte. In the fall of 1884 the Parrott Company erected the first converting plant in Butte. They were stationary converters and had to be lined in place. They were tilted by hand power by means of worm-wheel gearing. Later they used belting and power transmitted from a line shaft. These converters ran from 1884 to 1890, when they remodeled the plant and substituted interchangeable converters operated by hydraulic power instead of belt transmission. Instead of lining converters in place a car with an adjustable top was used for transferring the converters to and from the stalls and for placing it in exact position for the air connections; these cars were run into the lining shed and the converters were transferred by jib cranes to the lining platform where they were relined. The material for lining was first crushed by crushers and rolls and then mixed and tamped into the converters by hand. Matte for the converters was furnished by an independent cupola set in front of three stands. From this cupola a swinging spout carried the matte to the converter. At first it was believed that only a high grade matte of about 70% could be reduced.

In 1888 the Anaconda Company built two small experimental stationary converters and set them on four-wheel trucks. These trucks were moved in and out of the stalls on tracks. They were tilted by hand and in much the same manner as large slag or matte ladles are tilted to-day. They were about 4 feet diameter and 7 feet high. In lining, it was necessary for the man to enter the converter head first to finish the claying, which was exceedingly uncomfortable and inconvenient.

In 1890 Otto Stallman, who was at that time the superintendent, designed a stationary converter of a slightly different shape to that used by the Parrott Company. Twelve of these were installed in the upper works and were run for about four years. In 1892 they built their present old works converter plant, using the Parrott type, making it 6 feet diameter and 10 feet high.

In 1892 the Boston & Montana Company in building their converter plant adopted practically a steel converter that was 7 feet diameter and 13 feet high, and was the largest in use at that time. Later, in the erection of the Butte & Boston converter plant, a converter known as the "barrel" type was adopted. With this less blast pressure is required than in the upright converters.

At the Washoe Company's works, designs were

made in the engineering department for a still larger converter of the harrel type, 8 feet in diameter and 12 feet, 6 inches long, weighing when charged about sixty tons. The matte is tapped directly from the reverberatory and blast furnaces into fifteen-ton ladle cars and taken to the converter plant by compressed air locomotives. The matte is poured into a hopper from which launders carry it to the converters.

Air hammers were first used in 1895 for lining converters at the Boston & Montana plant at Great Falls, using fifteen pounds air pressure. This reduced the cost of the linings and increased the efficiency of the converters. The same machine was adopted by the Anaconda Company. The harrel converter does not permit of the use of this machine, so the Butte & Boston use a small air hammer, suspended from an overhead crane, the same as is done in foundry practice. At the works of the Washoe Company the Ingersoll-Sergeant drilling machine, suspended from a crane, has been adapted to tamping the converters.

The methods of handling the slag from the converters vary in the different plants. At the old works of the Anaconda company the slag was poured into small pots and then taken to the platform to cool, where it was hoisted by a platform elevator to the charging floor of the blast furnace and charged directly. At the Great Falls plant the usual practice has been to pour the slag from the converter into a ladle, then into sand beds, where it stays until cooled sufficiently to break easily. These slag blocks are broken into large pieces by an ordinary drop weight handled by a crane. If the slag thus broken is too coarse for use in the blast furnace, it is further broken by the men with hammers and then taken to the blast furnaces. At the Butte & Boston and other plants the greater quantity of molten slag is poured directly into reverberatory furnaces, only the skulls being broken up and taken to the blast furnaces. The amount of this material required as a flux in the blast furnaces determines the amount poured into the reverberatory furnaces. The conditions existing at the different plants govern the practice of disposing of slag. At the works of the Washoe Company slag is poured into large ladles and then taken by the crane to a pouring stand where it is poured into a steel pan conveyor. In passing out and up to the storage bins the slag is cooled by water and dumped automatically into the bins.

The copper in some of the plants is poured from the converters into molds on cars, either into pigs or hars weighing 200 to 250 pounds, and shipped in this form to eastern refineries. At Great Falls part of it is cast into anodes for the electrolytic refinery. The copper at this stage is about 98% to 99%, but still carries the gold and silver contents of the ore besides other impurities. The greater percentage of these impurities in the converter copper is taken out by re-melting the metal in a reverberatory furnace and then casting into anodes for the electrolytic refineries, or into casting copper if the gold and silver values are low. The anodes made in this manner are preferable to those cast from the converters, as they contain less impurities to be disposed of in the electrolytic plant.

In 1897 the Anaconda Company constructed a tilting furnace out of an old Brueckner roaster, and the copper was poured from the converters into a ladle and then into a furnace in a molten condition. The copper from this furnace was cast into anode molds set on two-wheel trucks. When loaded they were wheeled out to the railroad cars and dumped, and the anodes shipped to the electrolytic refinery. Later on three more tilting furnaces of improved type were installed and were very successful.

At the Washoe Works stationary refining furnaces capable of holding from 120,000 to 150,000 pounds of copper were installed. A casting machine is placed in front of each furnace. The copper runs from the furnace into a small tilting ladle and is poured into the molds on the machine. Hydraulic power moves both ladle and casting machine. The molds and copper are cooled by a spray and then are pinched out of the molds by men standing at the end of the machine. The copper then goes into a hosh in which there is a conveyor partly submerged in water, where it is further cooled, and is then brought out and dumped onto the floor, when it is weighed and loaded for shipment.

The last process in the refining of copper is the electrolytic, in which the gold and silver and the remaining impurities are separated. The method is electrical and chemical, and yet mechanical appliances enter largely into the work. The principal improvements of later years have been greater economy in the production of power by the use of larger generators, direct connected to water wheels or engines. The problem is to produce cheap electrical energy in enormous quantities.

In the early days the only power required in treating the ore and making matte was in concentrating and blast furnace smelting, but principally in concentrating. Steam was carried in the boilers at 60 to 80 pounds and a 100 H. P. engine would do all the work. Now steam and electric power is applied in every department. Concentrating requires more power. Mechanical roasters require it, reverberatory smelting requires it for furnace draft, blast furnace smelting needs more, and converting takes enormous quantities for compressing the air re-

quired. But while we use vastly more power, yet we produce it for less money, because we use steam carried at 175 and 200 pounds pressure, and use it in triple expansion 1000 and 2000 H. P. engines, in direct connected 375 H. P. compound engines and blowers, and in triple expansion blowing engines, all running condensing. The Washoe plant with its 10,000 H. P. equipment has not a pound of steam going into the atmosphere, but all the heat that can be is used in accomplishing work.

I have tried to show that the great progress and development in mining and smelting in the past twenty years is due principally to the perfection of the mechanical appliances and their adaptation to the problems that enter into the production of copper, and also that the mechanical engineer has won a name and place for himself second to none in importance in the field of modern copper mining and smelting.

Application of Geology to Mining.*

There was formerly a wide gap between the scientific geologist and the practical mining man. Neither understood enough of the other's work. The geologist, secure in his knowledge of some scientific principles, was amused at the many blunders and crude theories of the prospector and miner; and the miner, keenly alive to the pedantry of the college professor and his frequently obvious ignorance of things as they really were in nature, was inclined to scorn the man of science.

It is not to be denied that this lack of human sympathy was chiefly the fault of the geologist. Geology is a new science, and mining geology, as we now understand it, is very young; and let us say thirty, forty or fifty years ago there was not nearly so much known on the subject as now. Yet many of the scientists of that day may have been tempted by vanity or money to go beyond their scope and to make confident predictions and conclusions in regard to ore bodies; and these predictions were often on entirely insufficient grounds, as was in many cases soon proved by actual mining. This genus of so-called mining experts is yet alive and even relatively numerous, but they are coming to be recognized as having the same standing in their profession as the quack traveling doctor does in the medical world. One may have sad experiences with fake doctors, yet he will not scorn the services of the competent specialist; and so it is now in mining geology.

The present close and ever-progressing amalgamation of geology and mining into mining geology is due to the simultaneous progress of both. The perfection of the principles of mining have been brought about by diligent research into every branch of the subject. Happy-go-lucky methods are falling into disfavor, and everything is being brought as far as possible to a scientific basis. So the intelligent miner has come to realize that the geology of his mines is a complicated and valuable science, the advantages of which are grasped only by the most persistent study.

At the same time, geologists have been making rapid progress during the last few decades toward a complete understanding of those departments of geology especially connected with ore deposits. The old-time geologist was paleontologist, petrologist, stratigrapher and philosopher, and was ready to consider himself a mining geologist during his leisure moments. The modern geologist, with the necessary previous training in the other branches of geology, devotes his chief energies to his chosen work and succeeds in becoming practical as well as theoretical, just as the modern miner has succeeded in becoming scientific as well as practical.

This development, though strongly marked in Europe, has nowhere had a more rapid growth than in the United States. The refinement of mining methods which has put the American miner in the foremost rank, has led to his calling for help to solve the knotty geological problems of the mines. First, it has been the U. S. Geological Survey which has responded to the call and has sent its men to help the miners in their study, and to receive as their recompense a more profound acquaintance with their own specialty. This work has been greatly increased of late years and is constantly being enlarged. The names of Hague, Emmons, Becker, Ransome and many others are familiar to the mining world.

The successful mining geologist must have a thorough acquaintance with the principles of geology, and at the same time understand the general principles of mining; and he must be able to judge nicely where the two come together. Every miner is by force of necessity a geologist, for no matter what his work, he is constantly obliged to confront geological problems; but as his knowledge and training are apt to be too slight, his deductions and theories are apt to be wrong. There is no bolder theorist than many a practical miner. I remember having had told me by a prominent western mining man, now dead, that a certain fault was no fault because it had slickensides along it. He said he never knew slickensides to occur along a fault. Now, wrong geological principles, crudely deduced or only imagined, are among

the most dangerous things to successful mining, but carefully reasoned out by a trained and experienced mind, they are essential to proper exploitation.

One does not ordinarily realize how often the most unlikely principles of geology have highly important economic applications. A general knowledge of the nature and origin of sedimentary and igneous rocks, of the process of erosion and deposition, of movements within the earth's crust (producing folding, faulting and mountain making), of the chemical processes carried on by waters and vapors at the surface and underground—even the study of land forms and in what ways they were produced—these may all have their bearing.

It is important to understand the fact that in a series of different rocks ore may come to be deposited in certain beds in preference to others, and one must understand the reason for it. The bed in question may be porous, like a sandstone, and therefore afford a channel for circulating metal-bearing waters and provide open spaces for the deposition of minerals from them. Or the stratum may be especially impermeable to water, so that mineralizing solutions, either ascending or descending, cannot find a passage, but spread out above or below and there deposit what they carry. Such is the case with some compact shale beds. Or a stratum may be otherwise especially fitted for the deposition of minerals, as a bed of limestone, which in certain cases is very susceptible to replacement, and so would be chosen in preference to more refractory rocks. Or a stratum may have some other chemical peculiarity which will precipitate the contained metals from traversing waters. For example, a bed containing organic matter will often reduce ore deposition; a bed rich in iron may precipitate gold from solutions.

It is important to be able to distinguish between a bedded ore deposit, contemporaneous with the sedimentary rocks in which it occurs, and one of subsequent introduction. In the first case the ore will invariably follow its regular horizon, while in the second we must be always expecting it to deviate or occur in other forms. The latter caution must be maintained in regard to those original bedded deposits which have undergone secondary concentration by circulating waters. Such waters, besides concentrating the ore within the parent bed, are likely to carry it out and form ores at a greater or less distance away from it.

Where ores occur in bed form it is important for the miner to be able to trace and recognize the same bed in different places. Ore-bearing strata sometimes extend as such for long distances, as is the case, for example, with the iron-bearing stratum of the Mesaba range, in Minnesota, or it may be of limited extent, the ore disappearing with some change in the physical or chemical conditions. The relation of an ore-bearing bed to other beds lying above and below should be studied. Often, where the important stratum is not exposed at the surface or concealed by debris, the recognition of a bed having a known relation to the ore bed leads to the discovery of the latter and its contained ore deposits.

Some knowledge of fossils is often of value for the recognition and tracing of a stream containing valuable minerals, especially in separated districts. This is so because beds having the same physical appearance may and do occur in many ages, while perhaps only in one were the finer conditions for producing deposits of valuable minerals fulfilled.

Passing to the study of igneous rocks as applied to ore deposits, we find a field of some importance. In fact, it is even true that miners have always been disposed to give to different varieties of igneous rocks a significance as regards ore deposits which they have hardly deserved. The proper identification of such rocks is a puzzle to the miner. It is necessary to be able to distinguish an igneous from a sedimentary rock, and this can in most cases be easily done. But the finer distinctions are generally of slighter importance. Formerly, the knowledge of igneous rock was much less than now. To take a single example: Baron Riechthofen described propylite many years ago as one of the principal volcanic rocks at the Comstock lode. On account of the association of this rock with the wonderful mineral riches of the Comstock lode, it became a favorite with miners, who called everything propylite that they possibly could. Since then the investigations of Becker of the U. S. Geological Survey and others have shown that the rock is simply an altered andesite.

All this may appear to be really on the subject of what a knowledge of igneous rocks can not do. But you must remember that it takes a profound knowledge of those rocks to know what they do not stand for as well as to know what they do stand for.

A general knowledge of the broader rock divisions, such as the granitic, dioritic, diabasic and peridotitic rocks, is necessary to the finished mining man. It is proper to know the general distinction between the rhyolitic, andesitic and basaltic rocks. Terms like porphyry, syenite, trachyte, phonolite, amygdaloid, dolomite, felsite, greenstone and serpentine are used daily by the miner, and he should know exactly what he means when he uses them. He should know that igneous rocks occur either in fundamental great bodies or are intrusive or are poured out on the surface as lavas.

It has long been a matter of observation that there

* A paper read by J. E. SPURR at the Butte, Mont., session of the Mining Congress, Sept. 3, 1902. Special y reported for the MINING AND SCIENTIFIC PRESS.

is the very closest connection between most igneous rocks and ore bodies. Probably nine out of ten ore deposits have some visible connection with a body of igneous rock. In general, also, a country free from igneous rocks has a scarcity of ores. There are reasons for this relation.

Of the different forms of igneous rocks, intrusive rocks are perhaps the most favorable for bringing about ore depositions. A study of the conditions of ore depositions with igneous rocks will show that ore bodies should be chiefly expected along or near the contacts, especially those of intrusive rocks; after these the past or present channels of water circulation should be investigated.

There are some metals that show a preference for igneous rocks. This is a point upon which we are continually gaining new information. Chromium ore deposits are hardly found, save in very basic dark rocks, such as peridotites. Platinum is chiefly found in place in similar very basic rocks. Tin, on the other hand, is always found in or in connection with granite. I believe that gold in the form of gold quartz shows a decided preference for siliceous rocks, especially granites.

Let us turn to the study of dynamic and structural geology—the consideration of the forces which produce changes and movements in the earth's crust. One of the most important forms of movement is the bending and breaking of rocks, particularly noticeable in strata. The study of the arrangement and structure of these bent and broken rocks is very important in mining problems.

For example, if a certain bed is ore-bearing, it is of great use to be able to trace it after it has been folded and faulted. Any ore body may be more or less completely faulted, and the recovery of the ore body beyond the fault plane is one of the chief puzzles of the miner in many districts. But this is not always an easy thing to do, as many can testify. We cannot look into the earth and see all the folds and faults. We have only certain rock outcrops at the surface, certain data in the mines, and from these we must construct the whole as near as we can. For mining purposes, measurements and calculations must be as accurate as possible.

In these Western States it has seemed to the writer that in some districts at least nine out of ten shafts and tunnels have had no result, and probably eight out of the nine would not have been begun had the promoters some idea of the geological structure and the nature of the ore deposits in each particular district. A rich mine is struck somewhere; the surrounding land is taken up; the district is boomed; capital pours in and before you know it the country is full of holes. Then the boom subsides, the holes are abandoned; the few intelligent or lucky men open their mines and the district settles down to the humdrum of a steady producer; but in many places it appears to the observer an open question as to whether more money has been sunk in the ground or taken out of it.

Some geometrical conceptions must be cultivated in this department of mining geology. Take, for example, the comprehension of the attitude of a vein or bed as judged from its surface outcrops. The uneven surface cuts beds, dikes, faults or veins at all angles, and the intersections, which constitute the outcrop, are infinitely varied. A bed or fault having a straight strike may have an outcrop which will describe all kinds of curves as represented on the geologic map. On cross-sections, faults are generally represented as cuts in a vertical vein plane; but the real displacement may be in any direction, and sections to show this must be made in a plane which includes the line of movement. So firm is the old incorrect idea of a fault being a vertical movement in the stratified rocks that I have heard people doubt whether a differential movement along a bedding plane was a fault at all. The absurdity of this idea is apparent. Suppose that the bedding fault cut and separated an ore body, would the mining engineer have any doubts about its being a fault then?

It is economically important also to determine the relative ages of faulting and ore depositions in each case. Complicated instances may happen. To take a not too difficult example a period of faulting may occur, followed by ore deposition which may be partly along the faults; then a second of faulting may displace the ore bodies and also the earlier faults.

If an ore deposit has been formed before folding and faulting, then the displacement of the rocks affect to the same extent the ore bodies, and the continuation of ores interrupted by a fault can be confidently predicted at the same horizon at the other side. If the opposite is true, then no such calculation can be made. The ore bodies will be unbroken, and although they may be interrupted along the fault lines, for reasons connected with their depositions, yet their continuance on the other side can not be assumed.

A specially complicated and very likely case is where faulting and folding go on for a long time slowly and contemporaneously, with a continual slow process of ore deposition. The first ore deposits may be subsequent to the first faults and folds, but they will be disturbed by the latter movements; yet these latter faults may be chosen as the focus for newer ore deposits. These may be broken by still more recent movements. In such cases, only careful examination can direct exploitation most economically.

Where two water courses intersect, he these courses two faults, two joints, the intersection of a joint or fault, a joint or fault with a porous stratum or anything else, there the ore is likely to be most freely deposited. This is the explanation of most ore shoots or chimneys.

The application of geology to placer mining is also varied. In 1896 I was in the Yukon country where the rivers have cut down through an old plateau, leaving at various heights terraces which are portions of former valleys. I reasoned that since the present beds of these streams contain gold-bearing gravels the terraces must also be auriferous. In my report, published by the United States Geological Survey, I advised miners to prospect these high terraces, and since then many profitable bench diggings have been found.

In conclusion, I may be allowed to repeat that often the combination of the most abstract geological principles may lead directly to results of the most practical kind, with a direct bearing upon mining.

First Aid to the Injured in Mining Accidents.*

The causes of mining accidents are too numerous and varied to permit of a distinct classification. Those most constantly operative are falls from roof and sides, use of explosives, foul gases, operation of hoisting and traction machinery, explosion of inflammable gases (coal mines), traversing ladder ways, placing of timbers. Under the term miscellaneous may be grouped all others which contribute in any degree to the production of accidents. While many accidents from the nature of things are unforeseen and unavoidable, it is to be regretted that a certain percentage far too great is due to either carelessness or disobedience of the rules established for the protection of all, including those who habitually transgress them. It seems almost incredible that men should persist in dangerous and forbidden practices which imperil the lives of others as well as their own merely to save time or avoid a little additional work, yet this is often done with no apparent concern as to what may happen in consequence. This indifference to danger is perhaps not intentional; constant exposure without injury begets a disposition to underrate the liability to accident and the necessity of guarding against them. This fact, however, does not excuse one who commits a rash act or who by negligence sacrifices the lives of his fellow-workman instead of contributing his share to their preservation by more careful attention to duty. The most reliable guarantee of safety must be based upon the practical knowledge possessed by the miner himself. He is expected to understand the nature of the ground in which he works, the proper manner of breaking it, the support required during and after the extraction of the ore, the precautions to be taken for the safe handling of explosives, in short the whole procedure is in his hands and the safety and efficiency of the work depends upon the skill and judgment exercised in its accomplishment. Self-protection is a matter of individual responsibility in so far as the immediate surroundings are concerned and should be the first consideration in all that is undertaken. The conditions which pertain in mining differ materially from those that exist in ordinary labor above the surface of the ground. The miner, for instance, must work by the aid of a candle or safety lamp, and such light may prove inadequate for the close inspection of loose rock in the roof and sides of levels and stopes, and unless special care is taken dangerous indications may be overlooked even by a careful and competent observer.

These are some of the common and ever recurring situations under which the work is done. Something more than the mere ability to perform manual labor is demanded; there must be skill to direct and govern every act; mistakes are perilous by the swift and destructive consequences which may follow. To become skilled as a miner an apprenticeship more exacting than that practiced for the various trades must be accepted as the true method of training.

Looking a little further into the causes of mining accidents we find an appreciable number chargeable to the use of explosives. The agent most generally employed is nitro-glycerine, known to the trade as dynamite or giant powder. This substance is reasonably safe at a moderate temperature and under ordinary atmospheric conditions, but is always to be regarded with suspicion and few liberties taken with it, as no one can as yet determine the exact explosive point at any time or place, much less the influences which lead up to it and induce a state of extreme sensitiveness which responds to the slightest jar or vibration. It possesses the disadvantage of readily congealing at a lowered temperature, necessitating the application of heat to expel the frost before using. This latter process is a source of real danger and ought not to be trusted to inexperienced hands or to any one for that matter without the proper appliances for regulating the heat to safe limits. The method which gives the best security is that by which a mod-

erate and uniform temperature is maintained, the placing of a competent man in charge of the process whose duty it is to supply the miners with powder and fuse upon requisition. Accidents which occur while charging the holes or from mistakes in length of fuse, neglect in signaling, defect in arranging facilities for retiring to a safe distance, are for the most part preventable and the fault lies with the workmen themselves.

The equipment of shafts operated by means of cages has been so well perfected that comparatively few accidents are noted if we take into account the amount of work done and the number of men transported to and from their work from month to year in the various mines that are in active operation. When an accident does occur in connection with the working of a shaft it is usually a serious one. The parting of a cable, the sudden giving of the brake upon the hoisting engine, a failure of safety clutches, overwinding and precipitation of the cage to the bottom of a deep mine—any one of these unfortunate mischances must necessarily be attended with loss of life.

In sinking winzes and working shafts in the less pretentious mines, buckets are used to convey men and for general use in hoisting. The bucket when working without guys is not under absolute control, and when propelled at a high rate of speed assumes a rotary motion, which is apt to cause vertigo in some individuals to such a degree as to render them incapable of retaining their grasp upon the cable, as in one instance coming to the writer's notice, that of a miner falling from a bucket in making a descent of 200 feet in a vertical shaft. No other cause could be assigned. Closing the eyes tightly will in a measure counteract the sensation of vertigo and prevent accident.

The speed should, however, be regulated within reasonable limits. The practice of riding upon a loaded bucket is unsafe and should never be done. Here is a case in point: Two miners were riding upon a bucket in which some pieces of lagging were being hoisted; neglecting to lash the top of the poles securely they came in collision with one of the timbers of the shaft, the cable was broken and the bucket, with its contents, was precipitated to the bottom with fatal results.

Other cases might be cited to prove that the practice referred to is a dangerous one, but the fact is too apparent to need further comment.

The handling of heavy timbers has its quota of mishaps, such as the breaking of ropes, slips and sliding ground risks that are usually unavoidable.

Machine drilling in mines is not especially dangerous. The few accidents that come under observation happen while setting up the machine or from the giving away of ground upon which it stands. Small particles of steel from the drill are liable to injure the eyes by becoming imbedded in the cornea. They are, however, readily extracted by applying cocaine, and using a magnetized instrument of suitable size. If the foreign body penetrates into the interior of the eye, the loss of that organ is a probable result.

Accidents met with in loading and coupling cars are usually of a minor class, and are in the majority of instances due to the want of care on the part of the workmen thus engaged.

Accidents from the inhalation of poisonous gases is a subject of special interest to miners, on account of their frequent exposure while working underground. The best ventilated mines are not entirely free from this danger, and as a consequence, miners are sometimes overcome by breathing gases collected or generated in stopes on recesses that cannot be wholly purified. Where good ventilation has not been provided, as in shafts and tunnels projected by prospectors, the danger is proportionally increased. The attempt to return too soon after blasting has occasioned loss of life. The introduction of compressed air as a motive power in the larger mines is of signal service in this particular. After blasting the air is turned on and the obnoxious gases driven out before the men resume their labor. The candle test for unsafe air is observed by miners generally. They know that an atmosphere too poor in oxygen to support the flame of a candle is unfit to breathe, and precaution must be taken to avoid such localities when it is possible to do so. They should also understand that this test is not infallible. There may be, and often is, an admixture of gases capable of supporting the flame from a candle, and yet deadly when inhaled. Experienced miners cannot have failed to note the behavior of the candle flame under these conditions. It flares up with a pale bluish light, due to the presence of a gas known as "carbon monoxide." It is one of the most poisonous gases with which the miners come in contact. A product of imperfect combustion, it is generated by the detonation of explosive compounds, and being colorless, odorless and tasteless, its presence is only made apparent by certain symptoms produced by its poisonous action, when introduced into the blood by continuous inhalation.

Associated with the ordinary carbon dioxide which infests mines in as small a proportion as 1%, it may prove injurious. A combination of the two gases seems to increase the toxicity of each other. Carbon dioxide is fortunately less active than the monoxide; moreover, it has a slight taste and odor and can therefore be more readily detected. The two gases are generally associated together, and the chief concern is to be able to determine when their percentage in

*A paper read by Dr. G. W. King, Helena, Mont., at the Butte, Mont., session of the Mining Congress, Sept. 3, 1902. Specially reported for the MINING AND SCIENTIFIC PRESS.

the atmosphere has passed beyond the limit of safety.

It is true that a difference exists among individuals in regard to their susceptibility to the action of these gases. One may be overcome in a place where another suffers but slight inconvenience. This fact often encourages the latter to take unnecessary chances. Men of experience and judgment, however, rarely go into a place where the air is known to be bad without being prepared to retreat promptly upon the first indication of danger. What these indications are should be as familiar to the trammer as to the miner himself, for it is among the former class that accidents from inhalation of foul air is most liable to occur. Their work necessitates the handling of loose earth, which is more or less permeated by the gas which is easily freed by the disturbance and becomes mixed with the air we are to breathe. Poisoning by carbon dioxide is at the time so insidious that the warning symptoms are unnoticed until too late to escape.

SYMPTOMS OF POISONING BY CARBON DIOXIDE.—The smell and taste of the gas is usually quite perceptible, and this indicates its presence when the percentage is small; nothing more than a dryness of the throat and a slight headache may be experienced. In large amounts the headache becomes more intense, a peculiar throbbing pain is felt over the brow and back of the head. Vertigo supervenes and the sight becomes dim and the limbs weak. There is a nausea and vomiting. An uncontrollable desire to sleep comes on and the person falls never to rise, unless carried out immediately. In an atmosphere completely saturated with carbon dioxide, these progressive symptoms are not noted, for the reason that all is over in a very few moments.

The result is practically the same as being submerged in water. To rescue those who are insensible a systematic plan of relief should be adopted. To rush in excitedly but complicates the work, very likely adding to the number already disabled. By forming a relay of men and instructing the one who is to enter to apply a sponge or handkerchief saturated with water or preferably with vinegar over the mouth and nostrils, then go quickly forward, take hold of the one insensible and drag him to the entrance as far as he can with safety to himself, then retire to give place to the one who stands ready to succeed him, will render the rescue work less hazardous to all concerned. Operating in a shaft is more difficult and dangerous. When the descent is made by a bucket for any considerable distance through a poisoned atmosphere, it is impossible to stand erect within it and maintain an equilibrium after the paralyzing effects of the gas is experienced. A sitting or kneeling posture should therefore be assumed to avoid the possibility of being precipitated from the bucket. Should descent by ladder way be undertaken, a rope fastened about the waist and manned from above is recommended as a wise precaution. A second rope may be lowered, if necessary, and made fast to the person to be brought up by means of a loop drawn snugly around the body close under the arms. The act of hoisting an unconscious person by the aid of a rope must be conducted with reasonable care, the tension ought to be steady, lest too forcible contact with jutting timbers or rocks result in serious injury.

The treatment of asphyxia produced by inhalation of poisonous gases will be referred to in appropriate connection.

The prevention of mining accidents has been the subject of much study, and investigation is continually being made by engineers and practical mining men. Legislatures have also endeavored to surround the miners with additional safeguards by legal enactments. Improvement has certainly been made, and with the advent of electricity for the purpose of lighting and motive power further progress will be made evident in the equipment of mines that are to be operated in the future.

Were it possible to exclude the accidents which are clearly preventable, the occupation of mining would be less hazardous and the mortality lessened, a result most helpful and worth striving for, since at best there will be fatalities enough and to spare.

Taking the practical view, then, that with the best equipment and most efficient service accidents may and do happen, the care of the injured must be considered with reference to their immediate necessities. To be prepared for emergencies is the first essential. This refers to the few medicines and appliances that may be needed for temporary use. These articles should be kept in reserve at the most accessible station within the mine, and plain and concise directions for their proper and legitimate indications posted in a conspicuous place, that all may learn how and what to do for others in case of need. To avoid unnecessary complications, the list of articles must be limited to the actual requirements, enumerated, it would appear, as follows: One-half dozen bandages, 2½ to 3 inches in width and 1 yard in length; one package of absorbent cotton; one roll of adhesive plaster; one dozen safety pins; galvanized wash bowl, soap and towel; temporary splints for the limbs; a litter; one cylinder of compressed oxygen gas, with inhaling mask; medicines other than stimulants are not indicated. Two ounces of aromatic spirits of ammonia, with a small flask of brandy, are added for the latter. The medicines and dressings may be stored in a

tin box with a tightly fitting cover, and the whole protected from moisture. After an accident the danger to be apprehended to those who are severely injured depends in a measure upon the length of time which must elapse before medical aid can reach them. This period varies from a few moments to several hours, according to circumstances. During this interval of waiting what is to be done? In some instances nothing; in others prompt action must be taken to save life. Upon those who are present, or first to arrive, devolves the duty of attending to the immediate necessities, whatever they may be, as best they can. The demoralizing effect of an accident upon those who witnessed it is apt to be harmful in two ways: First, by causing delay when time is the important factor; second, by inciting too energetic attempts at rendering assistance. It is, therefore, well to remember that, however alarming the situation, calmness and presence of mind are all-important.

Undue excitement contributes to render the chances of success less certain, if not impossible. One who is competent to do the right thing whenever and wherever such service is imperative exerts an influence most assuring and helpful to those in peril, and to those who must assist in their care. Gentleness without timidity is of inestimable value in this service under all conditions.

In caring for the injured there are certain things to do, applicable in all cases, and we, therefore, begin by placing the individual in a recumbent and easy position, and proceed to loosen the clothing about the neck and chest, and if the patient is able to swallow and there is no excessive bleeding, external or internal, from wounds or contusions, a moderate amount of whisky or aromatic spirits of ammonia may be given as a temporary stimulant. If stunned and unconscious, no attempt to give fluids by the mouth ought to be made, owing to the liability of their entering the windpipe and causing suffocation. Cold water may with advantage be sprinkled upon the face to excite effort at breathing. Friction applied to the extremities, being careful to select those which are injured, is a healthy measure. Heat applied externally is indicated when the surface of the body is cold and the circulation feeble. When reaction has become established the limbs should be examined, one by one, and in the same careful manner the chest, abdomen and head. In this way the injuries cannot fail to be noted. When there is dangerous hemorrhage caused by wounds and fainting from loss of blood ensues, appropriate means to control it must be employed promptly. To arrest bleeding different methods are employed, all more or less mechanical. Pressure is the readiest and most effective means for the temporary control in urgent cases. To apply the fingers over the course of an artery and compress it sufficiently to shut off the current of blood requires but an instant, and this advantage in time is not to be overlooked, especially when a large vessel is wounded.

Troublesome bleeding from wounds in the palm of the hand is effectually checked by similar methods. Digital compression of the large arteries of the thigh is more difficult owing to the large mass of muscles by which it is surrounded. Resort must be sought in more effective methods. The limb should be elevated and a small, firm pad placed over the artery, then a handkerchief or piece of rope is made to encircle the limb over the pad, a sharp stick introduced into the loop and twisted upon itself until the bleeding is effectually controlled.

Cold is an effective means of checking oozing from small arteries or veins. Ice, snow or cold water is placed in contact with the bleeding surface. Heat is equally serviceable, and is applied by means of compresses dipped in hot water. In deep wounds, when the source of bleeding is obscure and the condition of the patient critical, packing the wound with strips of gauze, or with absorbent cotton, is permissible. After removing blood clots the gauze or cotton is forced into the bottom of the wound, and the cavity filled and a bandage firmly applied to the parts. In these manipulations absolute cleanliness is to be insisted upon to prevent infection. The hands of the operator should be thoroughly scrubbed with soap and water, and the dressings kept free from contamination with as much care as possible.

Internal bleeding, induced by serious injuries, is, unfortunately, not amenable to active treatments, and we must content ourselves with insisting upon perfect quietude, administering cool drinks, and applying cold compresses over the affected region. These simple means may appear insignificant and of doubtful utility in the presence of grave conditions, and the temptation to do something more radical in the way of treatment is at times difficult to resist. A moment's reflection upon the indications to be met should establish the fact that the immoderate use of stimulants or active movements of the patient tend to deviate the object we have in view, viz.: to favor the formation of a clot at the point of rupture of the artery or vein—nature's method of arresting hemorrhage; fainting is a saving incident and may be so regarded, unless the weakness is progressive and the shock so profound as to threaten immediate death. In the latter emergency, stimulation and warmth must be the treatment. It is to be understood that surgical skill is required to deal with such extreme cases. The suggestions above outlined

are for the benefit of those who are uninstructed in the treatment of severe injuries. First aid applies only to the temporary care of those who are disabled and helpless; with that its utility ceases. Some injuries disable without endangering life, as instances in the case of fractures of the limbs. Here some support is needed to steady the fragments during transportation. The resuscitation of those who have been overcome and rendered unconscious by inhalation of poisonous gases is necessarily first aid work. The question of how to accomplish this object must be considered. Little can be done before removal to a location where the air is comparatively fresh. Then cold water dashed into the face and friction applied to the limbs will stimulate the resumption of breathing. Should it fail to do so, artificial respiration must be resorted to at once. It consists of forcing air into the lungs by imitating the natural act of breathing. The steps of the procedure are as follows: Place the patient upon his back with head and shoulders slightly elevated; loosen the clothing and cleanse the mouth and nostrils; pull the tongue forward and bring it out at the angle of the mouth, to remove all obstruction to the entrance of air. The operator then kneels at the head of the patient, and, reaching forward, grasps the arms near the elbows, carries them up in an extended position. This maneuver creates a vacuum in the lungs, allowing air to enter; the arms are held in this position for two seconds, then carried downward and pressed firmly against the sides, forcing air from the lungs by compression. This to and fro movement is kept up at the rate of fourteen to fifteen per minute, until there is a return of natural breathing, usually shown by a voluntary gasp on the part of the patient. This is the most reliable of all methods of restoring suspended animation, caused by inhaling carbonic dioxide; air must be gotten into the lungs, either by force or natural act of breathing. Otherwise the case is hopeless. This is true for physiological reasons, which can not be discussed here; suffice it to say that under normal conditions oxygen freely enters the blood by way of the lungs, and its presence there is essential to life. As soon, therefore, as the breathing becomes regular, the inhalation of oxygen gas may be begun and continued until the livid color of the skin becomes less marked and consciousness returns. In the absence of the oxygen gas, stimulants are next to be thought of, as soon as there is ability to swallow. Whisky or aromatic spirits of ammonia are choice. Ammonia has the property of quicker action, but less durable than that of alcohol. Sniffing the fumes of ammonia is also useful. When patients begin to revive there is apt to be cramping of the limbs, or general convulsions. This requires no treatment beyond protecting them from injuring themselves by the convulsive movements. The cases need watching for some hours, for it may happen that those who are apparently out of danger will suffer a relapse and become again unconscious and die if left to themselves. The lifting and carrying of the injured is apt to be awkwardly done by men inexperienced in such service. Many injuries are of such a nature that misapplied force will further complicate the lesions which already exist, if indeed it does not lead to irreparable damage. A simple fracture of the leg may be converted into a compound one by injudicious handling. An unnecessary laceration of tissue is produced and consequent suffering, besides adding to the gravity of the case. This is but one of the many things which may happen to the disadvantage of the patient during transportation. To lift an injured person properly requires three bearers. Two should stand upon opposite sides in a position to support the upper part of the body; the third where he can conveniently take care of the lower extremities. Then, with the patient upon his back, all drop upon one knee, the two principal bearers, pushing their arms under the back, lock hands firmly together. The third pushes both arms under the limbs. At a given signal all arise to their feet. The weight is thus so evenly distributed as to be easily borne, and there is no appreciable jar or sudden twisting of injured parts.

A litter devised by the writer is adapted for underground work and insures safety in whatever position it may be placed. By its use in mining accidents the difficult problem of getting those severely injured to the surface, without discomfort or danger, is satisfactorily solved. The litter, with its burden, may be put upon a cage or in a bucket, and, when fastened in appropriate position, can be brought up without disturbing the position of the patient. To the litter a rope is attached to one end, and a guy line to the other, the latter being used to steady it during transit. When the upright position can not be maintained—owing to syncope, from loss of blood—a semi-horizontal or even reverse position may be chosen for the time being, in order to allow the remaining blood to gravitate towards the heart and brain, an expedient that is sometimes useful in extreme cases. The fastenings are so arranged that the position of the patient is not changed with reference to the litter while executing the different movements of hoisting or transporting through narrow passages, thus affording additional security and dispensing with an extra number of bearers. In practice this plan is proven an excellent one. The litter is inexpensive and durable; after being brought up to the surface, the injured are given over to the care of a physician, or placed in an ambulance for conveyance to the hos-

pital, and the duties pertaining to the first aid are practically ended.

In rendering first aid to the injured simple methods are to be preferred; they are always available and, moreover, within the comprehension of anyone possessed of ordinary intelligence, and can by them be easily put in practice at the time and place most urgently demanded.

Officious and meddlesome interference is to be avoided. It is never necessary and may do harm. There are certain definite things to be done in sudden emergencies. Common sense and prudence should indicate the course to pursue in every instance. The rule to do no harm is a good one and should be kept in mind at all times. Its observance is never a cause of regret, but, on the contrary, an evidence of a true desire to keep within the limits of safety—a most commendable qualification in the non-professional when called upon to take an active part in the care of the injured.

The Value of Topographic Maps.*

The value of topographic maps to the geologist, to the engineering fraternity, and to those interested in the general development of a region, is already established.

The topographic work of the Geological Survey may be divided into three classes:

First—the exploration work, which is primitive in the extreme and depends upon rough sketches and notes made while traveling between points distant one from the other, and the compilation of this data.

Second—The standard sheets, which are the product of the actual survey of an area in which the numerical values are completed—the measurement of horizontal distances and the elevations computed.

Third—The “special” maps of areas important to mining men, where development is in progress or to be begun.

The first of these is of more importance to the prospector—often is the only guide he has in a new region. They are small in scale and usually cover the forest reserves and such regions as Alaska.

The second and third are directly of use to the mining man.

The standard sheets are made at a scale, usually, of 1 inch to 2 miles, with contour lines 100, 50 or 25 feet apart, as determined by the ruggedness of the region under survey, which show the relief, the slope and height of the hills and mountains, and the grade of streams and configuration of the valleys. Cities, towns, roads, trails and isolated houses outside of towns, and the township corners and lines exactly as found, are shown. These sheets are the size of a small newspaper page, and include an area of about 400 square miles each.

The “special” maps show everything enumerated for the standard maps, and, in addition, the buildings, street railways and alleys in the towns, the section corners, “quarter” corners, all mines and the important prospect holes. The interval between the contour line ranges between 10 and 50 feet, and the scale between 800 and 2000 feet to the inch.

The field work of topographic mapping is of three varieties:—

First—The primary control, which consists of a few carefully computed points—which are located by triangulation.

Second—The spirit leveling, upon which depend all the measurements of heights and contouring; and

Third—The drawing, in the field, of the map upon this data, for which the plane table and telescopic alidade in connection with a telemeter rod is used.

The standard sheets are of such accuracy that with a little experience the mining man can locate his property upon the map with reference to its elevation above sea, its distance from mountain peaks, streams or towns. He can determine approximately the length of a trail or road to his property, together with the necessary grades; the location of a mill or smelter site, the head works and length of ditch necessary to bring him water, and the feasibility of constructing a railroad connection should the development of the property warrant it.

The “special” maps may be used to better advantage for all of these purposes, but as they necessarily cover a smaller area, the relationship of the information to distant points cannot be so well determined.

Upon these maps the mining claims may be plotted, or measurements made from definitely marked points on the map to croppings or other geological features, and so the surface position may be determined.

The standard sheets have been completed of an area of many thousands of square miles, and many special maps have been published. Of the latter I might mention the following: Aspen, Leadville and Telluride in Colorado; Marysville and Nevada City in California; Globe, Clifton and Bisbee in Arizona; Butte, Marysville and Elkhorn in Montana, and many more.

These maps of the survey are engraved, printed in three colors—brown expressing relief, blue the water and black the artificial features, roads, houses, etc. This helps one to an intelligent and rapid reading of the map.

In Montana there are about twenty sheets com-

pleted; but many of these are an intermediate grade between those of exploration and the standard. These are one inch to four inch scale, with a contour interval of 200 feet. This work is no longer done. There are on the table a number of maps of the adjacent region and of the various portions of Montana, which I hope those interested will inspect.

Comparative Cost of Air Compression.

In a paper read by W. Thompson, Rossland, B. C., at the Nelson meeting of the Canadian Mining Institute, Nelson, on the 10th inst., the author gives comparative costs of compressing air with steam and electricity at Rossland. In the paper Mr. Thompson says that the question of the selection of power supply to be made by mine managers at Rossland is almost entirely removed from chance, and may be based on ascertained facts. Railways being at hand for the transportation of any kind of machinery, reasonably cheap fuel in quantities required is assured, and electric power for any size machinery or service is available. Therefore the problem simply resolves itself into: Which of these powers will give the best service in operating the machinery used in connection with mining operations?

The steam plant was erected for the Le Roi M. Co., Ltd., and consisted of two 250 H. P. water tube boilers, arranged to burn coal as fuel, intended to generate steam to run the air compressors, and set so as to work, if desirable, in connection with nine 125 H. P. steel shell return tubular boilers, designed to operate the hoisting and surface plants, these boilers arranged to be interchangeable to either service. During the test the water tube boilers were used at a gauge pressure of 150 pounds per square inch, using Crows Nest coal as fuel, which cost, delivered, \$5.55 per ton of 2000 pounds. The steam driven air compressor plant consisted of two compound condensing Corliss valve engines, direct connected to two-stage air cylinders, equipped with intermediate cooling devices, each machine having a rated capacity of 4000 cubic feet of free air per minute, or a combined capacity of 8000 cubic feet of free air per minute at sea level. A more detailed description of these engines would be as follows:

	No. 1 Engine.	No. 2 Engine.
INCHES.	INCHES.	INCHES.
Diameter high pressure steam cylinder.....	22	22
Diameter low pressure steam cylinder.....	36	36
Diameter high pressure air cylinder.....	22	22
Diameter low pressure air cylinder.....	36	38
Length of stroke.....	48	48

Intercoolers, horizontal multitubular type; condensers, independent jet.

The electrically driven air compressing plant was erected by the Rossland Great Western Mines, Ltd., originally intended to be operated in connection with the steam plant described, to supply power from a central station to four mines, owned by different companies. This arrangement would have given each mine power at the lowest possible cost, and have ensured continuous operations by reason of the compressing plant being arranged in separate units. Each company would pay its share of operation—maintenance of plant—pro rata to its consumption of air. When it was found necessary to erect the third unit to the compressing plant, difficulties presented themselves in the shape of shortage of water for condensing and cooling purposes. On examination it was found that a satisfactory supply could not be secured without heavy capital expenditures for erection of flumes, etc., to convey the water to where it was required for use. It was, however, found that a supply of water, barely sufficient for the intercoolers and water jackets, was available $\frac{1}{2}$ mile distant from the steam plant. This supply was so located that it must either be pumped or else the plant located at this distance away from the main steam plant. By conserving this water supply—cooling and reusing—it was decided a sufficient supply of water for the air cylinder jackets and intercoolers could be secured. The results obtained from the steam plants had proven satisfactory. It was considered questionable if any electric plant could be installed that could successfully compete with steam, even when running non-condensing, unless very favorable rates for power could be secured. It was decided to erect an electrically driven plant, three-phase, synchronous motor, designed for 2200 volts, rated capacity 660 K.W., equivalent to about 825 H. P.; a 54-inch clutch set intermediate between the driving pulley and the motor, the latter of a four-bearing type, fitted with self-aligning and self-oiling sleeves; driving pulley 60 inches diameter, grooved for twenty-two $1\frac{1}{2}$ -inch ropes, 270 revolutions per minute.

All tests were conducted under the personal supervision of the writer, and extreme care was taken to arrive at actual facts. Indicator diagrams were taken off both the steam and air cylinders every half hour, and the results tabulated. Coal consumed was weighed, and all other supplies, such as waste, oil, etc., charged as used.

Readings were also taken and recorded, by means of a kilowatt meter connected to the primary mains,

of the amount of electric power used. The test extended over a period of thirty days, without interruption, both plants being run under exactly similar conditions as to air pressure.

Each of the plants tested, being modern and representative of their respective types, gave favorable opportunity for a comparative test. The average results of the thirty days' test are given as follows:

TABLE I.

WORK PERFORMED BY STEAM PLANT.	
Average indicated horse power at steam cylinders of the combined machines.....	730
Free air compressed per minute from atmospheric pressure to 95 pounds per square inch, cubic feet.....	5,432
Free air compressed per hour, cubic feet.....	325,920
Average horse power required at steam cylinders to compress 100 cubic feet of air per minute to gauge pressure.....	13.4
Pounds of coal consumed during test.....	1,038,000
Pounds of coal consumed per day of 24 hours...	36,400
Average pounds of coal consumed per horse power per hour during test.....	1.9

TABLE II.

WORK PERFORMED BY ELECTRIC PLANT.	
Average horse power registered at switchboard..	540
Free air compressed per minute from atmospheric pressure to 95 pounds gauge pressure.....	3,319
Free air compressed per hour.....	199,140
Average horse power required at motor to compress 100 cubic feet of free air per minute to 95 pounds gauge pressure.....	16.3

TABLE III.

COST OF OPERATING STEAM PLANT.	
Total cost fuel consumed during test.....	\$2,880.45
Total cost of wages for employees.....	710.00
Total cost of oils, waste, etc.....	147.30
Total cost for 30 days, exclusive of maintenance and depreciation.....	\$3,737.75
Cost per H. P. per month for fuel.....	3.96
Cost per H. P. per month for oil, etc.....	0.20
Cost per H. P. per month for wages.....	0.97
Cost per H. P. per annum.....	\$5.13
Cost for each 100,000 cubic feet of free air compressed.....	61.56
Cost per drill shift.....	1.25

NOTE.—Eighty thousand cubic feet taken as the average consumption per shift of one $3\frac{1}{2}$ -inch drill.

TABLE IV.

COST OF OPERATING ELECTRIC PLANT.	
Cost of current for 30 days.....	\$1,744.26
Cost of employees' wages.....	270.00
Cost of oils, waste, etc.....	73.00
Total cost for 30 days, exclusive of maintenance and depreciation.....	\$2,087.86
Average cost per H. P. per month.....	3.87
Average cost per H. P. per annum.....	46.44
Cost for each 100,000 cubic feet of air compressed.....	1.46
Cost per drill shift.....	1.17

NOTE.—Eighty thousand cubic feet taken as the average consumption per shift of one $3\frac{1}{2}$ -inch drill.

RESUME.

SHOWING COMPARATIVE RESULTS BETWEEN THE TWO TYPES OF COMPRESSORS, BASED ON EACH 100,000 CUBIC FEET OF AIR COMPRESSED FROM ATMOSPHERIC PRESSURE TO 95 POUNDS RECEIVER PRESSURE.

Cost for each 100,000 cubic feet of free air compressed by steam plant (see Table III).....\$1.56
Cost for each 100,000 cubic feet of free air compressed by electric plant (see Table IV).....\$1.46

The saving shown in the resume would be affected adversely if the electric plant was operated singly and the entire air compressed was not used, for the reason that electrically driven compressors must be operated at constant speed, and loss of air at safety valve would be considerably increased over the same loss at steam plant, which could be run at the speed required to compress the amount of air actually required. This loss would, however, be slightly offset by the increased cost per horse power by working the steam compressors on underload.

The results of a number of tests made on the efficiency of the intercooler are shown as follows:

Temperature of cooling water at inlet of intercooler.....	42°F
Temperature of cooling water at outlet of intercooler.....	50°F
Rise in temperature of cooling water while passing through intercooler.....	8°F
Temperature of air at outlet of low pressure cylinder and before passing through intercooler.....	196°F
Temperature of air at inlet of high pressure cylinder after passing through intercooler.....	54°F
Reduction in temperature of air after passing through intercooler.....	142°F

PLATINUM ANODES are attacked more readily in concentrated than in dilute hydrochloric acid. In an acid of given strength the attack diminishes as the current density increases. This is explained by the diminution of the concentration of the acid in contact with the anodes which is produced by the current, the diminution being greater with high current density. Platinum-iridium is less liable to attack than platinum.

*A paper read by R. M. CHAPMAN at the Butte, Mont., session of the Mining Congress, Sept. 3, 1902. Specially reported for the MINING AND SCIENTIFIC PRESS.

Mining and Metallurgical Patents.

Patents Issued September 2, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

UTILIZING WASTE HEAT IN CONNECTION WITH SMELTING FURNACES.—No. 708,018; R. Brown, Southampton, England.

Apparatus for utilizing waste heat in connection with smelting furnaces, comprising covered chamber to receive materials for furnace, having floor supported so as to form flues to receive hogies containing hot products from furnace, floor having openings adapted to allow air heated by contact with hot products to ascend through materials thereon.

APPARATUS FOR EXTRACTING METALS FROM ORES.—No. 708,494; J. Randall, Deadwood, S. D.

In an apparatus for treating ores, series of tanks with outlets at bottom, series of agitators adapted to discharge contents into tops of tanks, means for conveying contents of each into agitator directly above adjacent tank for discharge into the latter, each tank having lip with discharge leading into ore receiving end of agitator, whereby ore and fluid pass through agitator in same direction, parts being combined as described.

IRON BLAST FURNACE.—No. 708,116; M. P. Boss, San Francisco, Cal.

In a blast furnace, waterjacketed fire chamber, air

blast tuyeres, C, extending through and supported at opposite aligned points in opposite walls of chamber, oil feeders passing through water-jacket of said chamber leading into tuyeres, and valved feeder pipes, H, below tuyeres, C, also extending through and supported at aligned points in opposite walls of water-jacket.

ZINC FURNACE.—No. 708,438; W. C. Wetherill, Joplin, Mo.

A zinc furnace, provided with series of relatively deep, long and narrow charge-containing chambers, separated by removable combustion flues, consisting of hollow tiles located one above the other extending entirely across chambers, supported at their ends upon partition walls, ends of tiles being joined by connecting passages beyond partition walls, luting material located in recess between top of one tile and base of another throughout series, whereby furnace may be charged and discharged without dismantling it, destructive effects of slag largely obviated and loss of zinc by absorption materially reduced.

MAGNETIC SEPARATOR.—No. 708,185; J. P. Wetherill, South Bethlehem, Pa.

A magnetic separator, consisting of upper and lower U-shaped magnets, whose poles are so arranged as to form magnetic circle with two gaps, outlying hoppers for supplying to gaps material to be separated, jet pipes whose jets are directed through gaps on opposite side to feed, endless belt carrying scraper blades having path of movement successively through gaps, laterally disposed hoppers to receive non-attracted particles, and end hopper to receive attracted particles as they are conveyed to it by the scraper.

INTERNAL COMBUSTION ENGINE.—No. 708,029; R. Diesel, Munich, Germany.

In an internal combustion engine, combination of working cylinder and piston, working cylinder having mechanically controlled inlet and valved outlet for air or combustible mixture; fuel feed valve and exhaust; source of supply connected to inlet for air or combustible mixture; compressing pump, having inlet and outlet; connection between inlet of compressing pump and mechanically controlled outlet of working cylinder, receiver interposed in connection between outlet of compressing pump and fuel feed valve of working cylinder; means for operating compressing pump.

PROCESS OF MAKING SODIUM CYANIDE.—No. 708,079; F. Roessler, Frankfurt, Germany.

Treating mixture of sodium cyanide and sodium

carbonate with insufficient water to dissolve cyanide completely, forming lye, separating lye from mixture, again treating remaining mixture with such quantity of water as is necessary to dissolve all cyanide left in mass after first treatment, forming second lye, lixiviating fresh quantity of mixture of sodium cyanide and sodium carbonate with second lye, whereby sodium carbonate in solution is displaced by sodium cyanide, depositing crystals of sodium cyanide by cooling, fusing crystals of sodium cyanide in their water of crystallization at about 33° C., whereby cyanide is separated in a free state from water.

Ore Roaster Decision.

"We will uphold the decree of the circuit court of Kansas in the case of the Lanyon Zinc Co. against Horace F. Brown et al."

These were the words of Judge Caldwell this morning in rendering a decision in a case involving the right to the use of a patent ore roaster. An oral decision was rendered, Judge Hallett sitting as associate justice.

To hear the case dismissed in a few words gave no impression of its magnitude and one not familiar with the issue would not imagine that millions hung in the balance.

The case dates back several years to when Brown obtained letters patent on an improved ore roasting furnace. Later the Lanyon Zinc Co. used and manufactured an ore furnace of similar construction. The latter company conceded the furnace to be of a similar nature to Brown's, but claimed that it was superior in many respects and was not an infringement on his patent. In the original suit Brown asked for a restraining order and \$850,000 damages.

Judge William C. Hook of the circuit court of Kansas rendered a decision favorable to Brown. It was adjudged by the Kansas court that the furnaces manufactured by the Lanyon Zinc Co. were constructed in substantial accordance with the letters patent held by Brown, and that it was done without license and authority and that by so doing the patentee's rights were infringed upon. The decree ordered the Lanyon Zinc Co. and the Pittsburgh Foundry & Machinery Co. to desist from further infringement.

The decree also ordered that the complainants were entitled to the recovery of the profits which had accrued to the defendants from the infringement by the manufacture, sale and use of the patent.

The decision of the circuit court of appeals was a surprise to Attorney John H. Atwood of Leavenworth, who was defending the Lanyon Zinc Co.

The accrued profits which Brown will receive from the defendants now amount to something more than \$1,000,000. The patent right is said to be worth \$500,000 a year.

It has been stated the case involves the steel trust and the Standard Oil Co. The Standard Oil Co. is said to be the chief owner of the Lanyon Zinc Co., which must now either close or pay a royalty of about \$500,000 a year for the privilege of using the Brown furnace, which it is averred is owned by the steel trust.—Denver, Colo., Dispatch, Sept. 7.

Oil Fuel for Ocean Steamships.

The report of Lieut. W. Winchell, U. S. N., detailed by the Navy Department to observe the installation and efficiency of the oil fuel system as fitted to the Oceanic Steamship Co.'s steamer Mariposa, states that the Mariposa's gross displacement was 3160 tons, her average was 354 knots, a mean speed of 13.58 knots, with 278 barrels of oil per day. This was 50% less in weight than would be required of coal, for one and one-half pounds of oil sufficed to produce a horse power. An advantage in the oil fuel was the reduction of the engine room force from thirty-six to twenty men. The ship used only twelve of her eighteen furnaces, burning crude oil in two burners in each furnace by means of an air compressor of a capacity of 1000 cubic feet per minute at thirty pounds pressure. All of the burners were not used, except at short intervals. The entire refuse after a run of 3434 miles from San Francisco to Tahiti barely filled two ash buckets; the flames did not affect the boilers unfavorably.

Difficulties experienced were confined to the choking of the strainer, which can be obviated by duplicating those parts and in the regulation of the supply of oil to the feeders. When the air compressor needed overhauling, in one or two instances, recourse was had to a steam spray, which wisely had been provided.

Lieut. Winchell says that while fewer men are needed in the fire-rooms with oil it is necessary to secure men of higher intelligence, with technical aptitude and nerve, closely to watch the furnaces. The essentials are that there should be a constant air pressure for atomizing; that provision shall be made to maintain regular temperature of the oil, and that the oil strainers be watched steadily.

He says that the Mariposa's trip was remarkable in many respects, and was a tribute to the skill of the Pacific mechanics and to the enterprise of the company which first installed the oil burners in lieu of coal.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS

ALASKA.

F. C. Helm of the Valdez. Copper River & Yukon Co. asserts that 35 miles of the Valdez-Eagle railway will be built this year, and that the entire 400 miles will be completed within two and one half years. He says that the contract for the building of the road has been let to J. P. McDonald of New York for completion in that time, and that rails for the road are on the water between Seattle and Valdez, to be distributed by September 20.

The Nazina gold diggings in the Copper River valley, 200 miles inland from Valdez, are reported rich. On Rex gulch, in three days, four men are said to have sluiced out \$1500 in one sluice box. This streak extends along the gulch. About 400 claims have been staked in the district. The remarkable feature of mining on the Nazina is the filling up of sluice boxes with native copper. Nuggets vary in size from a pinhead to 100 pounds in weight. The whole bedrock is covered with this copper along with the gold.

ARIZONA.

GRAHAM COUNTY.

The leaching process for the ores of the Lone Star district is reported a success. Manager Williams at the leacher, near Safford, has 500 tons ore taken out of the Horse Shoe mine, which has been thoroughly tested, averaging 5% copper with small values of gold and silver.

A trainload of copper passed over the A. & N. M. last week—the first regular freight train over the new extension from Lordsburg to Hachita, where connection is made with the El Paso & Southwestern. The Era says that fifteen cars of the copper ore came from Clifton and seven from Morenci, averaging thirty tons each—660 tons. At 10 cents per pound this shipment is worth \$132,000.

C. P. Rosecrans, manager Standard copper mines, says that 125 tons ore were shipped from the mines last week to the A. C. Co. for treatment, and on September 1st forty-five tons more were shipped. The ore averages 20%.

H. Firth has charge of the property of the Aravaipa M. Co.—nineteen silver claims.

W. B. Thompson, president, and H. S. Anderson, treasurer, of the Coronado M. Co., are at Clifton to put men to work developing the property.

MARICOPA COUNTY.

The Eddy G., S. & C. M. Co. has claims in the White Tank mountains, 30 miles west of Phoenix, that will be developed by Eddy & Donofrio of Phoenix.

Near Wickenburg, the White Gold M. Co. has six claims, most of the work being done on the Right Bower claim. Three tunnels have been run, the longest 125 feet. The ore carries \$18 gold, silver values extra. About 700 feet of work has been done on the property and three shifts will be started next month, running the tunnel through the mountain, giving a depth of about 700 feet. Water in the river at the mouth of the tunnel furnishes an abundant supply for a 100-stamp mill. It is the intention of the company to erect a mill. B. F. Porter is general superintendent.

MOJAVE COUNTY.

Kingman expects the Schuykill mine to start up soon. Manager O'Neill will sink to a depth of 1000 feet and carry on exploration from that point.

Salt Lake men have located several thousand acres of placer land near the old Senator mill and a number of quartz claims that show width and values in the outcrop.

The Minnesota mine has an ore body on the 400-foot level that, shipped direct to the smelter, averages in carload lots 320 ounces silver and 2½ ounces gold to the ton.

The Oro Plata mine has been unwatered and miners are crosscutting to the foot-wall vein.

The Homestake mine below Kingman is to be equipped with a reduction plant.

The new machinery for the Nighthawk mine is on the summit above the mine, ready to be skidded to the tunnel where it is to be installed.

A tri-weekly stage line has been put on between Needles and the Boundary Cone camps, sixteen miles.

PIMA COUNTY.

Tucson reports a movement toward construction of a new railroad through the mining section of southern Arizona and the erection of a custom smelter at Tucson. When copper went down, many of the mines situated at a distance from the Southern Pacific Railroad could not afford

to haul their ore to Tucson and then ship it by rail to El Paso. With prospects for both a railroad and a smelter at Tucson, the mine owners would resume development work.

H. E. Cook, a representative of Boston men, has completed inspection of the route of the proposed America-Mexican Pacific Railroad, and has returned to Boston to recommend that they take the bonds of the railroad. W. W. Robinson, representing San Francisco men is making contracts with the mine owners for ore, which they guarantee to deliver at a custom smelter, which Mr. Robinson will erect at Tucson. Those contracts guarantee nearly 1000 tons of ore daily.

J. P. Owen, manager Sierreta M. & M. Co., operating the Banner mines in the Sierretas, has returned to Tucson from New York, accompanied by G. B. Lindeman, president of the company, S. D. Kynor, secretary, and J. H. Davis, a director. They will visit the mine to determine the advisability of erecting a mill. The Post hears that Manager Owen is engineering a deal to secure control of the mines at Oro Blanco.

The Ronquai M. Co. is organized in Boston to work the Loma Verde mines, in the Rincon mountains; incorporators are all women.

YAVAPAI COUNTY.

The Prospect says the Val Verde smelter had trouble and shut down on account of floods in the Agua Fria river, from which it gets its water, but is again running all right. The copper supply is coming chiefly from the Butternut mine, owned by the Butternut Gold & Copper M. Co.; they are also getting shipments of siliceous copper ore from the Cornucopia mine.

The Bretherton hot blast is giving satisfaction; it enables them to get along with about one-third the usual coke and dispenses with roasting.

The machinery for the concentrating plant of the Standard S. & R. Co. is on the ground at Val Verde ready to be put in place; minimum capacity of plant, eighty tons a day. A 10-stamp mill to handle the free milling ore will be run in connection.

The new mill of the Oriental M. Co., Big Bug, is on ore from the Postmaster mine.

The second hole of the Hercules M. Co. is down 510 feet. The last 5 feet have been in breccia formation. H. E. Armistage is using a diamond drill.

The Iron King mine, at Big Bug, has put in a steam hoist. Manager Blanchard projects a 10-stamp mill and a 50-ton cyanide plant.

The Cash mill, near Prescott, is daily turning out five tons of concentrates.—A. Ratcliff is taking out rich ore from the Queen mine, 12 miles west of Prescott.—The 40-ton ore reduction plant of the Oriental M. Co. is completed and running steadily on a good grade of ore.—The Hassayampa Gold Dredging Co. expects to operate on the gold-bearing beds of the Hassayampa, near Walnut Grove. Experts have tested the gravel and as high as 50 cents in gold dust has been obtained from three pans.—The Iron King group, near Mayer, is to have a 10 stamp mill and a 50-ton per day cyanide plant.—The Lion G. M. Co., Cherry Creek, has machine drills sinking the shaft, which is now down 400 feet. The shaft will be put down 500 feet before any drifting is done.

On the United Verde mine present conditions the master mechanic, Adamson, of the Copper Queen Co., Bisbee, Cochise county, says: "It is hard to say how the management of the United Verde will succeed in flooding the mine to the extent of extinguishing the fire. The only supply of water that would be adequate is in the Verde river, which is 7 miles distant. To raise the water to the height required would require at least two stations of pumps of immense horse power. This would probably prove sufficient to lift the water, as Jerome is 5500 feet high. But when the water is raised there, have we any assurance that this will extinguish the fire? It is known to everyone who has been to Jerome that the mountain is split in every direction, which would permit the water to run off indefinitely. The question arises then, can these clefts leading away from the mine be sufficiently bulkheaded?"

"Granting they sufficiently close the mine or bulkhead it, so called, will that extinguish the fire? The level upon which the fire first broke out was closed tight for nine months, when a stream of water continually poured in upon the fire. It was thought that would be sufficient, but that level was not opened again three weeks before the fire broke out as strong as ever. The problem of extinguishing a fire in a mine is one that is not solved thus far, when it assumes proportions like that of the United Verde. The Anaconda mine at Butte has been on fire for the past

twenty-two years and they have never succeeded in putting it out.

"The effects of the shut down of this mine is hard to estimate, for it is not confined to Jerome or the United Verde alone. With the great growth of the United Verde the surrounding country has in a large degree depended. There are 2000 men on the pay roll at Jerome who depend upon the United Verde for a livelihood. Many of them have homes there which they have built. They will, of course, be thrown out of employment. The town is about 4000 in population which, of course, must depend upon the miners, and when the miners go they must go, for what is there for them after the mine ceases to operate? Jerome Junction, employing fifty or more men to transfer the copper which is shipped out of the mine to other railroads, will certainly have no further use for the men and the support of this town is suddenly withdrawn. There is quite an extensive farming population in the Verde valley, who depend very largely upon the Jerome market. These will have to find other markets for their products. Prescott received a great revenue from that mine, directly and indirectly, which will be taken, and it must be remembered that owing to recent fires people of Prescott and Jerome are both heavily in debt.

"The railroads will certainly be affected, for the engines running from Jerome Junction to Jerome hauled twenty trains daily. It is easy to see where this traffic would be minus and where railroads would be affected by it and where these crews would be out. This would affect the traffic from that point to New York. These trains are used to carry ore and passengers out and coal supplies and passengers in.

"The mines are supplied with coal from the Clarksville mines near Gallup, N. M., a mine owned by W. A. Clark and operated to supply the mine at Jerome. This will be very materially affected if it should no longer be operated to supply the United Verde, for it is situated too far back from the railroad for advantage. There are several hundred men employed in these coal mines."

YUMA COUNTY.

J. W. Bursen, of the Socorro mine, has a shaft 370 feet deep, with 6 feet sulphide ore on the bottom, average value, \$22 per ton gold. He expects to have a 20-stamp mill in operation next month.

CALIFORNIA.

AMADOR COUNTY.

Near Pine Grove, the Mitchell mine has closed. Superintendent Hyner expects to arrange with the owners for further sinking.

At the Zella heavy square timbers and other lumber are being hauled to this mine, preparatory to retimbering the shaft 400 feet.

The Standard Electric Co. is moving all the machinery from Bear river to Blue lakes. When all the dams are finished the company will have a large body of water in reserve for dry seasons. About 240 men are working on the different dams.

CALAVERAS COUNTY.

The Sierra railway will begin running regular freight and passenger trains into Angels on the 15th.

A. P. Morris of the Black Cat O. & M. Co. has bought the Occident-Keystone property. H. E. Branthaver, J. E. Seroy and W. T. Robinson are in the purchase. The price paid was \$68,000. The Occident-Keystone is an extension of the Old Boston, or Esperanza mine. The sale includes mill site and timber land. Two tunnels are in pay ore and water and electric power are on the property. Arrangements are making for an increased number of stamps, power drill, compressor and cyaniding plant. W. T. Robinson will superintend operations at the mine.

COLUSA COUNTY.

The dispatch in the dailies from Willows about finding gold in the town, in ground where a cellar was being dug for Legg & Shaw, contained some mistakes which should be corrected. First, there is no two-story brick building being constructed in that town; second, there is no Legg & Shaw Co.; third, there is no Main street in Willows, and, lastly, there has been no gold found. Deducting these errors, the dispatch was all right.

EL DORADO COUNTY.

The El Dorado W. & D. G. M. Co. will reopen its gravel mine at Texas Hill. F. Goyan will be in charge.

KERN COUNTY.

The Randsburg Miner says last week's milling of ore from the Butte Lode Co. of eighty-nine tons returned three bars of bullion worth approximately \$5900. The production of this mine for the first eight months of 1902 is more than \$12,000 ahead of the corresponding months of 1901.

MARIPOSA COUNTY.

(Special Correspondence.)—The Whitlock district is having many of its mines placed beyond the prospecting stage by systematic development. The ores are free milling and high grade. At Ellingham's mill the owner is replacing wood with fuel oil, being the pioneer oil burner in this district; several other properties are only awaiting a successful trial before changing. The ore bins of the Austin mill are being filled, and the stamps will soon be dropping there. Work is being pushed ahead on the Hayseed mine. This property is showing up well; formation diabase and greenstone. A new steam hoist is installed and the shaft house improved. The incline shaft (45) is down 300 feet, and a rich pay shoot is being opened up on the third level. They are working three eight-hour shifts. Ore is free milling. At the Teabo mine they struck another rich shoot, and double shifts were put on. Work is progressing on the Helm, Regan and Golden Gate properties. A new impetus will be given to the camp when the electric power plant on the Merced river is completed, as with cheaper power the large low-grade bodies of the Whitlock, Bulldog, Geary and others will then be capable of being milled at a profit.

Whitlock, Sept. 8.

The Mary Harrison 40-stamp mill at Centerville has closed down after eight months continuously successful operation.

MONO COUNTY.

The Sweetwater mine, Silverado canyon, J. A. Brown general manager, A. Sayres superintendent, has finished a 10-stamp mill and 50-ton cyanide plant. A. K. Wilson has charge of the cyaniding.

NEVADA COUNTY.

The Home G. M. Co. has elected D. J. McFall superintendent. The 30-stamp mill is in constant operation.

At the Orleans is being driven an upraise to connect with the old Heuston workings, about 210 feet. Superintendent C. A. Brockington estimates it will be completed Nov. 1.

J. E. Carter has organized a company to operate the South Idaho and expects that next month machinery will be in place and work begun. Grass Valley men believe that the extension of the Eureka-Idaho-Maryland ledge is in that mine.

The Champion Mines Co. is incorporated at Grass Valley: M. Sondheimer, J. Fetz, J. Bernhard, E. Schuck, H. Heinsohn, J. Assion, San Francisco; A. Wilhelm, Alameda. The company owns the Champion mine and adjoining mining properties.

At Grass Valley the Brunswick, C. H. Mallon superintendent, employs twenty-seven men. The Union says sinking has been in progress for the last nine months; the shaft is now down 1250 feet. In the east drift, which is in 506 feet, there is a 3-foot ledge; the greater part of the ore is low grade. It is estimated that by driving this drift 125 feet farther the main vein will be encountered. The west drift has been run 425 feet, with satisfactory results.

At the Grass Valley Con. mine it is expected that the present mill will be enlarged from ten to twenty stamps, a slime plant put in, and the shaft enlarged to three compartments when sunk to a depth of 1000 feet. A 40 H. P. electric motor runs the mill, concentrators and rock breaker; a 96 H. P. motor supplies power for the compressor, hoist and pump. G. W. Root has twenty men on the payroll.

The stockholders of the Jenny Lind M. Co. have elected the following directors: C. Stocks, J. W. Brown, W. M. Treloar, E. K. Smart, J. E. Polingdestro, G. Mainhart.

The Union reports that the 20-stamp mill at the Allison Ranch mine will be ready about December 1. The main building is 80x46 feet, 56 feet high. On the west side is a 20-foot sulphurets room. Under the ore bin is a rock wall 50 feet long, 13 feet high and 4 feet thick at the base.

Men are at work on the old Merrimac mine, near Town Talk, rebuilding the old shaft and retimbering the property to the drain tunnel. J. T. Gribble, superintendent Merrimac, is in charge.

The Union says the Pennsylvania will soon be working as many men as when work was suspended two years ago by litigation. Twelve additional men are put on. Ore is being taken out of the 700 level. The shaft will be sunk to a depth of 900 feet.

ORANGE COUNTY.

J. A. Comer, manager Santa Ana Tin M. Co., Santa Ana mountains, tells the Los Angeles Mining Review that he has tin in just such a formation as exists in one of the producing tin mines of Cornwall, England. The area over which it extends is about one-half mile long and 300 feet wide.

PLACER COUNTY.

At the Tadpole Con. M. Co. they are developing near Secret House. The main tunnel to tap the ancient channel is in 260 feet; an upraise is being made to strike gravel. The body of quartz is now 70 feet in width and prospects in free gold.

PLUMAS COUNTY.

Quincy reports a \$1000 nugget of gold brought there from Johnsville by W. Pastetta, found below Jamison City.

At La Porte the Clay Bank is in 7000 feet; and is still running for the back channel.

West of Little Grass Valley there are several claims on Moore's creek being prospected with a show of becoming good paying claims when properly opened.

SAN DIEGO COUNTY.

There are fifteen men working in the High Peak and Helvetia mines, taking out daily fifteen tons of milling ore, which keeps the mill busy.

A body of high-grade ore is struck in the Eureka mine, one of the Noble group in Pine valley.

On the Honeycutt group of mines on the Vicetos, near Poway, a body of ore has been discovered which assays \$9 per ton.

SANTA BARBARA COUNTY.

The failure of a deep well at Summerland to penetrate a stratum of oil supposed to lie from 1500 to 2000 feet below the surface of the ocean has proved a disappointment to that oil town. The attempt to drill into this deep stratum was made by H. Muller, an oil operator; his well has been abandoned at a depth of over 1200 feet. A string of tools, some cable and a fishing machine are now at the bottom of the well and the casing has been perforated at one of the shallow oil strata where a flow of from seven to ten barrels per day is ordinarily obtained. The depth is considered phenomenal in consideration of the fact that the well was started with a casing only 7½ inches in diameter and ended with only a 4½ casing. Oil drillers predicted when the well was started that from 500 to 600 would be its limit. The breaking of a cable caused the destruction of the hole. It is stated that the casing is not half an inch out of plumb throughout its length. The indications at 1200 feet are said to have been favorable. Men watched the drilling carefully and the formation through which the drill ran is said to have been distinctly a deep oil formation. Others will doubtless be tempted by the showing in the Muller well to drill to a greater depth. This well was the first to be run into deep ground at Summerland and is the deepest well anywhere near the Summerland dip.

SHASTA COUNTY.

Superintendent T. H. Russell says on Oct. 1st 300 men will be employed on the plant of the McCloud River Electrical Power Co. on McCloud river.

H. H. Noble of the Southern California Power Co. says he will establish a plant on Pit river with a capacity of 500,000 H. P. for the transmission of power to San Francisco. Four thousand cubic feet of water a second is to be conveyed 28 miles, giving a fall of 1300 feet on the power-creating wheels. Noble says his company has money to put in a big plant.

Near Copper City the Arps group is to be taken by the Empress C. & S. Co., F. H. Hall assigning his option on the mining property to that company. The property was taken under bond by Mr. Mr. Hall December 10, 1901, for \$80,000. The terms of the option provided for a certain amount of development work, for the payment of \$40,000 before December 10, 1902, and for the payment of an equal sum before June 10, 1903. Mr. Hall has complied with the working requirements and now transfers his option to the Empress Co.

The Modoc Chief Quicksilver M. Co. are examining the Clover Creek quicksilver mine, the title to which is vested in the Clover Creek Cinnabar M. Co. Some samples of cinnabar have been exhibited in Redding. Should the report justify it, the property will be worked.

An electrical power plant is being built by the owners of the Gladstone mine on Crystal creek, 3 miles above Tower House.

SIERRA COUNTY.

San Francisco and Oakland men will open up the mine of W. H. Weldon, near Forest City. A double shift will be worked on the second tunnel during the winter to tap the ledge at the 400 level.

G. A. Reynolds of Alameda will open up the True Fissure mine, near Gold Lake. A tunnel will be run to tap the ledge.

The Bellevue tunnel has been run since July, 1901, and is now in 3200 feet; an 8x8 tunnel, all the way hard rock; 200 feet yet to strike bordings, started in Wallace creek; a straight level, working two machine drills, hauling cars with a mule; power from a steam boiler, blower, electric lights and telephone into the tunnel as they proceed. So far little water to

bother the workings. The buildings are from the old Thistle shaft, on top of the hill, where they worked for several years by hoisting the earth and pumping the water. It was rich, but water got the best of them, hence their new location of a drain tunnel. In a few months more they will be in gravel.

At the Wild Boar a tunnel has been in operation for many years. Starting in at Gibson creek for the back channel, last July they struck soft rock, then went into pipe clay and a stratum of blue sand. They are now in 3525 feet. This should open up the ridge between South Feather river and Slate creek from Pilot Peak to the Clay Bank at La Porte.

SISKIYOU COUNTY.

The Golden Seal M. Co., Tacoma, Wash., J. B. Champlain general manager, has bought the Golden Seal claim near Oro Fino from Pitz Bros. and proposes placing a complete milling plant. The dredger at Hawkinsville has resumed operations.

The Rusby mine, Deadwood, is employing fourteen men. New hoisting machinery is to be added soon with the intention of sinking deeper.

Manager McLane, the Schroder mine, is employing twenty-six men, the 10-stamp mill operating.

The McVey copper property, on Joe creek, a tributary of Elliott creek, is reported sold to Montana men. The copper deposit is lens-shaped, carrying sulphide ore.

The new 10-stamp mill on the Wabana mine, 1½ mile west of Henley, owned and operated by Bennett, Reynolds & Matern, is about finished. The commercial business is done at Hornbrook, their post-office. They have a telephone line to the mine.

The Yuba Journal learns that the mines recently bought by E. D. Baker from Whip & Lowd, between Cherry Creek and Greenhorn, have been sold to G. V. Gray of San Francisco, who has men at work.

TRINITY COUNTY.

The Fairview mine, 8 miles from Lewiston, was recently bought for \$60,000 by Allenberg, Fontana and Jos. Porter, who is manager of the property. Setting the machinery in the mill is in progress; the tramway, which will carry the ore from the mine down the mountain to the mill, will soon be built. The flume will carry sufficient water from Papoose creek to the mill to furnish power. Seventy men are on the payroll.

L. Flynn of Lewiston has a lease on the Chamberlain mine from the Adele M. Co., and will reopen the property.

The Free Press says the Morrison Gulch mine, the property of Hilton & Webb of San Francisco and Seattle, has started up with twenty men at work and twenty more wanted.

There are eleven quartz mills of from five to ten stamps each on Coffee creek and the Trinity river, seven of them now running.—On the Dorleska mine McElwain & Osborne are employing forty men. Strode Bros. have fifteen men at work. C. Ruggles is working his mine and keeping a 5-stamp mill on Scorpion creek going. The Cook & Weiser 10 stamp mill is running steadily. Machinery is in Redding for a 10-stamp mill to be put upon the Three Peaks mine under the management of J. J. Chambers.

TUOLUMNE COUNTY.

S. Sprout, representing Wilber & Co., San Francisco, was in Tuolumne this week, examining a power plant project for his company. The proposition is to take water out of the main Tuolumne river, and convey it 10 miles through ditch and flume to Jacksonville, where it would get a fall of 450 feet; estimated cost, \$350,000.

A placer mine is being operated by Hess & Valverde, half way between Carters and Sonora.

Near Carters, the Hunter mine is bonded to J. P. Sweeney of San Francisco.

The Victory mine, 3 miles north of Confidence, will resume work. A 20-stamp mill is to be erected at the river and the ore will be conveyed by means of tramways. G. H. Lightfoot of San Francisco, one of the owners of the mine, is making arrangements.

YUBA COUNTY.

The California State Board of Examiners have approved the plans and specifications for the first of the proposed Yuba river barriers and at once notified the California Debris Commission of its act. The specifications approved are the same as were recently returned from Washington bearing the approval of the Secretary of War. Owing to the fact that the State and Federal Governments share equally the cost of this great undertaking, representatives of each must pass upon all important particulars. The first barrier will cost \$35,000, the total sum appropriated being \$800,000.

P. D. Whitehead of Chicago, F. C. Butterfield of San Francisco and F. E. Wright of North San Juan, have secured twenty-

eight mines and mineral locations in Yuba county and organized the Pacific M. Co. The claims are in Bullards Bar and Fosters Bar districts.

COLORADO.

BOULDER COUNTY.

Near Rowena the Gold Nugget Co., after two trial runs of 100 tons each at its mill, pending a sale to a New York party, declared the sale off, and mine and mill are closed down. The property was offered at \$150,000, one-third cash, the remainder on time payments. The intending purchaser was gratified with the trial runs, but made a counter proposition to pay \$100,000 spot cash in full for the property, which the Colorado owner, a practical mining operator, refused.

Work has been resumed on the group of the Rosalind M. & M. Co., on Hematite mountain, near Eldora. A crosscut tunnel, now in 490 feet, cuts the Anything and Rosalind veins, showing 14 feet of ore. On the Rosalind vein the values average \$7 per ton, while on the Anything there is 2 feet averaging \$16 and about 6 inches that runs above \$40.

From the Enterprise mine, on the north slope of Spencer mountain, about 1000 feet above Eldora, come reports of an ore body blocked out and ready for shipment. J. Phillips, one of the owners of the property, operating it under a lease, is shipping, receiving returns of \$35 per ton. Quantities of low-grade ore have been left in the stopes, which cannot be profitably treated by the smelters, but which could be treated by the chlorination mill. The shaft is down 400 feet.

CLEAR CREEK COUNTY.

A strike is reported in the Centennial mine, Georgetown, of a 4½-foot vein of copper-gold concentrating ore in the 600-foot or bottom level, averaging \$100 per ton.

The Georgetown Courier reports the main Kelly tunnel advanced 210 feet last month; 250 feet will probably be made during the present month. For several weeks this main tunnel has been making 8 to 10 feet a day, and about 6 feet a day is the average in the Deming vein in either drifting or crosscutting, as air drills are likewise employed there. A horse has split the Deming vein at a point in about 75 feet from the tunnel, one branch of the vein continuing with a 2-foot streak of mineral. An interesting feature of the progress made last month in the Kelly tunnel was the payment of \$750 which Manager Kelly had promised the miners, trammers and powder men for the extra development they might accomplish beyond 170 feet a month. As a result, the trammers who worked most steadily averaged from \$93 to \$101 a month and drill men \$4 60 a day.

Georgetown reports notification from the smelting trust to local ore buyers of an increase of \$3 per ton in smelting charges or treatment on all ores of a gross value of \$18 or under. The extra charge will have the effect of shutting off the sale of this class of ore. Very little ore of this grade is produced in that district.

CUSTER COUNTY.

Near Isle, Spaulding & Mooney, in the Custer City lode have ore carrying lead 65%, copper 22%, gold \$11.20, and five ounces of silver, 2½ miles south of the Terrible mine.

FREMONT COUNTY.

The Colorado Fuel & Iron Co. has surveyors working between Florence and Beaver creek, surveying a line for a ditch to extend from the steel works to Canyon City, where it will tap the Arkansas river, to secure water to run the steel works. The ditch will be 40 feet wide and 40 miles long.

GILPIN COUNTY.

The Register-Call reports that the Waltham mine is daily shipping three cords or about twenty-five tons to the Golden smelter. Besides the milling product which they are shipping to the Golden smelter, they are also shipping smelting ores, the shipments for the past month being five cars, one lot going at \$57 per ton.

Sinking operations are being carried on in the Saratoga shaft, now to a depth of 950 feet. Air drills are being used in putting down the cage shaft, three shifts being used. About 100 men are at work. E. R. Nelson, superintendent.

The Druid G. M. Co., E. McGinnis, superintendent, are developing the group of claims owned by the company in Russell district.

During the last week of August the shipment of smelting and crude ores, concentrates and tailings from the Black Hawk depot to the Golden and Denver smelters, as well as to Idaho Springs, were 104 cars or 2080 tons, making a total for the month of August of 409 cars, or 8180 tons, the same number of cars as the preceding month of July.

Sixty stamps are dropping at the mill

of the Boston & Denver Consolidated Co. at Black Hawk on custom ores.

LAKE COUNTY.

Leadville's August tonnage averaged 2100 tons—63,000 tons for the month—as large as August, 1901, except 5000 tons of manganese, which was then moving to the Chicago Steel Works.

During August the A. M. W. M. Co. shipped 3000 tons of crude ore, 1500 tons of zinc concentrates and 370 tons of lead concentrates. The Midas shipped 6105 tons, the Castle View lessees 475 tons, while the new A. Y. & Minnie mill made 650 tons of zinc concentrates and 445 tons of lead. The attempt to handle the zinc ore of the A. Y. & Minnie was a new experiment.

The Yak tunnel has maintained the average of production—100 tons per day. The tunnel is going ahead at the rate of 6 feet per day and is now in hard quartzite.

L. Atkinson has charge of the construction of the Resurrection mill. Manager Carnahan, when the mill is completed, will be ready to take out 650 tons of ore per day.

The Bimetallic plant of the American Smelting & Refining Co. has been dismantled this summer. All machinery, lumber and brick that was of any value have been taken to the Arkansas Valley plant, and the flue dust, slag and other material that promised to yield any value have been shipped away. There is not a vestige left of the old American plant.

SAN JUAN COUNTY.

Silverton states that the new process for saving gold values from the tellurium ores of Bear Creek camp is a success. The plant is a small one—one ton in twenty-four hours. It is working in the ores of the Good Hope. C. H. Gage is the inventor.

SAN MIGUEL COUNTY.

At Telluride the mill at the Silver Bell mine is still idle. Manager Buckley expects to begin Oct. 1.

The twenty stamps in the mill of the San Miguel M. Co., which have been dropping on ore from the Nettle mine, were hung up last week.

Telluride reports that L. White, on the Blue Lake lode, Bridal Veil basin, has a streak of ore carrying values in gold and silver to the amount of \$800 a ton. The property is owned by White, Adams & Hiltenshouse of Telluride.

SUMMIT COUNTY.

The Montezuma district has increased its ore output. The Colorado & Southern has put men on the line between Dillon and Keystone, the Montezuma and Rathbone shipping point, and will put the roadbed in condition. If the Montezuma and Argentine districts continue to improve, it is expected that the Colorado & Southern will extend its line to Montezuma.

Near Breckenridge, the Hamilton and Minnie are to reopen. The Minnie mine, on Mineral hill, is being put in shape by Foote & Whyte for development work.

At the Cashier mine, in Brown's gulch, Manager Wood has considerable low-grade ore, and will put the Cashier mill in shape to work it.

TELLER COUNTY.

The Vindicator Co. has started its new pump in the bottom level to handle the flow of water, that operations may be carried on in that level without further interruption. The new pump has a capacity of 500 gallons a minute, and that, with the one already working, permits them to throw 800 gallons a minute.

W. G. Rice, former general manager Stratton's Cripple Creek M. & D. Co., has organized a leasing company to operate in Cripple Creek.

C. C. Hemming has a 60-day option on the Morning Star claim, at the price of \$50,000.

Eight feet of smelting ore has been found in the 300-foot level of the Thompson shaft of the Elkton, which from all appearances had been covered up and hid from sight. That fact has been established because there were piled up on the ore body close to 200 tons of low-grade ore, rotten timber and mine rubbish. The find was made by J. Wright, who recently secured a lease on the property.

Cripple Creek reports a strike on the Mary Cashen property, adjoining the Gold Coin in the city of Victor. In the 425-foot level, in the crosscut 40 feet south of the shaft, an ore body that has been drifted upon or a distance of 25 feet returns values of \$170 to the ton.

The War Eagle Leasing Co., operating the War Eagle claims on Bull hill, is drifting now from the bottom of the winze; everything in sight is ore, averaging \$30 to the ton.

The mining men of the district feel good over the cut in freight rates on mining machinery from Chicago, Milwaukee and St. Louis and Mississippi river points. The cut means a considerable saving to

the compaoles that have machinery ordered. Formerly the rate from Chicago points to Colorado Springs was \$1.10 per 100 pounds; the second cut puts it down to 27 cents per 100 pounds.

IDAHO.

ADA COUNTY.

P. A. H. Franklin has been sampling the Daisy group of gold mines, 4 miles from Boise, and it is said that about \$100,000 will be paid for the property.

BOISE COUNTY.

Near Idaho City, a station is cut on the 400-foot level of the Washington mine. The distance from the shaft to the shoot is 125 feet. It will be tapped next month.

Fifty tons of ore from the Clover Leaf mine, formerly the Mountain Ram, crushed in the Lucky Boy mill, gave \$12 a ton. The mill has no concentrator, so the value in the sulphurets was not saved. This ore was taken out the full width of the ledge—a little over 6 feet, and milled without assorting. The shoot is 100 feet long. The old machinery on the dredger above Centerville has been replaced with new and the dredger is now in operation.

CUSTER COUNTY.

Reported discoveries at Loon Creek, east of Thunder Mountain, attracts the attention of mining men of southern Idaho. Some of the rock brought is covered with flakes of gold. Eddy and Beane have discovered what is said to be the Lost Packer lode, 12 feet wide and an average of nearly \$50 per ton. The mineral belt is 4 miles wide. Men are going into the new district from Thunder Mountain, Salmon City and Custer.

ELMORE COUNTY.

The Idaho-Richmond G. M. Co. is organized to develop a free-milling property on Rocky Bar, Bear creek; W. H. Stowell, M. E. Gallimore, J. W. Higgins of Spokane. The property has several strikers varying from 4 to 8 inches wide and carrying values \$200 to the ton.

KOOTENAI COUNTY.

Manager A. Klockmann of the Idaho-Continental M. Co., operating the Continental, near Port Hill, says he will build a railway to the mine next spring. At the same time a 500-ton concentrator will be built at the point where the tram connects with the railway. He says it is too late to go ahead with the construction of the road this season, but will repair the present wagon road at an expense of \$5000 and ship ore during the winter. About twenty-five men will be employed. The ore is a galena, running about 60% in lead.

SHOSHONE COUNTY.

(Special Correspondence).—The Gold Creek Con. M. Co. of New Jersey at Orofino, Pierce City mining district, are the owners of the Mascot. At present they have a 10-stamp mill and engines, also boilers large enough for twenty stamps. They have fifteen more stamps ordered. A 100 H. P. boiler is being taken into the mine, also compressor and hoist. Nearly 6000 feet tunnel work has been done in the mine. E. E. Rodgers is manager. Pierce City, Sept. 8.

Near Delta, the dredger on Beaver creek of the Northern G. M. Co. is in operation, the first of its kind in the county. It is the starting of a new branch of mining in the Cœur d'Alene section. The dredger cost \$40,000, is 75 feet long 35 feet wide, draws 4 feet of water. Manager C. S. Cryslar says it will take eight men to run it. Another dredger is being built for the Delta G. M. Co., which owns about 150 acres of land on Beaver creek, near Delta. Machinery for a third dredger has been ordered by the Beaver Creek G. M. Co. The entire upper end of the creek has been located as placer ground.

Murray reports 4 feet steel galena on Alder gulch. W. Q. Brown, manager Cœur d'Alene M. Co., secured the location on which the strike was made; property for miles around is being staked.

At Burke, the Headlight M. Co., adjoining the Mammoth mine, will resume. The 900-foot tunnel will be driven 100 feet, at which point it is expected the Mammoth-Standard ore vein will be tapped.

At Wallace, W. T. Hales says he has raised money from Pittsburg and West Virginia to operate the placer properties at the head of St. Joe river and of Cedar creek, 20 miles south of Iron Mountain station, Montana. It will require \$450,000 to operate both properties successfully. The Cedar property, 4 miles from St. Joe hasin, has made the best showing because it has been developed more extensively than the others. The St. Joe property is 8 miles long and from 800 feet to half a mile wide. The Cedar creek property is nearly as large. Sixteen men are employed on the Cedar creek property and the work of mining is being done by two plants. A mile flume has already been constructed. The St. Joe will be provided

with a mile and a half flume. From the tests made the ground yields about 85 cents in gold to the yard. The paystreak runs in depth from 20 to 100 feet before bedrock is reached. The principal work to be done this fall is to prepare for operations in the spring.

WASHINGTON COUNTY.

Manager F. E. Pierce of the Iron Dyke mine, Seven Devils district, says he has twenty-five men at work. He has let a contract for 75,000 feet fir timber in preference to other timber. The tunnel is now in 1000 feet.

The Fort Salver mine on Black lake, Idaho, Seven Devils district, has been worked for three years and 3000 feet of development work done in tunnels. The ore vein is 8 feet wide—\$20 to the ton. There are twenty stamps to the mill and the management is adding twenty more.

MICHIGAN.

HOUGHTON COUNTY.

At Houghton the Baltic during August furnished 231 pieces of mass copper, filling fifty-eight barrels. The largest block of mass copper ever found on the Baltic property was hoisted to the surface recently from No. 4 shaft, weighing 2570 tons. The total production for the month of mass and mineral copper was 380 tons.

MONTANA.

FEROUS COUNTY.

At Yazo work has begun with a large force of men in the new shaft at the mines of the Sapphire M. Co.

H. Parrent has rich ore on his Rawley claim, Dog creek section of the North Moccasin country. Reports give the ore a value of 300 ounces in silver, 20% lead and some gold. The discovery of lead-silver ore beyond the cyanide belt is regarded by mining men in that section as significant.

FLATHEAD COUNTY.

It is reported in Cabinet that J. Fredericks has a pocket of free gold quartz on the Libby claim from which he has taken two flour sacks full of the quartz. The claim lies between the Blacktail M. Co.'s property and the group of claims owned by the West Fisher G. M. Co., and is supposed to be an extension of the Gold Bug vein, which is owned by the American Kootenai M. Co.

GRANITE COUNTY.

(Special Correspondence).—The Mountain G. M. Co., with headquarters in Butte, are the owners of five claims near Princeton. This company commenced operations last March, and have sunk a shaft 100 feet and driven a tunnel 450 feet. They are treating the ore in their 10-ton mill, and shipping the high-grade ore to the smelter at Butte. The ore runs from \$10 to \$340 per ton. It is free-milling gold ore. They have a boiler capacity of 100 H. P. and employ twenty men. The property adjoins the Royal Gold mine, which has produced in the past about \$3,000,000. They intend increasing the capacity of the mill to fifty tons per day. The pay streak is from 6 inches to 3 feet wide. The country rock is granite. C. F. Chapin is the manager. Princeton, Sept. 5.

The Bear Mountain P. M. Co., J. D. Murphy, general manager, will work the Pine Ridge placer deposits, Cayuse gulch, 2 miles east of Garnet, where a deposit fills the basin at the head of the gulch and the ground slopes toward the gulch, the descent being sufficient to give the water used in flume or sluice boxes the proper fall. The deposit is composed principally of clay and gravel, stained by red oxide of iron, the whole resting on a bed of slate, free from large boulders. The property is developed by two bedrock drifts, one 1000 feet long, the other 600 feet.

The Pine Ridge claim comprises twenty acres of ground; the deposit has an average depth of 25 feet. Estimated cost, 3 to 5 cents to work the ground by the sluice-box and hydraulic method.

LEWIS AND CLARKE COUNTY.

The option for a bond held by the Montana M. Co. on the Strawberry and Mammoth claims on Skelly gulch has been taken up and the final papers executed. The properties are 16 miles from Helena. Five thousand dollars of gold ore has been shipped from the Strawberry shaft. The bond is for \$60,000, with provisions for the payment of royalties on ores milled or shipped.

W. Y. Simonton and associates are prospecting what may prove to be a body of gold ore amenable to the cyanide process. Nine claims have been located on the high benches and gulches on the north side of the Missouri river, above the mouth of Prickly Pear creek, 15 miles northeast of Helena.

MADISON COUNTY.

(Special Correspondence).—The Noble mine, 8 miles east of Sheridan, was started thirty-three years ago. It is ship-

ping ore that will run \$50 to the ton. They are driving an upraise for the old shaft. The shaft is 240 feet deep. The tunnel is 2090 feet long. The upraise is 700 feet long. R. W. Noble, Whitehall, is superintendent.

Whitehall, Sept. 8.

(Special Correspondence).—The Mountain View group of mines, owned by Johnson Bros. of Butte, is composed of five claims in Bear gulch, Tidal Wave district. They have sunk a shaft 260 feet on the vein and are running a crosscut tunnel and are in about 1100 feet and expect to cut the vein 150 feet farther in, which will give them a depth of about 900 feet on the vein. It is a sulphide copper ore, carrying gold and silver. The mine is 4 miles from the railroad at Iron Rod, on the Jefferson branch of the Northern Pacific. On the tunnel they have a boiler and compressor operating an air drill. They employ eleven men and are drilling about 8 feet per day. The ore averages about 12% copper, \$2 to \$3 in gold and a few ounces in silver. E. C. Baxter is the manager. Bear Gulch, Sept. 8.

(Special Correspondence).—The Bismark-Nugget Gulch Con. M. Co. of Sheridan are the owners of several claims in Nugget gulch, on Mill creek. The most important of these are the Diamond, Toledo No. 1 and No. 2, Diadem and Mountain Boy. This company has a 60-ton concentrator and 30-ton blast furnace smelter. In the claims mentioned they have galena and bodies of low-grade concentrating ore. The mine is $\frac{1}{2}$ mile from the concentrator. The Toledo shaft is down 300 feet and a crosscut run towards the Diadem 480 feet, and expect to tap the Diadem vein from the Toledo tunnel. This company expect to double the capacity of their mill and make many other improvements. A. B. Knight has charge of the work for the company. E. King has charge of the mine and F. B. Linderman the laboratory department.

The Iroquois M. & M. Co. of Sheridan have opened up some large bodies of fair grade ore. They have a small cyanide plant and stamp mill. O. F. Wright is manager. Sheridan, Sept. 8.

(Special Correspondence).—The General Shafter mine at Virginia City are operating a cyanide mill successfully on a fair grade ore. They have recently made a good strike in their property. The mine is under the management of Thomas Teal.

The Quincy mine at Twin Bridges, owned by Moffat Bros., Mason & Fox Bros., have crosscut an 80-foot copper ledge carrying good values in copper, 18 feet of which will run about 19%. The lead carries copper, gold and silver. Virginia City, Sept. 7.

Teal & Ribble of the General Shafter mine at Summit have a lease on the Fairview lode, near Pony. The Shafter mill will be run on ore from the Fairview. The miners at the Shafter will push development work on the Shafter and Keystone.

SILVER BOW COUNTY.

The Alice hoist will be rebuilt. General Manager W. T. Buzzo says it will be finished within forty days. An engine large enough to continue the work of hoisting will be put in and operations go on as before.

NEVADA.

HUMBOLDT COUNTY.

The Lovelock Tribune says that men employed in the sulphur mines near Black Rock are invariably healthy and those who go there with blood and skin diseases are speedily cured by the contact with the sulphur.

LINCOLN COUNTY.

The railroad of the Quartette M. Co., Searchlight, from the mine to the mill on to the Colorado river, is 16 miles long; to the mill the elevation is 3000 feet below the terminus at the mine; maximum grade 5.8%. The loaded train runs down by gravity and the climb is maintained with empty cars. Each returning train takes up a flat car of water barrels, which return empty by gravity. Oil is used for fuel on the engine.

The Tribune reports McNamee, Linney and Keets organizing the Cold Turkey M. Co., to work seven locations 5 miles north of DeLamar.

NYE COUNTY.

The strike of a ledge in the shaft of the Mizpah Extension Co. at a depth of 430 feet has encouraged the company in its work, as it is locally considered to prove that the ledges exposed on the Mizpah ground extend under Mount Oddie. The same blue lode porphyry that is encountered on the west side of the mountain are assumed to exist on the east field, when depth is attained, to prove as rich as any that has been opened up.

Near Austin, J. Casserly has sold the Yankee Blade mine to T. L. Oddie of Tonopah. The ore is ruby silver and in the bottom of the incline a body of ore is

exposed, but it will remain there until pumping machinery is installed.

At Toopah, the new shaft being sunk on the east extension of the Mizpah has lode porphyry in the bottom at a depth of 200 feet.

In San Francisco on the 6th the Butte-Tonopah M. Co. was organized. Directors: Lee Mantle, Butte, Mont.; J. L. Merrill, San Francisco; T. L. Oddie, general manager Tonopah M. Co.; R. Dougherty of Tonopah, superintendent of Lease No. 2 on the Mizpah vein; D. J. McDonald, Rossland, R. C.; F. O. Chamberlain, Bakersfield, Cal., and J. Gerber, Lincoln, Colo.; W. C. Beattie is secretary.

Another strike is reported in Tonopah, the shaft in the Ohio Extension in ore at a depth of 300 feet, averaging \$160 a ton, an extension of the Mizpah formation. The strike is half a mile from the last proven ground.

NEW MEXICO.

GRANT COUNTY.

Silver City reports a miolog sale in Burro Mountain miolog district—the Comacho group—to J. S. Curry for \$105,000. The new owner intends to put a leaching plant on the property; capacity, 200 tons daily.

Half of the force of workmen for the Colorado Fuel & Iron Co., at Fierro, has been laid off for an indefinite period and the output of iron ore materially decreased.

LINCOLN COUNTY.

Preparations are being made by the Rincon M. & M. Co. to begin active operation in the Jicarillas.

SOCORRO COUNTY.

Machinery for a 30-ton concentrator has been ordered for the Cooney mining district, as an addition to the Silver Bar mill, capable of treating fifty tons of ore per day.

OREGON.

BAKER COUNTY.

Development work has begun on the Oregon Chief, the property of the Oregon Chief G. M. Co., Cable Cove district, Pollman, Lack & Donnelly. There are 1300 feet of tunnels and shafts. It is the plan of the company to sink a shaft on the pay shoot, a mill, hoist, pump, etc., to be erected on the property at once.

W. H. Gleason has a prospect 1 mile from the North Pole mine, in the Cracker Creek district, which he has located as the Buckeye group. It is only a prospect, but the surface indications show a lead 40 inches wide, assays \$58 per ton.

GRANT COUNTY.

The Hoosier Boy mine, 4 miles from Canyon City, has a 25-stamp mill in operation. The mine employs thirty-five men.

The Great Northern mine is $2\frac{1}{2}$ miles from Canyon City. It has a 2-stamp mill of the Tremaine pattern, operated directly by steam power.

JOSEPHINE COUNTY.

At the mines of the Waldo Smelting & Mining Co. a new town has sprung up called Taklima.

MARION COUNTY.

At Salem, the Universal G. M. E. Co. is organized. It is the purpose of the company to "purchase the tailings of a large mine in California" for about \$8000, and employ a secret process W. L. Long claims to have discovered for extracting gold from the tailings of a mine. About \$5000 will be expended in the purchase of an air-compressing machine.

SOUTH DAKOTA.

LAWRENCE COUNTY.

D. N. Heizer of the Spearfish G. M. Co., owning several hundred acres mining land in Ragged Top mining district, says that with the second gold brick turned out by their mill in August the company was put out of debt. The brick ran about \$11,000 and represented a fifteen-ton run. The output of the mine for August was \$22,000 net to the company. The Spearfish suffered the loss of its entire surface plant by fire last January, so that the operations of the company were interfered with. The new mill was constructed at a cost of \$75,000, and is now in running order, equipped to handle 300 tons a day. The present output treated is about 5000 tons a month.

The Dakota M. Co. is shipping its ores 40 miles and reducing them at a cyanide plant in Deadwood which has a capacity of 100 tons daily. The total cost of mining, shipping and treating is \$2.83 per ton. Of this, 75 cents per ton goes for hauling, leaving \$2.08 for mining and milling. The ore will average about \$8 per ton, and the average extraction at the mill is 84%. The ore lies practically on the surface and is taken out of open pits at small expense. The company is preparing to enlarge the mill to 200 tons capacity.

The Homestake mine yields 3000 tons of ore daily, which is worked through a 900-stamp mill. The ore is not free milling,

carries a good deal of iron and has to be amalgamated before cyaniding. The company has a 1000-ton cyanide mill in which the siliceous ore is worked. There are no sulphides in the district and some of the companies have to depend upon Montana for their sulphides to mix as a flux with their own ores. For a number of years the copper ore of the Speculator mine in Butte was shipped to Deadwood. The Ellison hoisting plant has a sinking capacity of 2000 feet through a four-compartment shaft. The deepest mine in the section is 1100 feet. The veins, as a rule, widen with depth. In the Highland mine, one of the Homestake properties, the vein was only of knife-blade thickness at the surface, and now at a depth of 800 feet it is 525 feet wide. The company employs, all told, about 1500 men. The Golden Reward mine has 2500 acres of patented mining ground and employs from 500 to 600 men. It has a smelting plant at Deadwood for the handling of the iron ore and another smelter for the treatment of the oxidized siliceous ores. The Horseshoe Co. owns a large number of claims, and has put in a new smelter of 300 tons capacity. It also operates a 1000-ton cyanide mill; daily output, 1000 tons ore. Near Lead, the Columbus G. M. Co. has two cars of machinery. Enlarging the Columbus shaft from two to three compartments is nearly completed.

The Pluma compartment shaft is down 300 feet. Superintendent Fillion will put in a 6-drill compressor.

E. Wade is sinking a two-compartment shaft on the ground of the Globe Gold G. M. Co., southwest of the Hidden Fortune territory of the Fort Pierre Railway, and will put in a hoisting engine of 1200 feet capacity, boilers, air compressor, machine drills, pumps, etc.

The Horseshoe Co. will build the stamp, wet-crushing cyanide mill at the mines near the Mogul shaft, 1 mile south of Terry. The ore will be transported to the mill by aerial cable tramways.

At Deadwood the Sun Dance shaft of the Golden Reward M. Co., Ruby basin, is on fire. Twelve mules are burned; all the miners are out and no lives lost. Attempts are being made to suppress the fire by sealing the entrances and shutting off the circulation of air.

The ore shoot of the Otto Grantz mine, now owned by the Hidden Fortune G. M. Co., has been reopened. Men have been engaged for some time stripping the surface, preparatory to milling the ore, and have been engaged putting drill holes down over an area of several acres. The drillings have been assaying from \$4 to \$40. Last week the miners struck the continuation of the shoot of ore that O. Grantz discovered three years ago, and from the drillings from three holes put down the assays gave returns of \$1400, \$1900 and \$1500, respectively.

The Columbus Con. Co. have received two carloads of machinery. The compressor plant is being placed on the foundations. The Columbus Co. controls 645 acres of ground containing extensions of the Homestake and Hidden Fortune mines on the north. M. Thompson is manager.

A large force is employed at the property of the Grantz G. M. Co., under the management of O. P. H. Grantz. The company owns 300 acres of ground.

The Review says the Golden Reward Con. M. & M. Co. has the only smelter in operation in the northern Black Hills at present. The National Smelting Co. built a 300-ton plant at Rapid City and is about to sell to the Horseshoe M. Co. The Golden Reward smelter at Deadwood was built by the Deadwood-Delaware Smelting Co. and sold to the Golden Reward four years ago. It has a capacity of about 400 tons of ore a day, and is operated largely on the siliceous ores from the Golden Reward Co.'s Bald Mountain and Ruby Basin mines, although it treats a large quantity of custom ore. The National Smelting Co. built its plant at Rapid City chiefly for the custom ores of the Black Hills, but was unable to keep it supplied.

PENNINGTON COUNTY.

The National Smelting Co. of Rapid City has closed the deal which makes the smelter at that place the property of the Horseshoe M. Co. The smelter is expected to start up Oct. 1.

UTAH.

The gold output of Utah is as follows, from a report by B. H. Tatem, who says: "The gold, silver, copper and lead of Utah were valued at \$27,091,709 in 1901, the greatest in the history of the State, and a gain of more than \$4,000,000 over 1900, which had previously shown the greatest yield. In recent years no gold has been taken from Utah placers. The decrease in the gold output was general throughout all branches of mining. The mining of silver in Utah is done largely in connection with mines carrying lead and other metals. The mining of such ores was curtailed by the decline in the

price of silver that occurred in 1901. Two-thirds of the entire silver yield of the state originated in ores carrying lead, thus giving importance to this class of mining far greater than attaches to the others."

The production of gold and silver in Utah by counties for 1901:

Counties.	Gold.	Silver.
Beaver.....	\$ 20,748	\$ 552,574
Juab.....	830,159	3,472,465
Plute.....	372,252	62,336
Salt Lake.....	576,983	914,029
Summit.....	283,852	9,128,887
Tooele.....	1,673,979	395,579
Utah.....	2,480	827
Wasatch.....	7,022	8,149
Unclassified.....	52,735	100,929

IRON COUNTY.

On Iron mountain within a year the first furnace will be in operation. The new company has offices in Cedar City.

The Oregon Short Line will construct a branch railway from the main line at Lund to Desert Mound. Owners of the group of claims will produce 300 tons of iron fluxes daily for use at the furnaces of the A. S. & R. Co. The Tribune says for some time the smelting company has been drawing on the mines of Leadville for 100 tons daily of argentiferous manganese, but the haul is long and expensive and the local article will, at the completion of the railway branch, have the preference.

JUAB COUNTY.

Judge Marshall of the Federal Court has rendered a decision in the Mammoth-Grand Central case, Eureka, that permits the Grand Central M. Co. access to the ore body from which for three years it has been excluded, and which practically settles the litigation between the two companies. Men were immediately put to work in the disputed territory.

At the Lower Mammoth that camp assays on the new ore body in the west drift show from eighty to ninety ounces silver per ton.

Superintendent Ball, Lower Mammoth, Tintic, in the west vein on the 600-foot level, has ore which shows 100 ounces silver.

The ore shipments from the Tintic district for August amounted to 273 carloads. Following is the output for the month:

	Cars.
Gemini.....	26
Bullion-Beck.....	28
Eagle & Blue Bell.....	10
Uncle Sam.....	12

PLUTE COUNTY.

At the Annie Laurie on Gold mountain the enlarged mill is treating 300 tons every nineteen hours.

The Snow Bird M. Co. has incorporated at Marysville to develop the Mountain Queen, the Mountain Queen No. 2 and the North Fork lodes, Ohio mining district. A. H. Franklin, B. Reynolds, J. M. Hansen, secretary, J. L. Leilich, E. E. Mork.

SALT LAKE COUNTY.

Superintendent Nutting of the Bingham Con. smelter, during August produced nearly 800,000 pounds of bullion. This month the fourth furnace will be put in commission as soon as the enlargement of the converter annex is completed.

Manager Farnsworth expects to utilize the 35% zinc ore in the Horn Silver mine, and has forwarded a 500-ton consignment to the reduction companies at Iola, Kan. Two years ago a 500-ton lot of the ore was brought from the mine to be sampled and sent abroad to learn what kind of treatment it required. Negotiations were broken off and the ore unloaded in the sampler yards. Recently the demand for zinc has increased, and several of the eastern companies want to know if the ore could not be handled profitably.

At Bingham, the Dalton & Lark tunnel, belonging to the Bingham Con. Co., drains the workings of the property at a depth of nearly 2000 feet. Various veins carry values of 20%.

At some of the Bingham properties the

contract system, as employed in Rossland, B. C., and elsewhere in ore extraction and development work, has made its appearance among the metal-bearing mines of the State at the properties of the Bingham C. & G. M. Co., inaugurated by Manager McVichie. Last month Manager Channing put it on trial at the Highland Boy. The Tribune says under the system the wages of those who have taken to it—186 at the Highland Boy—now ranges from \$3 to \$3.75 daily. Under the former system the same men averaged about \$2.75 a day. The system consists of running a drift, sinking a winze or making an upraise at so much per foot, while those employed in the stoping of ore are paid so much per ton for the volume extracted. Manager Holden of the U. S. M. Co. says the system will be introduced at his company's Bingham properties. It is simply "piece work" applied to mining as with machinists, compositors and other skilled intelligent men.

The fourth furnace, A. S. & R. Co.'s plant at Murray, is in operation.

The U. S. Co.'s plant will start this month.

Last week Bingham Con.'s furnaces turned out 186,243 pounds of copper, gold and silver-bearing bullion, which was forwarded to the Eastern refinery. The Highland Boy sent nearly 300,000 pounds.

At the various plants are employed about 1200 persons.

SUMMIT COUNTY.

The Tribune says that the Silver Key and Keystone groups, at Park City, have been acquired by D. H. Peery with local and Eastern associates.

WASHINGTON.

The output of metals in Washington for the calendar year 1901 was:

	Value.
Gold, ounces.....	31,987 \$661,239
Silver, ounces.....	337,381 487,927
Copper, pounds.....	23,529 4,757
Lead, pounds.....	216,841 9,396
Total.....	\$1,163,320

FERRY COUNTY.

Grand Forks, B. C., reports 250 tons ore from the mines at Republic delivered by the Kettle Valley Lines at the Granby smelter: San Poil, 100 tons; North San Poil, 100 tons; Princess Maud, 50 tons. The smelters at Greenwood and Boundary Falls have agreed to take a maximum of 125 tons of Republic ore daily. The Kettle Valley Lines and the C. P. R. will quote the same freight and treatment rate, \$6.50 per ton for Republic ore delivered to the smelters at Greenwood and Boundary Falls.

PIERCE COUNTY.

The Tacoma Smelting Co., owned by D. O. Mills and associates, has started its copper reduction works. After being crushed the ore is mixed with coke to produce a matte of 40% copper, going thence to the smelter, where pyritic furnaces are used.

OKANOGAN COUNTY.

At Chesaw W. T. Mendenhall has bonded the Grant group of claims on Copper mountain for \$40,000, in payments lasting a year. He has men at work.

S. S. Calahan has charge of the work on the Rainbow mine.

Superintendent E. P. Gallac of the Beaver Lake mine says that he is negotiating with the railroads for hauling the ore from the mine to the smelter.

Work has begun on the Old Germany mine. There is 300 feet of tunnel on the property. The work will be under the supervision of C. Davidson.

SNOHOMISH COUNTY.

The men at the Monte Cristo smelter demand \$4 for twelve hours' work, or \$3.50 for ten hours, instead of \$3.50 for twelve hours, which they now receive. The company is hiring men from Idaho.

WYOMING.

CARBON COUNTY.

Cheyenne reports that for the sale of the Ferris-Haggerty mine to the North American Copper Co. W. G. Emerson and J. S. Cary received a commission of 10% of the purchase price, or \$100,000, to be divided between them and several others who assisted.

FREMONT COUNTY.

A plant of steam machinery has been installed on the property of the Tully Copper M. Co. at Pearl. It is the intention to sink 500 feet and cut a station every 100 feet.

A strike of galena ore has been made in the Sierra Madre property near Pearl. The shaft will be continued on an incline to follow the ore which is dipping to the south. Assay: gold, .20 ounce, value, \$4.13; silver 17 ounces, value, \$9.01; lead, 3.50 ounces, value, \$2.45; copper, 72%, value, \$1.65.

FOREIGN.

BRITISH COLUMBIA.

The Mines Exchange of Nelson reports a ledge of galena and grey copper averaging from 10 inches to 3 feet in width, 90 miles north of Grand Forks. Specimens assay fifty-five ounces silver and 10% copper per ton respectively.

In Nelson district a 5-stamp mill is now on the ground at the Referendum, Ymir. Extra men have been employed at the Poorman-Granite and Molly Gibson, which are both looking well.

Kaslo and Slocan silver-lead shipments continue to improve. Profits are, as a rule, small. A number of the mines are only making working expenses; in general only the richer properties are producing largely.

H. Z. Brock, manager Camhorne group, owned by the Northwestern Development Syndicate, is superintending the erection of a 10-stamp mill and 5000 feet aerial tramway.

Ymir sends the report of E. Hooper on the Ymir mine. He agrees with Mr. Fowler, the company's engineer, in his estimate of ore in sight, which he figures at 106,000 tons, with a gross value of \$7.50 a ton, or \$800,000—enough to supply fifty stamps for 2½ years, or the full complement of eighty for a year and a half, independent of ore which will be opened up by future developments.

"The presence of bunches or seams of zincblende, galena or iron pyrites in the quartz has hitherto been regarded as the chief indication of the presence of sufficient gold and silver in the ore to render it payable. That the occurrence of these minerals in the ore is no criterion as to the accompanying precious metals, is sufficiently borne out by the recent developments in No. 10 level, where the quartz carries about the same quantity of the sulphurets as near the surface, but very little gold or silver. However, at the present east face of No. 10 level the ore shows an increased quantity of sulphurets, and a selected sample here taken gave a value of \$7.51, which is a higher result than any hitherto obtained. The ore is chiefly composed of quartz, with which is associated about 8% to 10% of sulphurets of lead, iron and zinc. The gold evidently occurs for the most part in a free state, over 60% being saved by amalgamation in the stamp mill and about 15% by concentration over the vanners, the average value of the gold left in the tailings being about \$1.75 per ton of ore treated. The concentrates shipped to the smelters from the commencement of operations by the company to Dec. 31, 1901, contained the average of 1.01 ounce of gold and 12.22 ounces of silver per ton and over 20% of lead. The efforts of the management are directed toward keeping the zinc contents of the concentrates down to about 10%, since a penalty of 50 cents is imposed by the smelters for each unit over 10%. Cyanide operations commenced in March last, and up to June 30 11,127 tons of tailings had been treated. According to the assays of the tailings and residues, about 835 ounces of gold and 3116 ounces of silver have been saved theoretically, although the actual results, which are not yet obtainable, will undoubtedly be considerably less. The operation of cyaniding has naturally been attended at the outset with many minor difficulties, and the average cost per ton of the tailings treated, viz., 63 cents, is high, and should still be reduced. The total gross product and value of same to June 30, 1902, has fallen from \$11.94 in 1899 to \$6.84 per ton during 1902. This decrease in values was rendered more apparent than real by the extraction and shipment to smelters during 1899 of a considerable quantity of rich carbonates and crude ores. At the same time it can not be denied that a lower grade of ore is being worked than hitherto. With the observance of greater care in mining, much of the poor and sterile rock in the ore could be prevented from being sent to the mill, as at present, and so maintain an average value of at least \$7.50 per ton in the ore milled."

Next to the Rambler, the Payne mine has the largest payroll in Sandon. There are seventy men working, and twenty-five more employed in and about the mill and lower terminal. Power and light for the mine and camp are generated at the mill. The shipments last month were 250 tons. The Rossland Miner produces a statement of the ore shipped and the average assays values contained therein from the Le Roi mine in the past eight months:

Month.	Tonnage.	Assay Value Per Ton.
December, 1901.....	16,556	\$11 40
January, 1902.....	19,640	10 74
February, 1902.....	18,794	10 72
March, 1902.....	24,528	9 92
April, 1902.....	25,593	10 25
May, 1902.....	13,047	15 86
June, 1902.....	11,475	17 70
July, 1902.....	14,492	17 67

These figures are reproduced by the Miner in refutation of the statement from

the late metallurgist at the Le Roi smelter at Northport, to the effect that the profits the Le Roi Co. has made during recent months were not produced as a result of the shipment of a better grade of ore from the mine, but from economies which he had succeeded in effecting at the plant.

H. N. Allen, superintendent American Boy, Sandon, has banded the Planet and Comet and begun active development.

Operations are to be renewed on B. C. mine at Eholt. The mine is owned by the B. C. Chartered Co. of Montreal. It was worked with very little intermission from the summer of 1897 until January, 1902; owing partly to the low price of copper, it was closed down. During 1900, which was the first year ore was sent to the smelters in quantity from the Boundary mines, the B. C. shipped about 19,500 tons of ore to the smelter. The output for 1901 was 48,000 tons; the small shipments during the current year bring the gross output of the mine to about 70,000 tons, giving an average assay of 0.015 ounce gold, 2.45 ounces silver and 5.8% copper (wet assay) per ton. About four-tenths of this ore went to the Trail smelter and the remainder to the British Columbia Copper Co.'s smelter at Greenwood. The ore is chalcopyrite, pyrrhotite and some pyrite, with small quantities of gold and silver. About 7000 lineal feet of work in all has been done in underground development.

The Velvet mine, Rossland, has resumed shipments. This time the ore is being sent to the Northport smelter. The ore has been high-grade picked material. The low-grade ore is being reserved for treatment in the concentrating plant now in course of construction. The system to be utilized in the plant is a water process. The last shipments from the Velvet were sent to the Hall smelter at Nelson, but the copper furnaces at the Nelson plant have been shut down since the last ore from the Silver King mine was treated, hence the change of destination to Northport, Wash.

T. G. Blackstock of the War Eagle and Center Star mines, Rossland, B. C., says: "It has been apparent to us that the charges of mining and development in Rossland on the one hand, and of freight and treatment of ores on the other, were such as to preclude the possibility of these mines paying the dividends that were expected. The reason for this was that the high-grade ore bodies were segregated, and a great deal of dead work had to be done to reach them, often through ore of too low a grade to stand these charges. It appeared to us, therefore, imperatively necessary to obtain, first, a substantial reduction in the cost of mining, freight and treatment, and, second, to discover some means of handling these low-grade ores at some profit. Since dividends were last paid we have succeeded in reducing the cost of mining development very materially—in fact, from about \$4 a ton to \$2.10 a ton, or cutting it almost in half. This has been done chiefly by introducing a modified form of contract system. It was only lately, however, that the smelter people saw their way to make such a reduction in the freight and treatment charges as would justify us in commencing shipping on a large scale. Meanwhile during the past three years development work has been pushed, and even while not shipping we have had at least 225 men employed constantly in the two mines. The whole cost of freight and treatment has been reduced from \$6 to \$5 a ton on ores containing values to the amount of \$9.50, while on ores under this grade the charges have been reduced from \$6 to \$4. During this time, also, attention was paid to the problem of treating the low-grade ores by some process other than smelting. As the result of our experiments we have secured a mill at Silica, on Sheep creek, a few miles from Rossland, which we have reconstructed and enlarged to a capacity of about 100 tons a day. It is not intended to use this mill for anything except experimental purposes, as a guide to us in erecting a larger mill, of a capacity of 500 tons or more per day, which mill we propose to erect next spring. I think that I can safely say that \$5 ore may be treated by milling at a profit. For reasons well known to mining men, high-grade ores can generally be more cheaply treated by smelting. I am satisfied that in a few years we shall be able to treat \$4 ore at a profit. Under our new contract the two mines are to deliver 12,000 tons a month of high-grade ore, and as much more under the \$9.50 limit as they choose, which will probably be from 6000 to 12,000 tons a month more. We have not shipped in any quantity since the strike of a year ago last July, but have simply been making shipments from time to time of ore encountered in development, and also shipments to test certain ore bodies. I would like to emphasize the fact, however, that we have never ceased operations, whether we shipped or not. At the time of the strike 500 men walked out, but since then we have had 225 men working on devel-

opment work continually. I expect in a few weeks we will have fully 500 men employed again."

Directors of the Snowshoe Gold & Copper Mines, Ltd., owning the Snowshoe mines near Phoenix, are at Grand Forks looking for a smelter site. They say: "Our mines are now developed to the stage when they can produce a daily tonnage of 600 tons, a figure that can soon be very largely increased. Our idea is to erect a 1000-ton plant."

CANADA.

The report of the Ontario Bureau of Mines shows that in 1901 that province produced minerals to the value of \$11,831,086, of which \$5,016,734, or 42%, represented the metallic output. The nickel output is represented by 441 tons, valued at \$1,859,970, which is an increase of 145% in value and 25% in quantity over the year 1900. The quarterly statement of the bureau also shows that the value of the nickel output this year is \$354,498 in excess of the corresponding period of 1901. The copper product of 1901 amounted to \$589,080; the value of the output for the first quarter of 1902 over that of 1901 amounts to \$121,545. The wages of the 2284 men employed in the nickel-copper industry for the year amounted to \$1,045,889.

MEXICO.

Monterey reports the sale of Bolonitos mine in Guanajuato for \$250,000. The purchasers are Boston men principally. Some of the men in the deal are E. L. White, D. McViehe, A. W. Hale and J. A. Coram. The Bolonitos is an old mine and has a record of \$7,000,000 production; \$50,000 cash has been paid, the balance within twelve months, when the transfer will be completed. The mill at the Cochiti, New Mexico, may be used.

OAXACA.

The Sierra Juarez M. and D. Co., with a capital of \$2,000,000, is organized in Colorado Springs to operate mines in Oaxaca.

SONORA.

The American-Mexican Copper Co. is formed at San Diego, Cal. C. E. Warfield is president. Another new company organized at the same place is the Gold Galore M. Co. W. R. Andrews is president. Both companies have acquired properties in the Magdalena district of Sonora.

W. T. Meade of San Francisco and W. Short of Caballona, Sonora, have mining property 15 miles south of Douglas, a ledge of copper-bearing ore. There are two shafts on the property, one about 80 feet and the other 125 feet in depth. A San Francisco company has been formed to work the property on an extensive scale. Hoisting works and a pump will be placed on the property.

At Monterey, the Arizona-Mexico Copper Co. has incorporated under both American and Mexican laws, to exploit Gran Province Dora de Cobre mine, consisting of twenty pertenencias, at Co-boetia.

Campo Santo Ninyo, where the Yaqui Copper Co. is operating, reports six shafts now sinking and eleven tunnels running, all in ore.

The Tubutama M. Co. are developing their property near Penyasco Quemado, Altar.

C. Hayes has organized the Hayes M. & M. Co. The company will erect a 10-stamp mill at the Pineta mountains, southwest of La Cananea.

NEW CALEDONIA.

G. M. Colvocoresses, commercial agent at Noumea, reports the formation of an American company with mining interests on that island. The mines of New Caledonia have for some time exported considerable quantities of nickel and chrome to the United States, and these exports are certain to increase. The International Nickel Co., the new concern, is composed entirely of Americans, and in connection with Le Nickel Co. of Paris, may control the nickel production of the world. The properties of this company embrace much fine mining land in New Caledonia. The feeling on the island is cordial to American enterprise, and should the Oceanic line make its proposed change of route, stopping at Noumea, one may expect to see this colony dealing almost completely with commercial houses in the United States. There will then be an excellent chance for firms upon the Pacific coast to do direct business with Noumea, as merchants there realize that they can buy supplies more advantageously in our country than in Australia or Europe, provided proper transportation facilities are afforded.

SOUTH AFRICA.

Johannesburg in July produced 149,179 ounces fine gold, an increase of 6399 ounces over June. For the calendar year from Jan. 1 to July 31 the total output is 806,021 ounces fine gold, \$16,660,454. There

is a new departure in the manner of calculation, all returns from the Transvaal now being made in fine gold.

SOUTH AMERICA.

J. W. Mercer has returned to Colorado after a stay of two years in Ecuador. The property where he has been manager is owned by the South American Development Co. of New York. The property is in the Andes, 60 miles southeast of Guayaquil. The principal mining there is quartz. The ore is a blue-white quartz, carrying about 12% in sulphides, lead, zinc, copper, iron, and some fine, free-invisible gold. The methods used are amalgamation and cyaniding. He found there a 40-stamp mill, with cyanide plant to correspond, but had difficulty in getting the values. The stamp mill could save but a very small proportion of the values, and the cyanide mill was doing little or nothing. He finally raised the extraction from 10% to 70% of the material treated. It is amalgamation followed by cyaniding. There are numerous old Spanish mines which were worked 200 years ago. He had to pack everything on mules for 50 miles. The biggest enterprise in the country is the Guayaquil & Quito Railway, between those two cities. Quito is the capital of Ecuador and is situated away up in the mountains. The distance between the two cities is 300 miles, and about 75 miles of the railway is built. At present they are making little progress.

SUMATRA.

J. F. Parks, superintendent Kennedy mine, Amador county, Cal., has a letter from H. A. Gelsendorfer which, published in full in the Jackson, Cal., Dispatch, is interesting. He says he is 250 miles north of Padang. His concession on the headwaters of the river Godio includes 25 miles of that river from its source and 500 meters on each bank. The country is covered with jungle. A zone of badly metamorphosed slate crosses near the head of the concession. Limestone is plentiful, but the greater bulk of the formation is made up of igneous rocks, granites, diorites, gabbros, porphyrys, diabases, andesites, basalts, acid tufts and conglomerate. Contacts are numerous, but as a rule are barren, and without a vein; when a vein is present it is generally a small one of limestone. A cobble of quartz in the river is quite uncommon, and a color of quartz gold quite as rare. All the gold in the river exists in very small thin flakes or in light porous porphyry gold. Much of the granite, syenite and diorite contain small amounts of gold. Eight cents per cubic meter is the best prospect. Good labor is obtainable at 20 cents per day (American), and find itself and water is abundant. The gravel will not average more than 5 cents (American); large boulders are plentiful in the wash; the gravel will not average more than 8 feet deep; all the available bars are cultivated rice fields, which, if worked, would have to be reconverted to agriculture. The gold is very light and hard to save, and the river cannot be worked on account of the recurring floods. He has reported unfavorably on the concession.

A doctor reported on this concession a year ago and he panned along the surface of the bars and reported millions of tons of gravel averaging two grams gold per ton (about \$1), and recommended putting four large dredgers on the river, with a grade of from 40 feet to 80 feet per mile, bed-rock often sticking above the water, boulders half the size of a house.

Mr. G. says: "I do not believe this will ever be much of a mining country. There may be a few good reefs and some dredging properties, but further than that there is not much prospect. This island has been mined for a thousand years. Two hundred and fifty years ago it was overrun by the Hindoos, who mined it with the precision of the Chinese."

THE KLONDIKE.

The Forty-Mile mining district reports that mining operations are being extended. The largest enterprise in the Forty-Mile district is being carried on by the Peterson brothers, who have been working for two years at Kink, or Bend river, 22 miles above the mouth of the North Fork. They are hacked by Chicago men, and by tunneling through the neck of the peninsula have diverted the channel of Forty-Mile river and drained absolutely dry nearly 3 miles of the North Fork river bed. The gold gravel of the former channel is being worked with horse teams and scrapers. Sluice boxes have been built, the gravel being scraped into them and washed with water taken from the Forty-Mile at the point where the stream was diverted. Fifty thousand dollars have been expended and the plant will be further extended by the hydraulic system to be operated with giants.

Teaming in Dawson is nearly all done with dogs; it costs \$1200 to winter a horse in that country.

Personal.

H. A. WILDER is manager of Northland mine, Loomis, Wash.

JOHN DERN has returned from California to Salt Lake, Utah.

M. WILLIAMS is now foreman Globe-Boston C. Co., Globe, Ariz.

D. R. WILLIAMS has taken charge of the Carlsbo mine, Tintio, Utah.

GEO. HENRY is superintendent Dragonoon C. M. & S. Co., Tombstone, Ariz.

C. A. MOLSON of Utah is examining mining property at Custer, Idaho.

E. C. LOFTUS has returned from the State of Maine to Railroad Flat, Cal.

M. F. SAMMON, foreman at the Gemini mine, Tintio, Utah, has resigned his position.

W. H. STORMS of Sutter Creek, Cal., is examining mining property near Copley, Cal.

M. NELSON, foreman Creston-Colo., Minas Prietas, Sonora, Mexico, is in San Francisco.

W. H. HOYT, vice-president Allis-Chalmers Co., has returned from Denver to Chicago.

S. C. HODGES is in San Francisco. He is successfully managing a 750-ton smelter at Granby, B. C.

L. H. CARVER has returned to San Francisco from an examination of Tuolumne Co., Cal., mining properties.

CHAS. D. WALCOTT, Director U. S. Geological Survey, is at Markleeville, Cal., viewing reservoir sites in that vicinity.

W. H. BUNCE of Ouray, Colo., has been appointed general superintendent North American Copper Co., Encampment, Wyo.

J. E. COOLIN, interested in York, Alaska, tin placers, says he recently found a 25-pound chunk of tin on Birch creek.

S. BOWERS, of the California State Mining Bureau, is at Chula Vista, San Diego Co., Cal., observing the oil indications there.

W. H. HAMPTON, Placer, Josephine county, Or., has charge of operations in the mines of the Columbia Mines Co., on Galice creek, Or.

T. T. LANE is in San Francisco from Nome to buy a 10-stamp mill to ship to Nome, Alaska, starting quartz mining on Seward peninsula.

F. M. BISBEE, late chief engineer Tennessee Central Ry., has been appointed general manager Los Angeles L. & W. Co., Los Angeles, Cal.

JOSIAH PHILLIPS, who had charge of the Mary Harrison 40-stamp mill, Coulterville, Cal., is now in charge of the Mt. Jefferson mill, Groveland, Cal.

GEO. FELT takes the position at the mill of the Idaho Springs M. & R. Co., Idaho Springs, Colo., made vacant by the resignation of A. G. Valentine.

W. S. BAKER, general manager General Concentrates Co. of New York, for New Mexico and Arizona, has gone from Tombstone, Ariz. to El Paso, Tex.

T. J. HURLEY, president Natalie and Occidental M. Cos., Colo., and Mines Securities Corporation of New York, has returned from Alaska to New York City.

MCLEAN & PROBERT, mining engineers of Los Angeles, Cal., are at Globe, Ariz., examining the mines and smelter of the Old Dominion Copper Co. for Boston capitalists.

R. MORAN, of the Moran shipbuilding yard, Seattle, Wash., was in San Francisco this week to get non-union men to work on the battleship Nebraska, being built by his firm.

W. A. PRICE succeeds F. H. Smith as assistant manager A. S. & R. Co. at Salt Lake, Utah, on the 15th. The latter assumes charge of the company's affairs at East Helena, Mont.

L. B. DOE and E. J. MOLERA, owners of the right to the Crown Gold dry concentrating process in Mexico, are in Durango to install a concentrating plant on mining property owned by the San Luis M. Co. near that city.

THOS. CORNISH of Georgetown succeeds A. J. Shipman as manager of the Stratton's Independence mine in Cripple Creek district, Colo. Mr. Shipman cabled his resignation to London Sept. 5, having received a flattering offer elsewhere. He and his assistant, R. J. Grant, will remain in charge of active operations at the mine for the present.

C. A. MALM and C. D. Porter, of San Francisco, are in Salt Lake, Utah, the guests of W. F. Snyder, president Western Exploration Co. Mr. Malm is one of the owners of the Balakiala group of mines, Shasta county, Cal., upon which the Western Exploration Co. has an option requiring the payment of \$750,000. The Tribune says he is there to close the trade with the company.

Latest Market Reports.

SAN FRANCISCO, Sept. 12, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 51½c, refined (1000 fine); San Francisco, 51½c; Mexican dollars, 43½c San Francisco, 40c New York.

COPPER.—New York: Standard, \$11.00@11.50; Lake, 1 to 3 casks, \$12.25; carload lots, \$11.60; Electrolytic, 1 to 3 casks, \$11.75; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.60; carload lots, \$11.30. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £53 7s 6d spot per ton.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 17s 6d per ton.

SPELTER.—New York, \$5.50; St. Louis, \$4.50; London, £19 7s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$27.80; San Francisco, ton lots, 29c; 1000 lbs., 29c; 500 lbs., 29c; 200 lbs., 29½c; less, 30c; bar tin, 35c. London, £123 spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48 00 large lots; London, £8 15s; San Francisco, local, \$46.00 per flask of 7½ lbs.; Denver, \$49.75. Export, \$44 50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 19.50c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c per lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$21.75; gray forge, \$20.50; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31 and \$31.50; open hearth billets, \$33 and \$34; San Francisco, bar, 7c to 12c per lb.

No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less

than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg. CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$5.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c per set; 14 oz., 40s., 9c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$11.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$13 per ton in bulk, \$15 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c per lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 5c; alum, \$2.00@2.25; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3½@4c per lb.; Cal. s. soda, bbls., \$1.25 @1.50 per 100 lbs.; sks., \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs., 25c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., 95c; cs., \$1.05; Neats-foot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, 4c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6½c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c per lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 30c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) per lb., \$1.25.

MERCURY.—Bichloride, 30c per lb., 90c.

MOLYBDENUM.—25c. ½ gramme=2½ lbs.

PHOSPHORUS.—(American) per lb., 80c.

SILVER.—Chloride, 30c, 75c; nitrate, 55c.

SODIUM.—Metal, 30c per lb., \$1.00.

URANIUM.—Oxide, 30c per lb., \$3.50.

ZINC.—Metallic; chemically pure, 30c per lb., 50c.

ZINC.—Dust, 30c per lb., 10c.

ZINC.—Sulphate, 30c per lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Commercial Paragraphs.

The Jeanesville Iron Works Co., Denver branch, has sold the El Paso Con. G. M. Co., Cripple Creek, Colo., a triple expansion pump, capacity 21,000 gallons, 750-foot lift, latest pattern, fitted with Corliss steam valves, the largest pump in that district. They are also building a compound condensing pump, 1000 gallons per minute, 1000-foot lift, for the Golden Cycle M. Co., Colorado.

N. S. CLARKE, manager Yreka Copper & Development Co., Victoria, B. C., has ordered from the Compressed Air Machinery Co., San Francisco, a 10-drill compressor.

Books Received.

"Materials of Machines," A. W. Smith, Leland Stanford Junior University, California. Contents: Outline of the Metallurgy of Iron and Steel—Testing; Stress-strain Diagrams; Cast Iron; Wrought Iron and Steel; Alloys. Prefatory Notes: "This book is the result of an effort to bring together concisely the information necessary to him who has to select materials for machine parts." 12mo, v + 142 pages, 17 figures; cloth, \$1. New York: John Wiley & Sons.

Catalogues Received.

"Song of the Elevator," with a bar of music, is the latest leaflet issued by A. Leschen & Sons Rope Co., 920-922 North First street, St. Louis, Mo., illustrated stanzas that show considerable merit and originality. The scene of the story is set in San Francisco.

From the Denver Engineering Works Co., Thirtieth and Blake streets, Denver, Colo., is received their new bulletin No. 1016, describing and illustrating the spitzkasten or hydraulic classifier which they have developed and designed for commercial use from the experiments made by R. H. Richards, professor of metallurgy in the Massachusetts Institute of Technology. In this they direct special attention to the letters on page 7, showing the saving effected by this apparatus in actual practice. Of further deserved notice is the completeness of the bulletin in giving the general dimensions, shipping weights, export shipping weights, and space taken by shipment. On page 10 appears what they consider the first publication of a table giving the size of the particles passing through a screen, which we do not remember seeing anywhere before, and which is of more than ordinary interest and value. The bulletin is gotten up in the usual handsome style of the company, and will be mailed on request to any address.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING SEPT. 2, 1902.

708,294.—CUPIDOR RACK—F. F. Ball, Sonora, Cal.
708,453.—OLIVER BURNER—W. N. Best, Los Angeles, Cal.
708,114.—ROLLER BRAKE—L. H. Bill, S. F.
708,116.—TURNACE—M. P. Boss, S. F.
704,117.—HOSE COUPLING—V. F. Bowers, S. F.
708,199.—HAY DEHICKER—E. Brust, Davisville, Cal.
708,312.—FLOW—H. Bryan, Modesto, Cal.
708,323.—SWINGING BAR—F. R. Buck, S. F.
708,461.—TIDE MOTOR—E. B. Cade, Skagway, Alaska Ter.
708,332.—STEERING GEAR—P. L. Ehner, S. F.
708,135.—WATER TOWER—H. H. Gorter, S. F.
708,341.—WARDROBE—D. G. Graff, Fresno, Cal.
708,139.—MUSIC CHART—C. M. Halvorsen, Los Angeles, Cal.
708,353.—WALL PLASTER—C. R. Harris, Los Angeles, Cal.
708,354.—WALL PLASTER—C. R. Harris, Los Angeles, Cal.
708,227.—STEAM TURBINE—R. B. Hewson, S. F.
708,232.—SPROCKET WHEEL—D. C. Jackling, Republic, Wash.
708,233.—HOOP LUG—P. C. Jurs Jr., S. F.
708,159.—CULTIVATOR—A. K. Kopperud, Byron, Cal.
708,375.—WINDMILL—T. W. Lowe, Stockton, Cal.
708,064.—CULTIVATOR—J. A. McKinnon, El Cajon, Cal.
708,089.—BICYCLE BRAKE—G. Stahlte, S. F.
708,103.—PIPE COUPLING—H. H. Warner, Tacoma, Wash.
708,041.—PIPE JOINT—H. H. Warner, Tacoma, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ABDOMINAL BANDAGE.—No. 706,715. Aug. 12, 1902. Mildred T. Barnett, San Francisco, Cal. This apparatus is designed to provide a bandage for abdominal support and like uses. It consists in the formation of a universally elastic bandage made up at the part to be supported by cutting gore from the top and bottom, bringing the parts together and uniting the edges of the cut out portions, in addition to which reinforcing pieces are applied and elastic reinforcing strips wherever there is an increased pressure upon any part. The edges of the bandage are also reinforced and have means for the attachment of connecting strips and hands.

PRINTING PRESS.—No. 706,709. Aug. 12, 1902. H. B. Allen, San Francisco, Cal. Assigned to J. D. Spreckels of same place. In this invention, what is known as a "quadruple perfecting press," has combined with it a mechanism by which a web of paper not exceeding one-half the width of the press is taken from the rolls, passed through one side over a printing roller, thence returned to the starting point and again passed through and over printing rollers within the other half of the press where a second color or impression is applied, thence the web is transmitted to the second portion of the press which stands at right angles with the first portion, and is in like manner carried through and over rollers by which the third color or impression is applied to the sheet before it passes to the folders and eventually leaves the apparatus.

FORMING STATUARY AND OTHER ORNAMENTS.—No. 706,775. Aug. 12, 1902. Felix Peano, Oakland, Cal. This invention is especially designed for the formation of statuary or other ornamental structures and consists in imparting an outline to a natural cellular body, then varnishing with an outer coating applied in a plastic state, so that it will enter the cellular structure and form a bond or union therein.

STEAM TURBINES.—No. 706,227. Sept. 2, 1902. R. B. Hewson, San Francisco, Cal. This invention relates to an apparatus in which steam or other elastic medium under pressure is employed expansively to propel a revolvable part mounted upon a shaft through which power is eventually transmitted. It consists of an approximately cylindrical or conical part and a correspondingly shaped casing within which the first portion is journaled to fit and revolve, both of said parts

having reversely disposed open hockets (interior to the fitted contiguous surfaces, with intermediate barriers, and means admitting an elastic medium under pressure to pass alternately through said hockets.

HOOP LUGS.—No. 708,233. Sept. 2, 1902. P. C. Jura Jr., San Francisco, Cal. The object of this invention is to provide a simply constructed adjustable friction locking lug that will not require any preliminary or subsequent bending or heating, or riveting of the hoop ends used upon tanks, tanks and like cylindrical structures. It consists essentially of a chambered hook carrying roller friction members which are adapted to clamp and hold a hoop band when the latter is inserted into the chamber.

SITUATIONS WANTED.

Cyanide and Stamp Mill Superintendent or Assistant Manager open for engagement after September 1st. Graduate. A thorough assayer and chemist; also accountant. Speaks Spanish. Will go anywhere. Specialty, construction; also successful treatment of low-grade and slimy ores. References "A.I." Address Practical, this office.

Position wanted by young man with six years' varied experience at mines and mining plants as Asst. Supt., etc. Can assay, survey and attend to office work. Address A. D., this office.

ASSAYER wishes to change position. Is also experienced amalgamator and miner. Would like to take charge of small plant. Speaks Spanish. "Alenian," Mining and Scientific Press.

Wanted, position by a first-class amalgamator and millman; also mining engineer and understands assaying; has had 15 years' practical experience in mining and milling; understands the erecting of milling machinery; best of references exchanged. Willing to go to any part of the country. Address Amalgamator, this office.

GOLD DREDGING.—Mining engineer with 8 years practical experience in gold dredging, is open for an engagement. X. Y. Z., care Mining and Scientific Press.

WANTED.

Position as Superintendent or assayer. Have had experience in mining, milling, cyaniding, smelting and putting up machinery and operating the above. Have a good assay outfit. Can sharpen tools. J. L. Wetmore, 1223 S. San Joaquin St., Stockton, Cal.

A mining engineer with thorough technical and business training and 12 years experience as manager, superintendent and engineer, proficient in Spanish, wants position with reliable parties. Reference furnished. Address "Cedroa," this office.

WANTED.—Employment at mine by young, experienced Assayer, Surveyor and Bookkeeper. References. Address A. H., care of this office.

COMPETENT SUPERINTENDENT wants position in California; 15 years' experience in running mines, mills and smelters for profit, and managing men. College bred and technically educated. Formerly held positions as assayer, mining engineer, accountant, superintendent and manager. Member A. I. M. E. High testimonials. Address "Superintendent," Box 813, Seattle, Wash.

ASSAYER and MILLMAN will be open for engagement after Oct. 1st; has been employed for past two years in one of the largest modern amalgamating and concentrating mills in Colorado; had seventeen years experience in assaying or millwork, seven of which was in a Government Mint. Correspondence solicited with reliable parties only. Address R. S. B., care of Mining and Scientific Press, 606 Mack Block, Denver, Co.

WANTED.

IMPORTANT--ADAM D. GLACE.

Wanted to know address of Adam D. Glace, who left San Francisco for Alaska about two years ago. Please write S. H. Lucas, 1016 S. Olive St., Los Angeles, Cal.

WANTED.—BY TWO ENERGETIC AND EXPERIENCED mining men the acquaintance of persons interested in the development of mining property in old Mexico. Address D. L. C., care of this office.

Wanted to Bond a Dry Placer Claim, One Rich in Flour Gold.

Must be a dry proposition. Address "Placer Claim," care this office.

WANTED.

ENGINEERS, MACHINE DRILL MEN AND TOOL SHARPENERS.

Address QUARTZ MINE, care MINING AND SCIENTIFIC PRESS.

WANTED TO DISPOSE OF A Quantity of Brass and Steel Wire Battery Screen.

Address Box 66, care Mining and Scientific Press.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by hydraulic process from John Schaefer in Eda Mine, near Spanish Ranch, Plumas County, Cal., to deposit tailings in dam draining into Quilen Sake Creek emptying into Feather River; from W. J. Edwards, U. S. Webb and F. W. Hogan, in Edwards Placer Mine, near Quincy, Plumas County, Cal., to deposit tailings in dam draining into Black Hawk Creek which reaches Feather River; from Harlan Bros., in Last Resort Mine, near Sierra City, Sierra County, Cal., to deposit tailings on their land draining into Howard Creek which reaches South Fork of Yuba River; and from James Broad, in Robert Burns Gravel Mine, near Placerville, El Dorado County, Cal., to deposit tailings on flat draining into South Fork of American River, gives notice that a meeting will be held at Room 93, Flood Building, San Francisco, Cal., Sept. 29, 1902, at 1:30 P. M.

MINING AND SCIENTIFIC PRESS

Whole No. 2200.—VOLUME LXXXV.
Number 12.

SAN FRANCISCO, CAL., SATURDAY, SEPTEMBER 20, 1902.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

La Cananea, Sonora, Mexico.

Much has appeared herein concerning La Cananea and the great region to which its success is now attracting deserved attention. There is prospect of great mineral development in that district, capital finding good opportunity for investment. La Cananea has 10,000 people. A company has acquired the Cananea Copper Co.'s railway from the town of La

Cananea to Naco, Sonora, Mexico, and the intent now is to extend it to the Yaqui Copper Co.'s properties at Campo Santo Nino, the coal deposits of La Barranca, through Sahuaripa and Alamos districts to the town of Alamos, thence into the State of Sinaloa to a gulf harbor.

The illustrations herewith are of outside workings at the La Cananea smelter. There are seven hot blast copper matte furnaces, total daily capacity 2500 tons ore, at the Cananea plant. The furnaces are rectangular, the longest, 42x210 inches, smelting 400 tons of ore per day. Each furnace rests on from eight to twelve jacks, with bed and fire castings supporting the firebrick hearth. The water-jackets are 6 inches thick, built in vertical sections, flange-bolted and held by backstays. Unlike the Bisbee, Arizona, furnaces, from which matte and slag are drawn together into settling wells, there are two tap holes, the slag being drawn at one end. The blast, after being heated in its passage down the upper walls of the furnaces, is admitted into tuyeres, tubes 5 inches in diameter, under a pressure of two pounds per square inch. Over all is the big chamber in which the fine dust carried by the ascending column of hot gases is

detained until it can fall back and be smelted. This is designed to dispense with the dust chambers, etc., as employed at Bisbee and Jerome.

Each charge is 2000 pounds of ore with about 10% of fuel. The matte when cool is cracked up with sledges and passed through crushers. Each day's output constitutes a lot, the sampling of which is a task. It is heaped, spread and quartered three times. The residue is then ground and the quartering continued until only a handful remains for the assayer. At the furnaces a five-converter plant is being put in, designed by G. Mitchell, general manager at Cananea.

The new converters are of the barrel type, 8 feet diameter, 8 feet 6 inches long. Around each rod is a ninety-pound rail, resting on two supporting wheels. The converter is canted up and down by a hydraulic pump, whose piston rod is toothed and engages a pinion on the

converter. The stroke of the piston is nearly sufficient to give a complete revolution of the pinion and matte.

A Type of Gallows-Frame.

Considerable has appeared herein regarding construction of shaft head gear, illustrated by examples of California, Montana and Colorado styles and types. The subject is an interesting one.

Herewith is a halftone of the head gear just built at the River Hill mine, near Hayden Hill, Lassen county, Cal., from a photograph kindly furnished by Mr. E. H. Benjamin, who has been in active superintendency of the development work. Regarding the entire matter Mr. Benjamin says:

"There is not much to say about this simple construction, and nothing of any importance is claimed for it, except that the design is original, and found to be entirely satisfactory in every way. It takes less timber than the four-post gallows-frame, and in my judgment is exactly as strong and efficient.

"The rock breaker and ore bin are entirely separate from the main gallows-frame, the rock breaker being driven by a wire rope from an engine in the hoisting building. The shaft over which this gallows-frame rests is a three-compartment shaft, the two outside compartments being 4x4 feet in the clear, and the center compartment is 2½x4 feet. The two center posts in the shaft frame adds strength where strength is needed, and the center compartment is used as a ladder way and for air and water pipes. We have found that a most convenient system of timbering."

BRIQUETTES of coal waste are now common. There is, however, a further advance—the manufacture of petroleum briquettes, which in some ways obviate the few disadvantages ascribed to the ordinary briquette. This newest form of fuel is composed of 97% petroleum and 3% of hydro-carbon. The volume being equal, it weighs only half as much as coal and gives but 3% residue; produces no slag; does not run when lighted; keeps its form like coal; burns without odor and without smoke; can be wetted with impunity, losing none of its properties; consumes without explosion or sparks, yet with a bright and long flame, and can be kept indefinitely without deterioration. Refined petroleum is used in their test manufacture at St. Etienne, France.

What Constitutes a Mine; May Lundy Gold Mine, 163. Hoisting Engine at Oliver Iron Co.'s Mine, Ely, Minn.; Con. Mercur G. M. Co., Mercur, Utah, 164. Mining and Metallurgical Patents, 165. Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Obituary; Catalogues Received, 170.

FROM the farthest north our Nome and Dawson correspondents send extremely different reports. Dawson is declining and its glory has departed. Nome is flourishing. Water was needed to make that camp a go, and it has it this season in plenty. The system is a practical replica of the California hydraulic system and is working well. Nome expects to show an aggregate gold output of \$7,000,000 this year.

SOME TIME ago was published herein a diagram showing at a glance the loss of head by friction of water in pipes. Its value was instantly shown by its reproduction in various technical journals and its use in catalogues and trade treatises. In this issue appears a similar diagram on "Compressed Air Transmission," prepared by the author of the first one referred to, Mr. D. E. Bigelow of San Francisco, Cal. The saving of time to busy men by the existence of such diagrams is manifest to every busy man, and the calculations and figures throughout may be relied on as being accurate.

THE change in industrial conditions on the Pacific coast is illustrated by the fact that to September 1 171 San Francisco concerns have changed from coal to fuel oil for use in their steam plants, and over 1000 others in the State of California outside the city of San Francisco have done the same. The thing figures down to a brief business basis. Steam coal has all along brought at least \$6 per ton, delivered. Four barrels of oil equal one ton of coal for steam purposes. Oil is delivered in San Francisco for 55 cents per barrel. California's present annual consumption of crude oil is about 12,000,000 barrels.

MEMORIES of the mineral land bill are recalled by the present wholesale grabbing of mineral land by timber land speculators, thus diminishing the area of public land and shutting out the prospector, in numerous cases the tracts thus secured including mining locations by bona fide miners and prospectors on which assessment work is pending. In such action the spirit of the law is violated. The Act of June 3, 1878, makes it mandatory for those taking up timber land under its provisions to make oath that the land is valuable only for timber, but it is plainly shown that in a number of cases the tracts now being segregated are taken solely because of their manifest mineral wealth. Then, too, much of this land is being taken for large corporations by dummy entries—men furnished with money to pay for 160-acre tracts, to be subsequently transferred to their employers. The result is plainly injurious to the miner and prospector, and the attention of the Federal Land Department is directed to this flagrant violation and evasion of law.

U. S. Gold Production.

The slight drop in this country's gold production in 1901, as compared with that of 1900, is the subject of considerable comment, and in some cases the relief has been expressed that high water mark now has been reached.

Gold production has fluctuated considerably. The output for fourteen different years, averaging along since 1848, is given as follows:

1848.....	\$10,000,000	1878.....	\$51,200,000
1853.....	65,000,000	1883.....	30,000,000
1862.....	39,000,000	1886.....	35,000,000
1866.....	53,500,000	1898.....	64,463,000
1868.....	48,000,000	1899.....	71,053,000
1870.....	50,000,000	1900.....	79,171,000
1875.....	33,400,000	1901.....	78,666,700

(Of course it is understood that the great jump between 1848 and 1853 was due to the discovery of gold in California). It is interesting to note that none of the years from 1853 to 1898 showed an aggregate gold output equaling that of the former year. The reason is not hard to find. Up to 1894 the high price and low cost of silver made that metal more sought after. Since then the demand for gold and the cheaper chemical processes of its production created a rapidly increasing production.

The slight difference of half a million dollars between the 1900 and 1901 gold production is of no significance, as that might have been caused in any one of the gold producing States by local conditions. Says an Eastern writer:

Of all results of activity gold is the soonest put to use, for the reason that it is the one that will give the quickest returns. Grain may be stored in bins or held in elevators and manufactures may be piled up in warehouses until consumers are found. But the consumer is always demanding gold and it gets to work, so to say, as soon as it is harvested in the refinery. It is besides practically indestructible and is used continuously. These things give the larger production of recent years not only credit for much of the prosperity they have known, but have an important bearing upon the future of business. It is probably the case that newly produced gold finds its way into business quicker in this country than in any other, owing to the gold fields being nearer the centers of finance and the machinery for its conversion into forms of use being more perfect than elsewhere. Its ordinary effect is by increasing permanent capacity to lower rates of interest and by lowering rates of interest to make the desire for means of employing capital more keen. It so keeps going the whole process known as "business." Judged by this rule, the large output must have done much in the past three years and has still capacity for doing more in the years to come.

In this regard is deemed of interest some recent remarks on this subject by Waldemar Lindgren of the U. S. Geological Survey, who in a paper on "The Gold Production of North America, its Geological Derivation and Probable Future," read by him before the recent session of the Mining Congress at Butte, Mont., in a comprehensive way cited the different geologic ages and their effect upon gold production on this northern half of the American continent. He brought out prominently the fact that on the Pacific coast most of the gold produced had been obtained from placers, and said: "If no further great discoveries are made in this region our knowledge of placers forces us to the belief that this last figure (the production from the Yukon and Alaska) will rapidly decrease. Even if the placers gradually decline in the northernmost territories it is believed that increased quartz mining will to some degree compensate for this; but the quartz mines have usually in the older districts yielded less than the corresponding placers. California's output will doubtless be maintained at about the present figure for many years."

In Utah, Idaho, Colorado and Montana, he instances that gold production is closely associated with the silver and copper industry, and he says: "The effect is perhaps to make it more stable. According to past experience no wonderful increase of production may be expected, but rather, perhaps, a gradual increase. Placer mining, with its dwindling tendency, is almost eliminated in the consideration of this belt."

Discussing another class of gold-bearing veins of a prophyllitic character, in more particular reference to Mexico, Arizona, New Mexico and portions of Colorado, Mr. Lindgren ventures the opinion that throughout that region the gold output will continue to increase. He says: "The output of the pre-Cam-

brian veins will probably continue steady for many years. Owing to gradual exhaustion of Northern placers (if no new important finds are made) the output from the Pacific Cretaceous belt will probably decrease. California may be expected to hold her own for many years, and increase is probable in Idaho and Oregon. The central Cretaceous veins may be expected to hold their own, except if for some reason the copper and silver industries should decline.

"Regarding the output from the prophyllitic veins in the United States a decrease is probable if no new discoveries are made."

THE current number of Engineering News cites the fact that the former maximum height of 70 to 80 feet attained by earth dams has of late been exceeded, and mentions, among others, four in California considerably exceeding that height, one, the San Leandro dam, of the water works of Oakland, Cal., 121 feet, and projected for an ultimate height of 175 feet above the natural surface. It is to be further noted that the latter structure was built by Anthony Chahot, a hydraulic miner, and that the sluicing method was largely employed. Schuyler, in his work on reservoirs, says of the dam: "The water was brought 4 miles in a ditch, and the sluiced materials were conveyed in a flume lined with sheet iron plates and laid on a grade of 4% to 6%. The water used was 10 to 15 sec. ft., and the ground sluicing method was alone employed, as it was not convenient to get water under pressure. The cost was estimated at one-fourth to one-fifth that of putting the earth in place with carts or scrapers." The Engineering News, in commenting on the subject, says that these high earth structures "may be considered as forerunners of the bold work in long distance electrical transmission, which is making the Pacific Coast notable in these later days."

THE old time inventor of popular fancy is passing. The frenzied, impractical genius, with his eye fixed on futurity, and disregarding the bread-and-butter requirements of the present, is obsolescent. The man who evolves brilliant ideas as one divinely inspired, and invents as easily as some men eat, is out of date. Great inventions now come from systematic study and clear, continued thought. (As a matter of fact, they always did.) It is now the custom in great establishments to have an inventor, as one would have a manager or cashier. He is a part of a modern manufacturing plant. It is his business to invent. He is educated to think, observe, compare, create and cleverly use intelligence, aptitude and energy. He keeps in touch with the present state of the art and is abreast of the times in all improvements in his line. The dreamer, the man with seven golden-haired daughters who patiently await bread while their gifted father breaks the furniture for fuel to perfect his invention, no longer exists off the stage. The new inventor is told what is wanted and thinks it out. Indeed, a good many of us are inventors without knowing it.

THE action of the Cœur d'Alene lead miners is the only logical outcome of the present situation in western lead mining. The thing is whittling down to the point whether the smelting combination must own the mines as a part of their general business or the miners themselves own and operate their own reduction plants as part of their general business. The business whatever it is or whoever has it must be run on business principles and in accordance with the rules of the game. The way the game has been played by the smelter trust during the past two years in Colorado and Idaho makes it impossible of continuance.

IRON and steel statistics show some interesting facts. Comparing the figures for 1890 and 1900 of that branch of the country's mining industry, it is noted that in the latter year there was \$176,000,000 more capital invested than in 1890. In 1900 there were 50,000 more wage earners than in 1890, and they earned \$31,000,000 more. The gross tons of product in 1900 showed an increase of 80% over that of 1890, while that last decade showed an increase of 150.7% over the preceding decade. The price per ton of the total product was \$63.49 in 1870; \$45.70 in 1880; \$29.43 in 1890; and \$27.24 in 1900.

Concentrates

THERE is no law to prevent men from any country obtaining work in Canada.

WITH a 400 H. P. duplex first-motion winding engine 150 revolutions per minute, efficiency 70%, load upon the rope two tons, the diameter of the drum should be 5 feet.

AN iron ore assaying 35% metallic iron and 5% chromium would not be of augmented value because of the chromium carried. It would involve increased expense in smelting the ore.

IT is probable that were the figures obtainable it would be found that, in Western metal mines, there are 500,000,000 tons water annually raised, which, estimating at a cost of 2½ cents per ton, is an aggregate annual expense of \$12,500,000.

"CONCENTRATES" knows no exact rule by which to calculate the bursting pressure of a gauge glass, this is largely due to varying dimensions and difference in tensile strength. The bursting pressure ranges from 400 to 800 pounds per square inch.

A 1000 H. P. direct-connected gas engine has been in constant use at Lancaster, Ohio, for the past eighteen months. A 300 H. P. gas engine built by the Union Gas Engine Co. of San Francisco, is the largest of the kind yet built on the Pacific coast.

TO SLUICE tailings from tanks will take from 300 to 450 gallons water per ton of ore. A stream of 375 gallons per minute under 140 pounds pressure through a ¾-inch nozzle will sluice 30-mesh tailings from circular tanks at the rate of sixty tons per hour.

A CYLINDER STEAM BOILER 36 feet long, 36 inches diameter, eighty pounds steam pressure, would have about 12½ H. P., but exact data could be given only by knowing the weight of water evaporated per hour and the temperature of the feed water.

THE illumination from a gas jet is not proportional to the gas consumption. A gas burner will give its normal light, say 16 candle power, when it is burning perhaps 5 cubic feet per hour, and will give very little more light if the pressure be increased to 7 or 8 feet.

THE August electrical display of street lighting in San Francisco, Cal., involved the placing and nightly lighting of 30,000 incandescent electric lights. The work cost \$10,235. The lighting cost \$1.19 per 100 lights per night. In both cases the amount named was the actual cost to those who did the work.

THE best way to get a correct assay is to get a battery sample, a sample from the powdered mixture of the general product. A carload coming up from the mine does not represent the vein of ore; a handful from each car does not represent the contents of the car; the part taken from these samples for assay tests is not representative.

IN the case of Tuolumne Con. M. Co. vs. Maier (Cal.) 66 Pac. Rept. 863, the court held that: "Any rights acquired by a discovery of mineral on a mining claim subsequent to the construction of a ditch across the claim by a third person are subject to the easement of the ditch, and to its owners' rights as a prior appropriator."

WHEN a ship is sailing at a uniform speed the force exerted on it by the wind causes no change in its motion, but simply prevents such a change being produced by the resistance of the water; or, when a railway train is running with uniform velocity, the force of the engine does not change, but only maintains its motion in opposition to the forces, such as friction and the resistance of the air, which tend to destroy it.

THE requisite assessment work for a group of contiguous or adjoining claims can be done on any one of them if the work on the claims thus associated can be shown to be beneficial to all—that is, it must manifestly tend to the development of all the claims in the group. The aggregate amount of the expenditure of money or labor on one claim for this annual assessment must equal in value that which would be required on all the claims if they were not adjoining or if under separate ownership.

MINING ENGINEERS in their professional papers on technical subjects, as read at gatherings and published in trade journals, are more apt to give cost figures, prices of work, etc., than either mechanical or electrical engineers. Costs and prices are among the vitally important points of detailed information and it is the custom for mining engineers to be minute in their cost specifications. It is not designed reticence on the part of others that causes the omission. It is largely a matter of custom and precedent.

THE pressure on any perpendicular exposed surface occasioned by wind can be figured in pounds. The square of the velocity in miles per hour $\times .005$ = the pressure in pounds by square foot; so that a wall 15 feet wide and 20 feet high would have a total pressure against it produced by a 40-mile wind of 2400 pounds. Conversely, the velocity of wind can be figured from the observed pressure by the formula $\sqrt{200 \times \text{pressure in pounds per square foot}}$. For instance, a wind pressure of 8 pounds per square foot would show $200 \times 8 = \sqrt{1600} = 40$ miles per hour.

THE tables, formulae and figures under the head of "useful information" in mining machinery catalogues

are usually made up by competent men in the employ of the concern issuing the catalogue, and are generally correct. It is possible in the case referred to by our South Dakota enquirer that there is a slight discrepancy, and, doubtless, if the firm publishing the catalogue had its attention directed to the assumed error, the calculation (if a mistaken one) would be corrected in future editions. It is to be noted that the term "gallon" is by itself indefinite, as it may be the equivalent of 231 cubic inches, or 268.8 cubic inches, according to the kind of "gallon" it is. There is a necessary "correction factor" in a good many engineering calculations. It is sometimes better not to know so many things than to know so many things that are not so.

THE U. S. mining statutes make no mention of Sunday, and only require a certain amount of work to be done, therefore Sunday work done is as good as work done on any other day. It has been decided that work done on a claim to the extent required by statute holds the claim, regardless of the minority of the locator. The discoverer of a lode may, so far as the U. S. statutes are concerned, hold as many claims on the same lode as he can do the assessment work on. Sometimes district mining laws give the original discoverer the first choice of two or more claims, and all others one each, and in such cases the district laws are recognized by the courts, being in the nature of an agreement by interested parties. In no case can any one claim exceed the statutory limit—1500x600 feet.

WHEN a boiler plant is lower than the buildings which it supplies, the course of the live steam is generally up the hill, and the tendency of the water carried into or formed in the pipes is to move in a direction contrary to the flow of the steam. If the boilers were on the hill, the flow of steam would be down hill and flow of the water would be in the same direction as the steam flow. With a hill plant, the chimney could be carried considerably above the surrounding buildings. With regard to carrying the condensation from the buildings to the central station, it makes little difference where the station is; the power to send the water back must be at the point where the condensation takes place. Usually the water must gravitate at the lowest point in a building and be taken by pumps and sent up the hill, if there is one.

IRON ORE is now reduced to a metallic state in the blast furnace. A huge cylinder set on end, into the top of which ore, fuel and flux are dumped, while air is forced in near the base by blowing engines. A modern blast furnace requires about a ton of coke per ton of pig iron produced, the quantity varying, of course, with the efficiency of the furnace plant, the composition of the ore, and many other factors. Of all the heat generated by the combustion of the coke, about one-quarter is expended in reducing the iron ore from the form of an oxide to a metallic state. It must be understood that the union of oxygen with iron produces heat, just as does the union of oxygen with coal or with hydrogen gas; and the heat produced is a fixed and definite quantity for a given weight of iron. When the iron and the oxygen are forced apart, heat is absorbed, and just the same amount of heat that was liberated by their union. The heat required to reduce a pound of metallic iron from its ore amounts to 3396 heat units.

A COLD CHISEL for heavy chipping should be sharpened slightly oval or rounding. A tool sharpened thus will stand harder usage than when the cutting edge is concave, or even straight. The reason for this is based upon the strength of the arch. The engineer builds a dam across a stream in the shape of a curve for the same reason, and both the engineer and the beaver, in his native stream, obeys the same law in regard to this matter. Aside from the principle of the arch, there is less danger of breaking the corners off of a chisel when the edge is curved, for then the force of the blow is supported in a brace-like manner by the metal in the curved corners, whereas in the concave point the same bracing action, applied in the opposite direction, tends to split off the corners of the tool. The matter is so simple that every machinist should take advantage of it to add strength and durability to his tools. The same shape can be given to screwdrivers when they are to be used in chucks on work like that of putting screws in shoemakers' lasts. Thousands of screws are thus put in, and it is found that if the end of the screwdriver is rounded off the least possible amount it is much easier to make the tool bit engage the slot in the screw. When the bit is the least amount of concave on the end it is impossible to make the screwdriver take hold when running even at a low working speed. Make the end of the tool convex one-thirty-second of an inch, and the speed at which the tool can be put into a screw slot will be doubled.

HOWEVER carefully the ore may be treated, a certain portion of gold remains in the tailings, varying, other things being equal, according to the character of the ore. In case this results, in part, from the presence of particles too large to be entirely dissolved, that portion can be extracted by re-treatment, either with gas, by chlorine water, or by amalgamation. But a portion, which is sometimes quite considerable, still remains, and resists every mode of chlorination or amalgamation, and can only be extracted by smelting with lead. In general, it may be said that gold which can be seen by the aid of a lens, after finely grinding, and carefully washing a sample of the tailings, can be extracted by chlorination or amalgamation; but that which cannot thus be rendered visible can neither be chlorinated nor amalga-

mated, even if the ore be re-roasted, with or without re-grinding. (If re-ground, it forms a pasty mass which cannot be leached, being almost impervious to water.) Of course, the ore is supposed to be properly roasted in the first instance. Concentrated sulphides containing gold, and free from lead, will frequently yield as much as 98% of the fire assay, if moderately rich, but the extraction of 95% is considered a good result, from ore containing \$100 worth of gold in a ton. As the material loses about 24% of its weight in the roasting and leaching, it will readily be perceived that, if there has been no sensible loss of gold in the roasting, the tailings from such ore will assay about \$6 per ton, and for every 100 tons of ore treated there will be 76 tons of tailings, containing \$456 worth of gold. Tailings of this character, consisting chiefly of iron peroxide, make an excellent flux for the smelting of galena. All the precious metal they contain is extracted, together with the lead set free from the galena by the action of the iron oxide, and may be considered as of profit to the smelter, who is obliged to use some kind of iron flux, and can find nothing, unless it be metallic iron, better adapted to his purpose than these tailings.

THE American Society of Mechanical Engineers charges for annual dues \$25 for members, \$15 for juniors. The American Society of Civil Engineers charges \$15 annual dues for members and associate members and \$10 for associates and juniors. The American Institute of Electrical Engineers charges \$10 per year for members and associates. The American Institute of Mining Engineers' charges are \$10 per year for members and associates. The California Miners' Association has charged \$1 per year for members, \$5 per year for members living in any of the counties that border on San Francisco bay. In all the organizations mentioned and in all other of similar character it is generally understood that the revenues run the concern and are used solely for that purpose. As a general thing officers and members of such organizations gladly give expert services for the good of the cause, services that if paid for at their worth would bankrupt the society's treasury. So far as "Concentrates" knows none of these organizations are incorporated. The three that he belongs to are not. There are reasons why such technical associations should be incorporated, and weightier reasons why they should not. One reason against incorporation is that should membership in the organization be necessary to the members of that profession an incorporated association would have no legal right to exclude applicants for membership because of personal reasons; this latter right is prescriptively conceded to voluntary associates, though seldom exercised.

TO CALCULATE the working energy that a given volume of water under a given head or fall is capable of producing, is determined by the weight and velocity of the water. The weight is an unvarying factor, a given quantity always weighing the same, but the velocity varies according to the height of column or head. The initial velocity of spouting fluids is directly as the square roots of the heights of the columns, or of the pressure, the initial velocity under a 4-foot head being 16.2 feet per second, and, the square root of 4 (2); to ascertain the spouting velocity of any other height, take its square root, divide it by 2, the square root of the 4-foot head, and multiply it by 16.2, the spouting velocity of the 4-foot head. With a head 16 feet high the square root is 4; divide by the square root of 4, which is 2, multiply by 16.2, and, as a result, we have 32.4, which equals the spouting velocity due to a 16-foot head of water. By the same rule is found that the spouting velocity due to a head 64 feet high is 64.8, for the square root of 64 is four times greater than the square root of 4, therefore the velocity must be four times greater than the velocity due to the 4-foot head. The initial spouting velocity of any other head of water can be ascertained by the same method of calculation. Measured by spouting velocity alone, it would appear that there is a relative loss of power as the height of the column of water increases. A 64-foot head is sixteen times the height of a 4-foot head, and yet the spouting velocity of the former is but four times greater than the latter. It must be remembered, however, that while the spouting velocity has been increased but fourfold, the pressure has been increased sixteenfold, so that against, say, one velocity and one pressure in the 4-foot head, there is in the 64-foot head four velocities and sixteen pressures, which means great increase in power, instead of a relative decrease. Thus a water wheel which would develop 2 H. P. under a 4-foot head, would develop 128 H. P. under a 64-foot head. Thus it will be seen that by raising the head sixteen times the power is increased sixty-four times. It is due, however, to say that, while theoretically the power is increased sixty-four times, the efficiency of the wheel under the high head is not in so great a proportion, on account of increased friction due to its greater speed. The speed of a wheel increases with the velocity of the water, therefore the speed of a wheel under a 64-foot head would be four times greater than it would be under a 4-foot head. This brings up another phase of the subject. While the 64-foot head develops four times as much power as the 4-foot head, four times as much water is consumed in doing it. When a given quantity of water is consumed in both cases, the power of the 64-foot head is but sixteen times that of the 4-foot head, or in exact ratio to the heights of the head. That is: A given quantity of water in a 64-foot head will develop sixteen times the power that it would in a 4-foot head, because the former head equals sixteen times the height of the water.

Line Timbering by the Square Set System at Rossland, B. C.*

By BERNARD McDONALD.

In mining operations, when the ore extracted exceeds a width of 10 or 15 feet, it has been found that the cheapest and only effective method of timbering is by the square set system.

The system may be generally described as a rectangular skeleton framework of timbers, extending from wall to wall of the vein as exhausted, the different members of which are so framed as to stiffen and support each other, and equalize and distribute local strains after the manner of a truss.

The invention of the square set system of timbering was made by Philip Deidesheimer, while superintendent of the Ophir mine, on the Comstock Lode, in 1860.

In Monograph IV of the United States Geological Survey, "Comstock Mining and Miners," the following reference is made, which will be found interesting under this heading:

"At the 50-foot level (of the Ophir mine) the vein of black sulphurets was only 3 or 4 feet thick, and could readily be extracted through a drift along its line, propping up the walls and roof when necessary, by simple up-rights and caps. As the ledge descended, the sulphuret vein grew broader until at a depth of 175 feet it was 65 feet in width, and the miners were at a loss how to proceed, for the ore was so soft and crumbling that pillars could not be left to support the roof. They spliced timber together to hold up the caving ground, but these jointed props were too weak and illy supported to stand the pressure upon them, and were constantly broken and thrown out of place. The dilemma was a curious one. Surrounded by riches, they were unable to carry them off.

"The company was at a loss what to do, but finally secured the services of Philip Deidesheimer of Georgetown, California, who visited and inspected the treasure-lined slopes of the Ophir."

During Mr. Deidesheimer's engagement at the Ophir, all the principles of square set timbering were evolved, under his immediate supervision, and the wide and rich ore bodies occurring in that mine were successfully extracted without the loss of ore or injury from caving by the use of this system. The system was then used in all the mines on the

NOTE.—This "Plate" to accompany paper entitled "Line Timbering by the Square Set System," written by BERNARD McDONALD ROSSLAND, B. C.

MINING AND SCIENTIFIC PRESS.

* Read at the meeting of the Canadian Min. Inst., Sept. 10, 1902.

Comstock Lode, and subsequently, in all metalliferous mines elsewhere where the ore bodies exceed a width of 15 feet, the extreme width that is practical to timber by stalling.

The "square set" has undergone numerous modifications of detail in dimensions and the framing of its members in the various camps where it has been since used, owing mainly to local conditions, the dip of the vein and the character of the ore bodies and the enclosing rock.

VEIN CHARACTERISTICS AT ROSSLAND.—In the Rossland mines, the ore deposits have widths ranging up to 100 feet or more, and lengths of several hundred feet along the veins. The veins are sheer zone fissures, the vein filling consisting of country rock, which is now found replaced and cemented to various degrees of completeness by auriferous pyrrhotite and chalcopyrite.

The ore and the enclosing rock may be designated as extremely hard, and the veins dip at angles of about 70°. These conditions facilitate and simplify timbering, without, however, doing away with its necessity.

PRELIMINARY WORK.—In stoping out these deposits the work is begun at the level drives or drifts run in the vein and continued upwards in steps or stopes.

The first work in opening up an ore shoot or deposit preparatory to extraction consists of running drives or drifts through it from the level stations at the shaft, which are generally cut at distances of from 100 to 200 feet in depth below each other. Such drives may happen to be run along either wall of the vein, or through the vein at any point or distance (usually varying) from either wall.

These drives are considered as random holes, made longitudinally through the vein to determine, in a general way, its course or strike, and the behavior and characteristics of the ore shoot. They serve, besides, as preliminary thoroughfares for the traffic, drainage and ventilation necessary for the preparatory work of stoping, to be hereafter described.

As generally run, the drives have widths of about 6 feet, and heights of about 8 feet, and require no timbering, owing to their comparative small size and the hardness of the vein rock.

When it is decided to begin stoping on any new level, the first work done is to excavate the ore along the drives from wall to wall of the vein, making the excavation of sufficient height to receive the "sill floor" set of timbers, as the first series of square sets on the level is called, and to leave a space of 2 or 3 feet over the set. This space serves to provide room for blocking and wedging the timbers to place, and to receive a layer of old timbers, which act as a cushion in preventing the possible breaking of the timbers by the masses of rock that must be blasted down on them as the work of stoping out the ore above proceeds.

SILL FLOOR CONSTRUCTION.—The sill floor is a framework, made of 10x10-inch sawed timbers, laid down on the working level in the ore body; they serve as the sills or foundation timbers on which the square sets are to be erected. It is, therefore, the first, as well as the most important part of the square set system of timbering.

Figure 1, plate 1, shows the sill floor as laid down and ready to receive the "sill floor set" of timbers. The members of the sill floor consist of three pieces, the stringer or long sill, the spreader or short sill, and the hutt spreader or brace. These members, when repeatedly laid in duplicate, will make up a sill floor to any extent required by the size of the deposit.

The dimensions and details of the framing of these members are shown on the plate.

The long sill measures 15 feet over all, and is framed from a 16 foot timber, which allows 6 inches to be cut from either end to square the piece and remove sun cracks.

The short sill, as framed, measures 5 feet 4 inches in length, over all, three of which may be cut from a 16-foot timber, if it overmeasured a few inches, as it generally does, and the ends are sound.

The hutt sill or brace is framed of varying lengths, to suit the existing space, which generally varies owing to local bulgings or contractions of the vein. It is framed on one end exactly like the short sill, while the other is cut square or beveled to fit or hutt against the wall rock, from which it is wedged tightly to place against the long sills.

A description of the method of framing the sill floor set of timbers is not needed, as it will be fully comprehended by a glance at the figures on the plate.

In laying the sill floor the long sills are set ends abutting flush against each other and as nearly as possible parallel with the general strike of the vein, ignoring any local bulging of the walls.

The first sill is laid close and approximately parallel to the foot wall, in which position it is leveled and held by blocking or hutt braces; the other long sills are laid paralleling this one at proper distances apart, that is, 5 feet 4 inches between centers. The cross sills fit on top of these, lying level with them, the ends being halved in framing to rest into similar halvings in the long sills, and to abutt flush against each other and extend endwise from wall to wall of the vein.

When the long sills reach as near the hanging wall

of the vein as desirable they are braced from it by the hutt spreaders or by blocking wedged tightly to bring all the members into proper position. The philosophy of this design of the sill floor is as follows:

The long sill is made 15 feet in length, so as to better sustain the superstructure of square sets erected on it when the ore upon which it rests comes to be stoped away. For instance, when the ore is being blasted from under the sill floor by the work of stoping, coming from the level below, and the blasting tears away a portion of the ore upon which the sill floor rests, making an opening, as it generally does, of, say, 8x8 feet, the long sills would overreach such opening, and one or both ends would rest on the solid rock beyond. Nor would the short sills drop away through such opening, owing to the fact that they rest on top of the long sills, as previously described and shown on the plate.

Through the opening thus made in the ore, the portion of the sill floor exposed would be supported by posts set on the timber sets in the stope below. Thus the long sill operates to allow the work of stoping out the ore upon which the sill floor rests to be safely conducted if such portions of the sill floor as become exposed as the work proceeds are properly supported by posts from the timber work underneath.

TIMBERS AND METHODS USED AFTER SILL FLOOR IS LAID.—The first tier of square sets erected on the sill floor is known as the "sill floor sets." The assemblage of the framed timbers into square sets then proceeds upwards, by floors, set over set, vertically, *pari passu* as the work of stoping exhausts the vein. The timber structure over any level is referred to in subdivisions as the "sill floor sets," "first floor sets," "second floor sets," and so on until it reaches the level above and catches up and supports the sill floor on that level.

This method of reference to the timbering as it advances carries with it the data for a general calculation of the portion of the vein exhausted over a level, as each set of timbers in place indicates that 9 feet vertically and 5½ feet horizontally of the vein is exhausted, 9 feet being the hare height and 5½ feet the width of space required for a set of timbers. Each square set in place indicates that twenty-four tons of vein has been extracted.

Aside from the sill floor, all the timbers employed in the square set system, except the planks for floorings and chutes, are framed from round logs. These logs are preferably of red fir, it being the strongest native timber, but pine, spruce and tamarack may be used. When cut in the woods, the logs are peeled and allowed to season for a period of from six to twelve months, during which time they lose about one-third of their green weight, which is a very important advantage in subsequent handling. In diameter they range from 12 to 20 inches, but generally average about 16 inches, and are sawed in lengths of 16 feet 6 inches.

The logs may be framed by hand or with machine saws into the various members of the square set, as follows, viz: posts, caps, girts or braces, and hutt caps. Like the members of the sill floor, these members may be duplicated to any extent required by the size of the excavation to be timbered.

The posts as framed are 8 feet 2 inches over all; the caps are 5 feet 4 inches, and the girts or braces are 5 feet; the hutt caps, like the hutt spreaders, of the sill floor are cut in varying lengths to suit such spaces as may exist.

The details of framing the logs into members of the square set are plainly shown in figures on plate 1, and need no further description. The philosophy of this method of framing the timbers is that the cap pieces of the various sets form continuous stringers of timber running horizontally from wall to wall of the vein, no matter what this distance may be. Such stringers offer the end grain or greatest strength of the timbers to the walls, from which the greatest strains are generated.

The posts and girts rigidly support the stringers thus formed of the several cap pieces in true horizontal position, bearing on the joints from right-angled directions, while the cap pieces and the girts support the posts in true vertical position.

The whole framework forms a strong rigid structure capable of indefinite extension upwards and longitudinally as stoping proceeds, allowing at the same time for any expansion and contraction in width to suit such irregular widths of the vein as may occur.

Besides the function of the various members of the square set system to support each other in the manner described, that of the cap pieces is to receive directly and sustain the strains coming from the walls of the exhausted deposit, while that of the posts is to support the vertical weight coming from the undercut ore deposit and the broken ore lying on the floors, but strains coming from any direction are distributed over all the members of the set.

The system possesses, to a considerable degree, the qualities of a truss, and makes it possible to extract all the ore of any deposit and effectually secure the enclosing walls from caving in. When the framework comprising the sets is erected, a floor, consisting of 3-inch plank, is spiked down on the caps of each floor set. These are the working floors on which the miners operate the machine drills, in the method shown on Fig. 5. When the ore is dislodged from the vein by blasting, it falls on these floors, where the waste or second-class ore may be sorted

out from the shipping ore. The shipping ore is shovelled into chutes, which are built of 4-inch plank spiked to the timber framework and carried upwards with the square sets, as shown in the plate. The second-class ore, or waste sorted out, may be stored temporarily or permanently in the framework of the timbering, from whence it may be drawn off at any time through chutes, should removal elsewhere be desired.

Figs. 4 and 5 are ideal cross and longitudinal sections illustrating the method of timbering and the work of stoping as it is carried on between the levels. Fig. 4 is a cross-section through the line A-B on Fig. 5, which in turn represents the longitudinal section through the line C-D on Fig. 4. On Fig. 4, the original position of the level drive in the vein is assumed as shown at the point X. This drive, as already stated, furnishes the point from which the excavation of the vein matter for the sill floor is commenced.

The step method of excavating the ore is shown on Fig. 5, where stoping is proceeding in double-headed steps, each step excavating the ore from wall to wall and having a vertical height of 9 feet in the clear, which allows the erection of one floor of timber sets, which in turn provides the scaffolding from which the miners may attack the ore above.

In stoping out the ore on any level, the ordinary method is to keep the sill floor at least 30 feet in advance of the first floor, and it about 30 feet in advance of the second, and so on, as is shown in Fig. 5. One machine drill, or generally two, in case the vein is wide, are assigned to the work of the two opposite headings of any floor, going in opposite directions, working on each heading alternately. When one face is drilled and blasted, the machine drills are changed to the opposite face, and the shovellers pass the broken rock into the chutes, or sort it, if sorting is required. When the ore broken is thus removed from the face, the timber gang erects another unit of timber there, and the stope is again in readiness for the machine drills, which have by this time finished drilling on the opposite face.

Generally, the step method of stoping proceeds in opposite directions from a raise, run through the ore body between the levels, as shown in Fig. 4. The framed timbers are delivered in the stope by dropping them down through this raise or hoisting them from the level. Sometimes the framed ends of the timbers are injured by dropping them through the raise, but, as a rule, no material injury is done to them, while the time gained by this method is a very important factor in cheapening the cost of timbering, compared with hoisting piece by piece from the sill floors underneath.

PER TONNAGE COST OF SQUARE SET TIMBERING.—After the sill floor is laid and the framework started, a square set, which is made up of one post, one cap and the brace, consumes 18½ running feet of logs.

The logs, peeled and seasoned, cut measuring 16 feet 6 inches, cost \$1.20 each delivered f. o. b. the cars at the works, or about 8 cents per running foot. Therefore, the 18 feet 6 inches required for the set would cost \$1.48, or, say, \$1.50 unloaded, in the framing shed, provided the logs are not cut to waste in framing, which may be avoided with a little care and foresight.

The cost of framing the pieces comprising the set would be about \$0.55 per set, when framed by hand labor, carpenters being paid \$3.50 per day of nine hours.

COST DATA PER SQUARE SET, HAND FRAMED.—**MATERIAL.**—A log measuring 16 feet 6 inches, costing \$1.20, cuts into two posts, or three caps, or three braces; therefore:

Material in one post costs.....	\$0 65
Material in one cap costs.....	43
Material in one brace costs.....	40

Total cost of material in one set is, say.....\$1 50

LABOR. —One carpenter frames per day:	
About 21 posts, costing each.....	\$0 167
About 21 caps, costing each.....	167
About 16 braces, costing each.....	219

Total cost of framing.....\$0 553

Total cost of labor and material in set.....\$2 053

The details of cost of the individual members of the set, framed on the surface ready to go into the mine, are, therefore, as follows:

One post costs for.....	{ Material.....\$0 650	\$0 817
	{ Labor.....167	
One cap costs for.....	{ Material.....430	649
	{ Labor.....219	
One brace costs for.....	{ Material.....400	587
	{ Labor.....187	

Making the total cost.....\$2 053

The costs next attaching to the square set, or unit, of this method of timbering are:

Lowering into the mine, approximately.....	\$0 10
Delivering to place required, approximately.....	0 10
Labor in erecting, approximately.....	1 50
Incidental material, such as blacks, wedges, tools, nails, approximately.....	0 10
Cost of sill floor, averaged over eleven sets between levels 100 feet apart, approximately.....	0 15

Total.....\$1 95

These costs, last above given, may vary greatly,

being increased or decreased with the completeness of the facilities for handling the framed timbers, the cost of the several items as stated may vary accordingly from time to time, but the total will be about the average cost, and will closely approximate that of carefully supervised operations. Therefore, from the foregoing, it will be seen that the cost of the square set placed in the mine will come down, as follows:

Total cost of labor and material, as above.....\$2 053
Labor and material when set is in place, as above. 1 950

Total cost, say.....\$4 003

When framed by machine saws, the cost of framing a square set does not exceed 30 cents, including the cost of power, as against 55 cents by hand—a difference of 25 cents per set. Therefore, if the framing is done by machinery, the cost of a set in place would be \$3.75 as against \$4, as shown above, when the framing is done by hand work.

The per tonnage cost for timbering by this method works out as follows: The average space to be excavated for each square set is 5.3 feet wide by 5 feet long by 9 feet in height, or 240 cubic feet. The Rossland ores, being heavily impregnated with iron and copper pyrites, yield a ton of 2000 pounds for each 10 cubic feet of ore in place. Therefore, from the 240 cubic feet of vein required to be excavated for a set of timbers, the yield will be twenty-four tons. If the timbers were framed by hand, the cost of timbering, so far as described, would be about \$0.17 per ton; if by machinery, \$0.156—a difference of \$0.014 per ton in favor of the machine-framed sets.

In addition to the costs above tabulated, there still remain the costs of the chutes, floors, ladders and railings necessary for the convenience and safety of the miners and passage of ore and supplies. These require, on an average, about 100 feet of lumber, board measure, per square set, which, at \$11 per 1000 feet, would add for the lumber \$1.10, and for placing it say \$0.10, or a total of \$1.20 to each square set, which would then cost, in the case of hand framing, \$5.20, or a total cost of \$0.216 per ton of crude ore; and, in the case of machine framing, \$4.95, or a total cost of \$0.206 per ton of crude ore.

INCIDENTAL COSTS.—The cost of timbering, per ton of ore shipped, would be greater than the figures given above in proportion to the quantity of waste or second-class ore that would be sorted out from the crude ore extracted.

In the Rossland mines about 20% of the ore mined is sorted out and goes to the second-class ore dump to await profitable treatment, expected to come in the future. Deducting 20% of the 24 tons of crude ore in a square set, there would remain 19.20 tons as the shipping ore, against which the total costs of the square set, as above—\$5.20 or \$4.95, as the case might be—would have to be charged. This would raise the per tonnage costs on the ore shipped to about \$0.27 and \$0.26, respectively.

Where there is a reasonable expectation that the second-class ore will eventually pay a profit after suitable treatment, it would only be fair to charge a pro rated cost of the timbering to it, and the cost would then remain \$0.206 and \$0.216 per ton, as above.

In cases where, on account of bad ground, angle bracing, bulkheading or cribbing and filling would be required, the per tonnage cost would be still further increased, but to a comparatively small extent.

LIMITATIONS OF THE SQUARE SET.—The limit of the capacity of the square set system as already described, without any re-enforcing devices to withstand the pressure that may be exerted on it by the enclosing walls of an ore body when that ore body is extracted, may be reached.

The limit depends on the nature of the walls enclosing the deposit and the extent of the excavation. If the wall rocks are solid and do not swell on exposure to the air, and dip at a high angle, the ore body may be extracted between levels say 100 feet apart and for a length of 200 or 300 feet along the vein, and the pressure likely to be exerted by the walls will be sustained by the skeleton square set without reinforcement of any kind.

If, however, the vein dips at a low angle and the wall rocks are decomposed, or of a talcose or serpentine character and disposed to swell, the pressure that might be exerted on the timbers, when even a comparatively small excavation of the ore body has been made, may cause them to crush, "jack-knife" or collapse, allowing the wall rocks to cave in and close up the stope. When the members of the square set become squeezed out of the truly right-angled position which they should occupy, their capacity to resist wall pressure or strains from any direction is practically nil.

When, owing to wall pressure or imperfect erection of the sets, "jack-knifing" of the square sets results, the cave-in, which sooner or later will follow, with disastrous consequences, may be prevented by either bulkheading, cribbing or filling the skeleton framework of the timbers.

The cost of the foregoing methods of reinforcement which are the only practical ones that can be successfully used in bad ground, cannot be given with any general degree of accuracy, as that is so much affected by the local conditions in each case.

A general idea of what the cost is likely to be

may be gleaned from the description following:

REINFORCEMENT METHODS—ANGLE BRACING.—If, after the square sets are properly erected in place, the members manifest an inclination to swing out of the right-angled positions they originally occupied to each other, this tendency may be arrested and prevented by a system of angle bracing. This consists of placing diagonal braces made of round or square timber on the sill floor and against the foot of the posts and leaning the heads so they will fit snugly against the top of the posts underneath the caps or girts, as the case may be, of the next adjacent set. The head of this diagonal brace should lean in the direction from which the pressure comes. This method is illustrated in Figure 8.

CRIBBING.—When the square sets manifest a stronger tendency to swing than in the case above referred to, the collapse threatened may be prevented by crih work. This consists of crossing alternate layers of round or square timbers of any convenient size between the posts of the sets until the space between the sill and cap is filled, as shown in Figure 9. This crih work may extend from wall to wall through two or more rows of sets if required, and the spaces between the sets thus cribbed may be filled with waste rock, but this is called "filling," and will be referred to under that heading below.

BULKHEADING.—This method of reinforcement consists of placing timbers closely together in much the same way as the crih work above referred to, and wedging them tightly between cap and sill.

FILLING.—This method consists of filling the spaces between the members of the square set with any material such as waste rock, earth or sand. When the filling is done it is retained within proper bounds and the necessary passageways are kept open through the timbers by building crih work around them as described.

Waste rock for "filling" purposes is generally secured from the development or dead work that is being prosecuted in other sections of the mine, but where a large quantity is required it is often found necessary to mine it specially for that purpose, or drawn from the waste dumps on the surface. About 8 cubic yards of material is required to fill the vacant space of the frame of a square set, and the cost of such filling will be the cost of obtaining and placing such material, together with the crih work required to retain it within proper bounds.

GENERAL REMARKS.—The square set system of timbering is used successfully and exclusively in all mines where large deposits of metalliferous ores occur.

Where favorable conditions, such as railway transportation and a moderate supply of timber, exist, it is comparatively cheap. If care is taken in the construction of this system in the mine, it ensures that all the ore existing may be extracted without injury to the workmen or the mine. Round logs or sawed timbers of any dimension, ranging from 8" upward, may be used, but the sizes are governed by the economic conditions and the mining requirements.

In the mines of Rossland the round logs or timbers used for the square sets cost \$1.20 for each log 16.5 feet in length f. o. b. the framing shed at the mine. These logs are cut in the State of Washington and delivered over the Spokane Falls & Northern Railway on flat cars, over distances ranging from 45 to 75 miles, each flat car being loaded on an average with sixty logs. The unloading at the framing shed is done in a few minutes by cutting off the retaining standards on the flat cars and allowing the logs to roll off on the storage platform.

Of course, where wagon transportation is required from the railway terminus the expense will be correspondingly increased.

In every mining camp there will be more or less variation in the method of framing and in the cost of the square sets in place, also the tonnage of ore to be extracted from the space occupied by each square set.

Where the dip of the vein is at a flat angle, or the walls are had, shorter posts than those described herein will probably be more advantageous; the more vertical the dip of the ore deposit the longer the posts may be, and vice versa.

Where sawed lumber is comparatively cheap, 3-inch plank is preferable to lagging poles for floors, on account of the greater floors it offers for shoveling, and the fact that it may be removed and reused.

Production of Borax.

The report on "The Production of Borax in the United States," by Dr. Joseph Struthers, in "Mineral Resources of the United States, 1901," now in press, U. S. Geological Survey, shows that there was a slight decrease in 1901, the output being 17,887 short tons of crude borax and 5344 short tons of refined borax, valued at \$1,012,118, as compared with the production of 24,235 short tons of crude borax and 1602 short tons of refined borax in 1900. Of the output in 1901, California produced the whole of the refined borax and 16,887 tons of the crude borax.

The production of borax in the United States continues to be derived mainly from the colemanite deposits of California, although a small quantity is pro-

duced from the marsh deposits of California, Nevada and Oregon.

The imports of borax, borates and horic acid in the United States amounted to \$56,683, as compared with \$32,679 in 1900 and with \$27,047 in 1899.

The Borax Consolidated, Ltd., (the international borax combination), now operating in the United States, England, France and South America, reports a very favorable business for the fiscal year ending Sept. 30, 1901. This company is capitalized at \$1,400,000, of which \$800,000 is preferred stock carrying 5% accumulative dividends, and \$600,000 is ordinary stock, each of the par value of \$10. The net profits for the fiscal year were \$190,278, from which interim dividends of \$22,000 on preferred stock and \$30,000 on ordinary stock were paid.

There has been but little fluctuation in the price of borax during 1901, which remains at 7 to 7.25 cents for the refined and 6.75 to 7 cents for the concentrated product.

When Ice Ran Up Hill.

A scientific discovery of great interest to geologists and of practical value to mining men has been made by Prof. Atwood of the University of Chicago, who, with a party of students, is spending the summer examining the formations of the Uinta mountains of Utah. It clears up the mystery often encountered of the presence of small pockets of gold-bearing ores far removed from the main ore body.

Prof. Atwood's discovery, in brief, is that the watersheds of the present period are not identical with the icebeds of the glacial epoch, and that occasionally the great glacier of 10,000 years ago or so moved up hill with quite as much facility as it coasted down the canyons, carrying with it over the divides large hodies of debris scraped up in its path, which assisted in forming the moraines when the glacier melted.

Prof. Atwood's discovery was made in a rather peculiar manner. In the vicinity of Mount Watson, near the headwaters of the Weher river, are abundant evidences in the shape of small lakes, moraines, etc., of the presence of the great glacier at an earlier period. One side of the mountain is barren rock, scraped clean by the moving body of ice. Upon this barren surface are the scratches and indentations of the rocks carried by the glacier in its course. While examining these grooves a few days ago Prof. Atwood was startled to discover that they ran up hill instead of down. The evidence of this was fragments of rocks pulverized by the great weight and strewn along the path.

Excited by this peculiarity, the professor called his companions and they spent several hours tracing the indentations up the mountain side, and every step confirmed the theory advanced by the instructor. Prof. Atwood will publish the result of his discovery in a scientific journal. His explanation of the peculiar phenomenon is that the glacial body, gradually pushed over the divide, did not, as might have been expected, break and melt where it was, but when the ice body receded was drawn up the mountain side and back over the other side of the divide. As it moved, of course, it picked up in its path portions of the ground beneath, which became a part of the moraine when the ice melted.

The discovery may lead to a revolution in the method of prospecting. The miner who finds a detached body of gold-bearing ore will hereafter not be content with seeking the mother lode in the same canyon, but will look also on the other side of the divide, from which the detached fragment may have been drawn by the glacier. To geologists the discovery is full of interest as shedding light on the movements of great ice bodies.—Salt Lake Tribune.

Finder of Large Nugget Dead.

Samuel Hawkins Napier, who found what is said to have been the largest nugget of gold ever mined, is dead, says a Provincetown, Mass., dispatch to the New York Times. He died alone, except for the companionship of a faithful dog, 200 miles from any human habitation, in the wilds of the Gatheneau river, Canada.

He was a Canadian, born in New Brunswick. He was the discoverer of the largest gold nugget ever found in the world, the famous "Welcome Nugget," found in the Ballarat camp by Mr. Napier and his partners, who went from Canada to Australia at the time of the Australian gold excitement in 1852.

The nugget weighed 2195 ounces, nearly 183 pounds, and contained only a small quantity of gangue. The nugget was placed on exhibition at the first Crystal Palace Exposition in 1853, and the owners took in thousands of pounds from curious sightseers. After the exposition the nugget was bought by the Bank of England for £8376 10s. 6d.

At the time the big nugget was found the Ballarat district was overrun by bushrangers and Napier and his partners did not dare let a hint drop of their phenomenal good fortune. They hurried the big lump of gold in their tent and proceeded in their diggings as usual. Later, after declaring that their claim was valueless, the men packed up the big nugget in a bullock cart and made for the coast, where they took ship for England.

Some Useful Formulas.*

[HYDRAULIC HEAD: $P = 0.434 H$]

Water pressure is usually not so easily understood as steam or air pressure. The two sorts of pressure may affect the gauge the same way, but their causes and nature are different. The reason is found in the fact that water and steam have different physical properties. Steam is compressible, water is incompressible. Steam exerts pressure because it is compressed and confined within a limited space; water exerts pressure because of its own weight, or because of the weight or force of some outside agency acting upon it. Gases and vapors differ from liquids in that they are elastic and are always seeking to expand against any force holding them in confinement. The small particles or molecules of which the gas is composed seem to repel each other—they have a tendency to remain as far apart as possible—while in a liquid the tendency seems to be directly the opposite; that is, the molecules attract each other and remain as close together as possible. That is the reason why a liquid cannot be compressed while a gas can be, and that is why a liquid exerts no expansive pressure while a gas does.

All gases may be changed to liquids by cold and pressure. This statement was formerly only a theory, not actually demonstrated. In just the same way that cold and pressure change a gas into a liquid, so heat and the absence of pressure change a liquid into a gas. Just what goes on when heat is applied to a liquid—say water, for example—no one can say. We know that the heat is absorbed and the water turns to steam. We say that the heat has become latent, which means that it has ceased to be heat in its usual form, and has become some other kind of energy which has given to the molecules of the water a certain activity causing them to repel each other, giving rise to the force of expansion. This tendency to expand causes pressure when we confine the steam in a limited space.

The pressure of water is very different. Since it cannot be compressed, it cannot exert any expansive force. Its pressure is due to the force of gravity or to some external mechanical force acting upon it when confined, as, for example, the plunger of a pump or the ram of a hydraulic press or accumulator. Disregarding for the moment these latter

FIG. 1.

mechanical causes, let us consider the natural cause of water pressure and the laws of its action. In Fig. 1 we have a vessel nearly full of water. We will say that the base of the vessel is just 1 square foot in area and that the water stands 1 foot high. Then we have 1 cubic foot of water, weighing about 62½ pounds. It is easy to see that the total pressure at the bottom of the vessel is 62½ pounds, which is equal to $\frac{62\frac{1}{2}}{144} = 0.434$ pound per square inch. In Fig. 2 we have a vessel of another form, the area of whose base is still 1 square foot, but the area at the top is only about half as much. The water stands 1 foot high, as before, but there is less than 1 cubic foot of water. We will say that the vessel is so much cut away at the top that only $\frac{1}{2}$ of a cubic foot, or 41.7 pounds, of water is present. The total pressure on the bottom will be the same as in Fig. 1, despite the fact that there is only two-thirds as much water present. This pressure will be 62½ pounds, or 0.434 pound per square inch, as before. The pressure within the dotted area is 0.434 pound per square inch because a column of water 1 inch square and 1 foot high rests on each square inch of this space. Outside of the dotted area is a column of water 1 inch square and 6 inches high above every square inch of the bottom. The pressure due to the weight of this column is 0.217 pound per square inch, or one-half of 0.434. The top of each of the columns is pressing against the top of the vessel. To prove this, make a small hole and the water will spurt out; or, if you insert a little tube, as at A, the water will "seek its own level." Then the pressure on this top partition is due to the height of the water in the open part of the vessel, and since this is 6 inches high the effect is the same as if the sides of the vessel were straight and the water stood 1 foot high, as in Fig. 1. That is to say, the pressure on the top is 0.217 pound per square inch, and this pressure is balanced by an equal pressure at the bottom, i. e., if the water presses upward against the top partition,

it must also press downward with the same force directly under the partition.

To this must be added the actual weight of the water, or 0.217 pound per square inch, making the total pressure 0.434 pound per square inch outside of the dotted area as well as within.

We started out by saying that water pressure is due to the weight of the water, and in a general way this is true, but the foregoing illustration should make it plain that something else besides weight must be considered, namely, height. It is not the quantity of water present that determines the pressure. The pressure is the same in both Fig. 1 and Fig. 2, although there is less water in the second case than in the first. But the height of the water is the same in each case, and therefore the pressure is the same. Take Fig. 3, for example. Here we have, say, one-tenth as much water as in Fig. 1, and yet the pressure on the bottom is the same as before, namely, 62½ pounds, or 0.434 pound to the square inch.

We cannot fix it too firmly in our minds that it is the height of the water level which determines the pressure upon any submerged surface. It would, perhaps, be more correct to say that the pressure upon any submerged surface depends upon two things, namely, the weight of the liquid and the height of the free surface. We must rid our minds of the idea that the quantity of liquid present has anything to do with it. This is sometimes called the "hydrostatic paradox."

The height of the free surface of the water, or the water level, is called the hydraulic or hydrostatic head, and the pressure due to the head is computed by the simple formula, $p = 0.434 h$ or $h = 2.3 p$, in which p equals pressure in pounds per square inch, and h equals the head in feet, that is, the vertical height of the free water surface above the submerged surface in question. We have already demonstrated the truth of the formula when we showed that with the water level 1 foot high the pressure was 0.434 pound per square inch, whatever the shape of the vessel or the quantity of water present.

The same principle applies to all liquids, but the numerical values in the formula depend upon the weight of the liquid, and are given above only for water. They would be different for any other liquid. For instance, for mercury the formula would be $p = 5.9 h$, or $h = 0.0169 p$, and, for olive oil, $p = 0.399 h$, or $h = 2.51 p$.

Since a mercury column is commonly used to measure small pressures, a few words on this subject in passing will not be out of place. The weight of the atmosphere at sea level is about 14.7 pounds per square inch, and this pressure will balance a column of mercury very nearly 30 inches high. For ordinary engineering work it is enough to say that a pressure of 15 pounds supports 30 inches of mercury. Then 2 inches represents 1 pound and $\frac{1}{2}$ of an inch represents 1 ounce. Fig. 4 illustrates a crude apparatus which any one can make in an hour, and which the writer has used in experimental work to advantage. Occasion has frequently arisen in experimental work on tests of one sort or another to measure pressures or differences of pressure which the ordinary steam gauge will not record with any accuracy, and for which the indicator cannot be well applied. This little mercury gauge has given excellent results in such cases, since it indicates pressures as small as 1 ounce, and since it will measure vacuums as well as pressures.

Any engineer can make one for himself by securing a piece of glass tubing, about $\frac{1}{4}$ inch outside diameter and $\frac{1}{8}$ inch or so inside diameter, at a chemical supply house. The tube should be 4 or 5 feet long, so that each leg will be 25 or 30 inches long when bent. To bend, hold the tube in an ordinary gas pipe. Heat slowly and bend gradually, so as not to flatten the tube. The U tube should now be mounted upon a board upon which has been marked off a scale reading in inches and eighths of inches. Pour in mercury until each leg is half full. For measuring a pressure, connect one leg with the vessel under pressure by means of a rubber tube. A pressure will cause a difference in levels one way, a vacuum the other way, as will be readily understood. In reading remember that it is $\frac{1}{2}$ inch to the ounce. For measuring differences of pressure, connect one pressure to one side and one to the other.

So far we have considered only the pressure on the bottom of a vessel. What about the pressure on the sides? We can best answer this by stating a general rule, which is as follows: The pressure on any

submerged surface is equal to the area of the surface in square inches multiplied by the pressure per square inch at its center of gravity, which for a plane figure will be its geometrical center; and the pressure at the center is, of course, determined by our formula, $p = 0.434 h$. Remember this rule, and you can figure the hydrostatic pressure on any surface, no matter what its shape, size or location. Take an example for illustration:

What is the total pressure on the surface A in Fig. 5, assuming it to be 3 feet square? Solution:

FIG. 5.

$$\begin{aligned} h &= 12'; \\ p &= 0.424 \times 12 = 5.208; \\ \text{Area} &= 3 \times 3 = 9; \\ 9 \times 5.208 &= 46.872 \text{ pounds. Ans.} \end{aligned}$$

Find the total pressure on the sphere B, Fig. 5. Solution:

$$\begin{aligned} h &= 11; \\ p &= 11 \times 0.434 = 4.774; \\ \text{Area} &= \pi D^2 = 3.142 \times 9 = 28.278; \\ 28.278 \times 4.774 &= 134.89 \text{ pounds. Ans.} \end{aligned}$$

As previously stated, hydrostatic pressure may result from some mechanical force acting upon water in a confined space, as, for example, by pumping. It should be borne in mind that water always has a pressure due to its own head, irrespective of any outside pressure imposed upon it. It will be sufficient to say that this outside pressure is transmitted undiminished throughout the whole system. It must be corrected, however, by adding to it the pressure due to the hydrostatic head at any point to find the total effective pressure at that point.—J. Lewis in Science and Industry.

Protection of Wire Ropes.

Widely different uses of operative wire ropes present a problem for exterior protection to answer the wide range of requirements. A dry atmosphere, tending to speedy oxidation and brittleness, and consequent sloughing off of coating, presents itself in one location, while at another a moist atmosphere, or possibly an almost continuous subjection to water, sometimes impregnated with acid, prevails. Many exposed wire ropes are subjected to the extremes of summer and winter. The illustration herewith presented shows application of a special coating termed Wire Rope Shield, which the manufacturers say possesses the requisites of a satisfactory coating in being tenacious, pliable, lubricating, waterproof and free from destructive acid. The high points of the strands are protected from abrasion by a lubricating film deposit, and a like deposit prevents chafing of the wires, the rope being completely sealed to resist acid, atmospheric, gaseous, sulphurous or water attacks. The use of this shield on wire ropes from an office building to extremely wet mines, strongly impregnated with acid, and to dredging machinery, constantly subjected to water, would test its efficiency. The illustration also shows an interior material termed Wire Rope Filler, a flexible, cushioned lubricant, to protect from abrasive wear and effectually seals against water soaking, acid or gaseous attacks incorporated in the manufacture of wire ropes. The Ironsides Co., Columbus, Ohio, manufacture these materials.

FIG. 4.

Prospecting for Oil.

WASHINGTON, D. C., Aug. 26.

SIR: For your information and guidance in regard to the rights of miners and others prospecting for oil, you are informed as follows:

First.—The right to prospect is accorded to citizens of the United States and those who have declared their intention to become such.

Second.—A prospector has no oil claim to any land until oil has actually been discovered thereon. The mere seepage of a little scum of oil on waters coming out of the ground in the vicinity or on the land does not constitute such discovery.

Third.—Actual prospecting for oil or developing of an oil mine can not be done by building houses, camps or trails and roads, and the extensive cutting of timber for such alleged prospecting and development must not be tolerated. Legitimate prospecting for oil consists in actual boring with proper equipment, and where such legitimate prospecting is done, prospectors should be accorded the privilege of cutting the necessary timber therefor.

W. A. RICHARDS,
Acting Commissioner General Land Office.

Metallurgical Practice at the Greenwood Smelter.*

By PAUL JOHNSON, E. M.

The B. C. Copper Co.'s smelter commenced operations on Feb. 18, 1901, with one blast furnace, 42x150 inches at tuyeres. This was kept in blast until Aug. 22, when it was shut down nine days for repairs, and started up again on Aug. 31, since when it has been continuously in blast. During the time from Feb. 18 to Dec. 31, 1901, in this one furnace, 117,077 tons of ore were smelted and 3714 tons of matte, assaying from 45% to 60% in copper, from two to six ounces in gold and from ten to thirty ounces in silver were produced. Besides Mother Lode and Boundary ores, there have been smelted some gold quartz ores of 80% to 90% silica, utilizing the basic character of the Mother Lode ore. The largest tonnage was put through during the month of December, when 13,098 tons of ore were smelted, thus averaging for the entire month, for every twenty-four hours, 422½ tons of ore. The largest tonnage smelted in one single day was on Jan. 10, 1902, when the furnace put through 459 tons of ore. To handle this amount of material, and to break up and pile the matte produced—the work of the blast furnace proper—in twenty-four hours, twenty-nine men were employed, viz.: six charge wheelers, four coke wheelers, nine feeders (on eight-hour shifts), two charge weighers, two furnace men, two matte tappers, two roustabouts and two foremen; thus, during December 14½ tons of ore were handled per man per day. Counting the total force of the smelter, the sample mill requires ten men for unloading and crushing ore, sampling and distributing same into ore mixtures, and loading the shipping matte, engineers, foremen, one blacksmith with a helper, one carpenter, besides eight more men, making the total number of men employed, including foremen, forty-seven, which, at 422.5 tons of ore put through daily, makes nine tons of ore handled and smelted for every man employed—which I believe is a record.

As for the character of the Mother Lode ore, it may be classified into limy, irony and sulphur ores, and it is desirable for the smelting to have reserves of these different kinds to help out at times, when in the daily tonnage from the mine too much of one or the other sort is on hand. I give below the assay and analysis of three large lots of these different ores:

- Sample of irony ore from 1000 tons lot.
- Sample of limy ore from 1600 tons lot.
- Sample of sulphur ore from 120 tons lot.

	a. Irony.	b. Limy.	c. Sulphur.
Copper.....	2.8%	2.2%	2.7%
Gold.....	0.11 ozs.	0.09 ozs.	0.15 ozs.
Silver.....	0.58 ozs.	0.43 ozs.	0.15 ozs.
Insoluble.....	28.7%	35.2%	29.8%
Fused Silica.....	16.9%	29.2%	24.5%
Iron.....	32.7%	14.7%	17.5%
Lime.....	5.6%	19.8%	16.0%
Sulphur.....	3.7%	5.3%	13.7%

The character of these ores is not only self-fluxing, but at times rather basic. I have, therefore, sometimes smelted to advantage as much as 5% to 6% of straight quartz ores with them.

Before starting up the furnace, I had my doubts whether I could make higher grade matte than 30% to 35% copper, without resorting to roasting the ore, but I found by actual practice, what I had hoped, that the irony variety, which is magnetic oxide of iron (Fe_3O_4), in smelting and reducing its iron to Fe_2O_3 for the slag, gives off one atom of oxygen for every molecule of Fe_3O_4 , and this oxygen acts as a powerful desulphurizer, so that I have, in fact, burned off as much as 85% to 90% of the sulphur in the charge at times. I have aimed at making a 45% to 50% copper matte, but sometimes it has come out as high as over 60% copper, through having had rather much of the irony in the charge. I may mention, in connection with making this high grade of copper matte, an interesting fact, viz.: that whenever the matte begins to come up to 53% copper and above, the gold will "lock up" in the furnace in the metallic copper bottoms which form. One week, when making 58% to 63% copper matte, I had gold locked up to the value of \$6000 in the furnace bottom; the next week I had sulphur ores with which I could get the matte down to 45% copper, and I then got all the gold out in five days. Silver does not behave in this way.

The Mother Lode ore is exceptionally free from arsenic and antimony and behaves quite differently to certain other British Columbia ores which carry quite an amount of these metals, and in running which I have found metallic copper and speiss separate out as soon as the matte came up to 47%, causing much trouble in filling up the tap-hole, and threatening in this way to plug up the furnace. To obviate this I have found it necessary, elsewhere, to change the trapped spot to the ordinary way of stopping up the tap-hole with clay, and when the bottom was rising up inside the tap-jacket I used to blow the furnace for five minutes, and the blast, following through, melted the gathering metallics and speiss. With the

Mother Lode ore, however, I have made as high as 67% copper matte in the blast furnace, using trapped blast, without filling the tap-hole with metallic copper.

For its size (42x150 inches at tuyeres), I think this furnace has the best record so far for large tonnage and, at the same time, cleanness of slags made. The coarseness of the ore has a great deal to do with tonnage, and to some extent clean slags, as was discovered when we began to crush it to a 5-inch size, instead of from 2 to 3 inches, as at first. A couple of per cent of silica, more or less, in the slag does not slacken these big furnaces up as quickly as it does smaller ones; neither is high lime as bad. What I have found troublesome, raising the copper in the slag and making it heavy with a poor separation of the matte, is when the iron of the slag comes up to 30% and 32%, and silica at the same time is low, say, 28% to 30%.

I give below examples of some different kinds of slag made, with the corresponding tonnage:

Nov. 7, 1900.—Slag: $\text{SiO}_2 = 42.7\%$; Fe, 21.1%; CaO = 20%, and Cu 0.33%; matte, 44% Cu; furnace smelted 393 tons of ore.

April 1, 1901.—Slag: $\text{SiO}_2 = 33.8\%$; Fe = 25.4%; CaO = 25.7%, and Cu = 0.25%; matte went 49% Cu; tonnage, 402 tons of ore; high lime has a tendency to make the slag free from Cu.

July 7, 1901.—Slag: $\text{SiO}_2 = 30.9\%$; Fe = 32.5%; CaO = 16.8%; Cu = 0.44%; matte, 53% Cu; tonnage, 399 tons.

Jan. 10, 1902 (when the furnace put through 459 tons of ore).—Slag: $\text{SiO}_2 = 37.8\%$; Fe = 24.5%; CaO = 20.9, and Cu = 0.35%; matte, 49% Cu.

We make slag assays for copper twice a day, but do not make it by the generally adopted colorimetric method, which, as a rule, gives too low results and deceives the metallurgist, making him believe and tell others that he makes cleaner slags than he does. The slag samples are taken every hour, chilled in water, and the day and night shifts kept apart. Two grams are taken for the determination, dissolved in hydronitro-chloric acid and evaporated with H_2SO_4 diluted, and the copper precipitated with hyposulphite of sodium solution; the Cu_2S is dissolved in HNO_3 and titrated with KCy; this determination takes somewhat over two hours, but it is correct and reliable, and it will check, as I have proved, to 0.01% of copper. Where you have very little copper in your charge, it is important to have accurate determinations of your slags and to keep them low in copper, as 0.1 of 1% makes quite an item. These daily slags are then put together, and once weekly an average assay of them all is made for gold, silver and copper. The slags, as a rule, have been very clean, as follows:

Copper, varying between 0.30% and 0.037%.

Gold, varying between 0.0025 and 0.0035 ounces.

Silver, varying between 0.04 and 0.07 ounces.

Of course, more copper in the slag is allowable in making 50% Cu matte than in making 30% Cu matte. Formerly it used to be considered good smelting to have only 0.1% copper in the slag for every 10% copper in the matte; thus, in making 30% Cu matte, 0.3% Cu in the slag was permissible, and so forth.

The amount of coke used is from 11½% to 12% of the weight of the ore. The blast used is from a 7½ Connersville blower, making 155 revolutions per minute and giving 80 cubic feet of air per revolution. The blast furnace averages 1½-inch mercury, equal to fourteen ounces.

The feed height above the tuyeres varies from 4 to 8 feet, when little sulphur of much coarse ore, feeding high, when much sulphur of much fine ore, feeding low. The best feed height for good running I have found to be from 7 to 8 feet.

As to the running of the furnace, charges of three tons are put in at the feed floor by feeders, and not by any mechanical device which, as I have had occasion to find out, do not pay, but cost a good deal of money and give a bad working furnace and dirtier slags.

A charge comes down to the tuyeres in three-quarters of an hour. Slag and matte run together continuously through a trapped spout into a water-jacketed forehearth on wheels, inside dimensions being 8 feet long by 5½ feet wide by 3 feet deep. The matte, having a specific gravity of 5 to 5.3, sinks to the bottom, and the slag of a specific gravity of about 3.4 to 3.5, overflows at the farthest end into a large settling pot, and from this into the granulating flume. The matte is tapped at intervals into matte pots, the contents of which are poured into matte molds 2 feet wide by 5 feet long by 4 inches deep, thus cooling off the matte quickly, and delivering it in the shape of cakes 1 to 1½ inch thick. These matte cakes, when cooled, are knocked down on the top with sledge hammers and broken up into 3-inch to 5-inch pieces and shipped this way in bulk into box cars, the lots averaging thirty tons. This does away with a crusher and sacking and makes the matte pots last longer.

ENLARGEMENT OF THE PLANT.—We have during the latter part of 1901 been at work to double the capacity of the smelter, and to this end erected new sets of lower ore bins, twelve in number, with an increased storage capacity of 5000 tons, making a total storage capacity for the lower ore bins of 10,000 tons. Another 560 feet long railroad trestle has been built between the two previous ones in order to facilitate

and make possible the handling of over 1000 tons daily of material for the smelter by the railroad. The foundations for the furnace building extension and the new second furnace are in, and cast iron columns and deck plates for the new second furnace have been put up. The furnace will be finished as soon as the weather allows the putting up of the brick-work for it. The new 7½ Connersville blower is ready and in place for the furnace. With this second furnace, which is now completed, the plant has a daily capacity of over 800 tons of ore, and, together with coke, coal and matte, the railroad will have to handle nearly 1000 tons daily.

We figure on getting eventually three to four furnaces going, and shall then add converter works for making the matte into blister copper.

The Chlorination Process.

In the chlorination process the chemicals required are sulphuric acid, chloride of lime, sulphide of iron and sulphur. Sulphuric acid is shipped in drums of sheet iron of about 1600 pounds each; also in tank cars, similar to oil tank cars, of 24,000 to 50,000 pounds. The price of acid varies from \$1 to \$1.50 per 100 pounds at the chemical works. Chloride of lime is put up in sheet-iron drums of 500 pounds each, also in casks of about 1200 pounds. The present San Francisco quotation for it is \$2.50 per 100 pounds. Sulphide of iron can be purchased in casks of about 700 pounds at a cost of \$5 per 100 pounds, or can be made on the ground from crude sulphur and wrought iron. Sulphur can be purchased in casks of 300 pounds at a cost of \$2.50 per 100 pounds.

The process can be used to treat: All classes and values of siliceous oxidized gold ores; concentrates from the concentration of tailings of free-milling gold ores; telluride gold ores; iron and arsenical pyrites, zinciferous and antimonial ores carrying gold; ores that will not concentrate effectively and do not carry over 3% copper or 5% lead, and are not excessively high in alkaline minerals; siliceous tailings carrying a valuable quantity of gold. The process saves gold values only. Silver can be saved when this process is used by an auxiliary method.

* Men marked thus are not required when the mill is treating the ore of one mine.

Miscellaneous supplies, including assay materials, fluxes, filter press cloths, lubricating oils, incandescent lamps, etc., can all be covered with a charge of 15 cents per ton. Renewals and repairs will cost, depending on the location of the plant, from 15 to 30 cents per ton. The amount of water required can be safely estimated at 500 gallons per ton—for steam power and chlorination. This can be reduced if settling tanks are added, and water used over again.

Hydraulic Licenses.

Some time ago the California Debris Commission issued a notice stating that all licenses then in existence granting the privilege to mine by the hydraulic method would be canceled, and that it would be necessary for new licenses to be issued by September 1, 1902. This because it was desirable to have all permits issued in accordance with a new form adopted by the commission. Heretofore these licenses have been typewritten. The new licenses, which are lithographed, read as follows:

Revocable License, No. _____.

By virtue of authority conveyed by Act of Congress, approved March 1, 1893, the California Debris Commission hereby issues a license to _____ to mine by the hydraulic process in the _____ mine, near _____, California.

The operations of this mine are to be conducted in accordance with the instructions that may from time to time be given by the California Debris Commission.

* Minister of Mines Report.

What Constitutes a Mine.*

In the broadest sense a mine may be said to consist of a body of ore sufficiently large and rich to pay the original purchase price; all of the costs of mining, reduction, plant and transportation, together with a large percentage of interest on the investment. In determining, therefore, what constitutes a mine, it is necessary to consider each item of possible expense chargeable against the property, all physical and geological conditions, and such ore bodies as are developed, together with their bearing upon possible future ore bodies. Location of the property is likewise important. In this connection one must consider the availability of water, fuel and timber; the accessibility of the property, both for the purpose of shipping supplies to the mine and of marketing the ore or bullion. Dumping ground, mill and possibly even smelter sites have to be considered.

For the actual measurement and sampling of the mine there must be development work, and, when sampled, it is necessary to determine the actual value of the ore as it would be mined; what values can be saved and by what method the greatest percentage of profit will accrue to the operator.

The geological and physical problems in connection with the determination of a mine deal perhaps more with the future of the mine than with the actual cash value of the mine. In this connection one must consider not only the enclosing rocks, their persistence, definition and influence upon the mineralization, but must take into consideration the fissure, and, if present, the fault systems, because in the majority of deposits the ore occurs in fissures and faults, as we say, in "fissure veins." Fissures and faults are additionally important, because in many cases, as, for example, contact and impregnation deposits, the continuity of the ore body must be determined. If faulted by intersecting fissures, this must be known and the consequence determined. It is a fact ore bodies are more often irregular in dip, strike and form than otherwise, the valuable portion of the ore being controlled by some physical fact, such as the intersection of fissures with certain strata, or igneous rocks, or with each other. In a known mining district it is always possible by careful observation of these facts to calculate the position of valuable bodies of ore. In the district of Rico, Colo., there are many vertical veins which intersect a great bedding plane or fault of disturbance, approximately parallel to the strike and dip of the strata. The mining in that district has demonstrated the occurrence of large bodies of rich ore at this point of intersection. So regular are these strata, the veins, and this fault in strike and dip, that within reasonable distance one can calculate the position of the ore body and some value for it without development. This, however, can not be as great as the actual worth, because that previous to sampling and measurement the exact value can not be determined. In a very much simpler form the same condition of affairs, as far as value of property is concerned, exists in Butte. I would say that the great bulk of business which leads to the development of mines is done through lease and bond, the lease being for the purpose of opening and testing the property to see if it is worth the price which the bond calls for. The life of the bond is usually not less than one year.

The character of the ore above and below water is an important factor, because in most cases an entirely different method of treatment is necessary for the two ores. Above water level frequently we have high-grade ores that can be quickly and cheaply reduced by a simple mill upon the ground, whereas below water level the mill process may be involved and expensive or it may even be necessary to smelt the ores. These are important items in the cost of production because of the additional plant required and the uncertain factor of cost of reduction. Finally, from the geological standpoint it is necessary to consider whether the ores, even though sulphide, are primary or secondary. As many of my auditors know, if perchance they have followed or read the geology of Butte, as exemplified by Emmons, Wood, Van Hise and others, that in many cases there is a zone in the vein wherein are deposited below water level very rich bodies of ore which under normal conditions might be reasonably supposed to be permanent. Experience and depth have taught us that though the ores are still profitable, even in the face of constantly increasing mining cost, due to the greater depth from which the ore is mined, they are not by any means the bonanzas they were.

Butte is not the only mining district to suffer in this respect, many of our precious metal mines and sulphide copper deposits having more or less striking examples of this phenomenon—a zone of oxidation, a zone of sulphide enrichment and a zone of permanent values.

We have been dealing with the future of mines perhaps too extensively, but let us consider upon what basis a mine should be bought and paid for. Recalling the definition given in the beginning of the paper,

"A mine must contain ore bodies sufficiently large and rich to repay all charges against them, including capital invested and a large percentage of interest," would naturally lead to the question of how to determine these facts. It is manifest that the gross values are to be determined only by actual measurements of the ores blocked out, and the determination of the values by careful and conscientious sampling, with sufficient precautions are checks to assure the engineer that his results are absolute.

As the ore bodies, like other bodies, have three dimensions, they can only be blocked out by actual development. These ore bodies must be cut and drifted upon at sufficient intervals to determine the length, size and form of the valuable shoots. It is rare that development is so complete that all the ore bodies can be treated with equal weight. It is, therefore, customary to divide one's estimates into three classes:

1. Ore technically in sight.
2. Ore reasonably in sight.
3. Ore that under the conditions existing should be expected with further development.

This done, it is but a step to a calculation of the gross value of the ore bodies.

The next step must necessarily be the determination of the methods of mining and treatment of the ores for all time and of whatever grade and kind. The low-grade and the high-grade ores, the oxidized and the base ores, and to calculate the cost of converting them into cash.

The following is a reasonably complete summary of the charges which must be borne by a property before it can be considered a "mine:"

1. Cost of mining, labor and supplies.
2. Cost of development, labor and supplies.
3. Cost of reduction, teaming (tramping), milling, freight, smelting, losses in milling and smelting, commissions.
4. Cost of equipment of the mine.
5. Cost of equipment of the mill.
6. Cost of equipment of the smelter (if advisable to build).
7. Cost of the mine.
8. Cost of possible litigation.
9. Cost of management.
10. The amount of interest on the money advanced for purchase and equipment at nominal rates; and, finally,
11. A large percentage of profit.

These costs are distinctly chargeable to the mine and must not exceed the gross value of the ore as calculated above.

This does not constitute the entire field that has to be examined. We in Butte have been compelled to look to our titles and our rights under these titles. We must determine, after being satisfied that we have a legal title to our property, what is the extent of our rights in our own ground and outside of it. If we have extralateral rights and if there is a possible conflict of title to the very ore bodies in question through ore bodies coming from other than the ground in question. While there are few camps that have been so busily engaged in litigation as has Butte, there is no district where such matters can be safely overlooked. Even Butte existed nearly thirty years without litigation.

These are the principal points, broadly generalized, that must be considered in the determination of the question of what constitutes a mine. I do not wish to leave the subject, however, here, lest I should give my hearers the impression that only under such conditions can money be properly invested in mining properties. While I adhere to the above principles, I wish to state that they refer to cash purchases, as one would buy a horse or a house. It is something material. Opportunities for investments of such description are not abundant. Indeed, if this were the only method of mining investment the industry would be greatly crippled, for the discoverer would have to do all the development work, block out all the ore himself, and were he financially able to undertake such a task he would not be climbing mountains, living in the woods on bacon, canned cow and, as Eugene Field says, "other native fruits and things that grow out West in cans."

The property is only a prospect. It is leased and bonded for a period of time—usually one year. The lessee explores the ground with shafts, tunnels, drifts and crosscuts; and if satisfied in the course of time that he has his money's worth, he buys the mine under the terms of the bond. The smaller investment necessary for the exploration, and the smaller consideration usually demanded as the final price for the property, make this method attractive to many. But, unfortunately, only a very small percentage of prospects turn out to be mines at any price, so that this form of investment is purely speculative, and being speculative, has become a greatly abused field. It is the field of the middleman, who, with an insignificant investment, can organize a mining company, and through glowing accounts of possibilities and certainties interest many to invest money. I do not say this with any intention to be harsh, but as the property is not developed it must of necessity be a speculative venture to advance funds for the operations, and only those properties should be considered which are thoroughly described and favorably reported upon by competent, reliable persons.

May Lundy Gold Mine.

Written for the MINING AND SCIENTIFIC PRESS by H. W. TURNER.

The May Lundy mine is perhaps the most picturesque located of any in the State of California. It lies in Mono county, on the east slope of a high ridge of the Sierra Nevada, surrounded on all sides by grand mountain scenery. Within a radius of a few miles are the following peaks: Mt. Dana, altitude 13,050 feet; Mt. Conness, altitude 12,556 feet; Mt. Warren, altitude 12,337 feet; and Dunderberg peak, one of the dominant points of the rugged group north of Mill Creek canyon. The canyons vie in depth with the mountains in height, notably Mill Creek and Lee Vining Creek canyons, while not far east lies the dead sea known as Mono lake. At the base of the ridge, known as the Tioga crest, on which the mines are located lies a beautiful alpine lake of fresh water. At the outlet of this lake is the quartz mill, which obtains its water supply from the lake, the height of the lake having been increased by building a dam across the outlet. On the side of the escarpment, about 1200 feet above the lake, are situated the miner's boarding house and bunk house, as well as the blacksmith shop, etc. The ore at the present time is brought down from the tunnels to the mill on a cable in iron buckets. The property of the company comprises several veins, all of them situated in the same high spur. This spur (the Tioga crest) is composed on the west side of the slates of the Tioga formation and on the east side of a quartz-diorite or

May Lundy Mill, Mono County, Cal.

granodiorite. The plane of the contact of these two rock masses dips to the west at a high angle, and along this contact there is a vein known as the contact vein.

The veins now being worked, however, lie in the quartz diorite or granodiorite, dipping to the west. Three of these are known as the Jackson vein, West vein and East vein. They are from 30 to 100 feet apart. An examination of these veins in the tunnels and other workings shows them to be mineralized dikes of an aplite granite. The quartz veins proper occupy, at all points noted, the middle of these dikes, and often include chunks of apite which are impregnated with sulphides and form ore. All of the quartz of these veins is said to be of high grade and is milled. The dip of the veins varies, that of the East vein at two points being from 50° to 55° to the west. In the mines there are greenstone dikes which, according to Mr. Pierce, superintendent Crystal Lake G. M. Co., cut the veins and are therefore later than the apite dikes. Whether they are later than the quartz impregnating the dikes was not determined. These apite dikes are intruded along a joint system, the planes of which dip southwest at angles from 20° to 50° or more. Faults have frequently displaced the veins with a throw of from 10 to 30 feet, and the dark greenstone dikes are usually intruded along these faults. So far as known, this mine is the only one in the Sierras of any importance in which the veins are uniformly associated with apite dikes.

At the level of the mill a new tunnel has been run in to tap the veins at that level, and to furnish a cheap method of extracting the ore and transporting it to the mill. Mr. Pierce gives the total production of the property up to 1900 as \$180,000. The values are almost entirely in gold. An electric plant has been installed, and the lower tunnel is being run by machine drills with electric power, which is also used in operating the mill. Below the mill is a cyanide plant to handle the tailings.

All of the apite-dike rocks of the Crystal Lake

*A paper by GEO. W. TOWER, read at the Butte, Montana, session of the Mining Congress, Sept. 3, 1902.

mine veins are altered. The ore is more or less oxidized, even in the lowest workings 900 feet from the croppings. This may be due to the percolation of surface waters along the veins. The level of ground water is below the bottom of the present workings, this being due to the thorough jointing of the granodiorite and the steepness of the slope of the spur in which the mines lie. The concentrates are said to contain 6% of arsenic.

Forming a part of the north end of the Tioga crest is a dark porphyry, possibly the same rock as the greenstone which occurs as dikes in the mine.

Hoisting Engine at Oliver Iron Co.'s Mine, Ely, Minn.

The accompanying illustration represents the new double-drum Corliss hoisting engine, built by the Sullivan Machinery Co. of Chicago, Ill., now being installed at the Savoy-Sibley shaft of the Oliver Iron

with spiral grooves for 1½-inch rope. The gross load which each drum is capable of lifting is 29,000 pounds; seven tons of ore will be raised at each trip. Each drum is provided with two heavy band or strap brakes, which operate simultaneously. The powerful band friction clutches are located at the centers of the drums. The drum shafts are 36 feet long, 14 inches in diameter, supported by three bearings. There are two auxiliary rope reels, located inside each main drum, for taking up the slack of the hoisting ropes.

The engines are of the Corliss pattern, 28x60 girder frame, steam-jacketed throughout; when operating condensing the boiler pressure is 125 pounds; this is, however, increased to 150 pounds in case of accident to the condensing apparatus. The maximum hoisting speed is 2000 feet per minute, controlled by a quick-acting governor in connection with the Corliss valve gear. The engine reverse gear is of the steam-actuated spiral type. The brakes and clutches are

sure valve, which will automatically substitute air for steam or steam for air, in the case of failure of either operating medium. The machine has all modern safety appliances. These include positively actuated stops to prevent overwinding, dial indicators to show the position of the cages in the shafts, and automatically operated throttle valves for shutting off steam near the end of the hoist. There is also a small auxiliary throttle valve for controlling the engines after the main throttle has been automatically closed. This is operated by a step on the engineer's platform. Each Corliss cylinder is provided with two by-pass valves for connecting the two sides of the pistons when lowering. The engineer's platform is raised above the floor, and all hand levers and safety appliances are within easy reach of the operator.

A hoist of similar style, with but one 12x8½-foot drum, is operating on the Pioneer A shaft near by. The Sullivan Machinery Co. also manufacture flat rope reel hoists, conical drum hoists and winding engines and haulage plants for all classes of work. A letter to the company at 135 Adams St., Chicago, Ill., 71 Broadway, New York, or 431 Seventeenth St., Denver, Colo., will bring special catalogues and complete information.

Con. Mercur G. M. Co., Mercur, Utah.

JOHN DERN.

John Dern, president Consolidated Mercur G. M. Co., Mercur, Utah, makes annual report for the fiscal year ending June 30, 1902, showing gross value of gold produced: Golden Gate mill, \$1,359,844.10; Manning mill, \$97,220.37; total, \$1,457,064.47.

The average assay value of all the ore mined and milled during the year was \$5.72. The tailings averaged \$1.19.

The mining costs were \$1.41 and the milling costs \$2.09 per ton, a total of \$3.50 per ton.

The expenses have lately been considerably reduced. During the last three months of the year covered by the foregoing figures the mining costs averaged \$1.32 and the milling costs \$1.70, or a total of \$3.02 per ton.

The dividends paid during the year amounted to \$465,000.

Prior to the period covered by this report the company paid \$235,000 in dividends. The total dividend disbursements of the Consolidated Mercur G. M. Co. to June 30, 1902, were \$700,000.

During the year the old Mercur G. M. & M. Co. paid its final dividend—\$9500—bringing that com-

Double Drum Corliss Hoisting Engine.

M. Co.'s mines, near Ely, Minn., occupying a floor space of 42x32 feet, of powerful and heavy design, complete in every detail; total weight, 176 tons. The hoist is of the double-drum, direct-acting type, the drum being loose on the engine shaft and driven with band and friction clutches. Two hoisting shafts are operated by the hoist, each drum hoisting in balance from the two compartments of one shaft. The drums are 10 feet in diameter; 9-foot winding faces provided

also operated by steam, and the brake engines, clutch engines and reverse engine are provided with oil-cataract cylinders to prevent sudden or jerky movements of the various parts.

In addition to the main steam brakes above mentioned there are two sets of auxiliary brakes, one set being operated by compressed air and the other by a hand wheel on the engineer's platform. A special feature of the brake gear is the automatic pres-

COMPRESSED AIR TRANSMISSION

ADDITIONAL PRESSURE REQUIRED TO GIVE A

TERMINAL PRESSURE OF 75 lbs GAUGE, THROUGH 100 FT OF PIPE.

D.E. BIGELOW,

COMPARATIVE

FRICTION HEAD

pany's total up to \$1,490,500. DeLamar's Mercur M. Co. paid \$689,312.99 up to the time of the consolidation. Accordingly, the grand total of dividends paid by the properties embraced in the Consolidated Mercur G. M. Co. to June 30, 1902, is \$2,880,312.99.

The Manning mill was operated on old Mercur tailings, with some interruptions, during eleven months of the year. The extraction averaged 93.5 cents per ton and the expenses 59.4 cents per ton.

The most important improvement of the year was the extension of the Electric tunnel to the Lulu workings. Connection was made June 9, 1902, up to which time the tunnel was extended 1260 feet, making its total length 1660 feet. This tunnel affords a convenient and economical outlet for all ores in the Lulu and adjacent workings, and by means of a system of raises the ores from all portions of the Mercur mine can be cheaply handled through this avenue. The Electric tunnel runs under the reserves in the Lulu ore bodies and is connected with the workings above by a series of chutes. As the ore is broken it is dumped into the chutes, whence it is loaded directly into cars and conveyed to the shaft by electric locomotives. Where the ore was formerly handled three times it is now handled but once. The tunnel is large and straight, with long side switches—in fact, almost a double track the entire distance—is lighted by electricity, and well ventilated by raises and other connections to the surface. The trains run directly to and under the chutes. The road is equipped with two 10 H. P. electric locomotives, capable of hauling twenty tons per train, at a speed of 6 miles per hour, and eighty-seven cars of the capacity of one and one-quarter tons each.

The company has also driven a new tunnel, 335 feet long, to take the place of the old Saw Mill tunnel, which had been undermined, causing it to settle and close. This tunnel connects with the main shaft and affords ingress to and egress from the Golden Gate mine.

In the Golden Gate mine there are still large bodies of high-grade base ore, which are being drawn upon steadily for the regular proportion of the tonnage. In addition to the low-grade oxidized ore, there also remains blocked out a great amount of high grade oxidized ore, which is directly under a good grade of base ore. The latter must naturally be mined first.

Of the entire tonnage going through the mill, two-thirds is coming from the Mercur and one-third from the Golden Gate mine. On account of the past year's developments the Mercur mine has a large excess over the Golden Gate in ore reserves. The Mercur reserves are largely oxidized. Those in the Golden Gate are mostly base, where they are available. The base ore from the Mercur is more easily roasted than that from the Golden Gate, for, although they are mined from the same strata, there is a material difference in their general make-up and treatment. In the Golden Gate mine the base ores carry more sulphide of iron and arsenic than in the Mercur, and when the proportion of ores treated is right much better results are achieved. Accordingly, the Mercur mine furnishes most of the oxidized ore and part of the base.

The tonnage put through the mill has increased about 30% during the past four months. It was necessary to overhaul every piece of machinery in the mill in order to maintain a steady and high tonnage. They put in a complete set of roll shells and shafts and in many parts of the mill have put in new line and countershafts.

A simple mechanical change in the mill has proven economical. Up to last March there had been two driers used for calcining oxidized ore, or roasting base. These were expensive to operate and the results were not satisfactory. Since that time they have been stopped, and by means of an expenditure not to exceed \$50 the oxidized ore has been treated as well as when calcined with the driers, and the tonnage not reduced.

Mining and Metallurgical Patents.

Patents Issued September 9, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

TREATMENT OF ORE SLIMES.—No. 708,504; H. L. Sulman and H. F. K. Picard, London, England.

Process of treating ore slimes which consists in separating by means of centrifugal machine ore slimes from residual water with which they are mixed by adding a little lime to charge, removing bulk of water, thereby introducing into machine an amount of leach-

ing solution of volume equal to that of remaining quantity of adhering moisture introduced into slimes by centrifugal action, replacing moisture by added leaching solution.

APPARATUS FOR SEPARATING METALS FROM THEIR ORES.—No. 708,567; W. A. R. Loose, Provo, Utah.

Apparatus for separating metals from their ores, combination with muffles, of inclosure or housing for discharge ends of muffles, housing or inclosure being closed on all sides, except bottom, having openings containing transparent material, shield interposed between housing and discharge end of muffle, transparent portion in line with openings in housing.

DREDOER BUCKET.—No. 708,587; A. W. Robinson, Montreal, Canada.

A bucket, back of which is composed of single continuous casting, having horizontal stiffening flange and projecting parts C, C, to which shell plate of bucket may be bolted, means whereby hoisting tackle may make direct attachment with casting and reinforcing band or plate at upper edge of mouth of bucket shell plate upon which teeth are supported.

TRAP FOR AMALGAM.—No. 708,599; G. R. Tuttle, Grass Valley, Cal.

Amalgam trap comprising plate having recess therein, cell in recess comprising tubular body portion and partition therein adapted to be inserted into or withdrawn from either end of body portion and partition composed of dissimilar metals.

ORE ROASTING APPARATUS.—No. 708,615; A. M. Beam, Denver, Colo.

In ore roasting apparatus, combination with furnace and stack, of rotary shell, cylindrical conveyer passing through shell of such size as to leave concentric chamber between shell and conveyer, chamber being in communication with firebox of furnace at one extremity, and with stack at opposite extremity, parts so arranged that interior of conveyer has no communication with chamber, shell and conveyer being respectively provided with interior and exterior spirally arranged, longitudinally grooved ribs, and tongue connecting ribs whereby shell and conveyer are made to rotate together.

COMBINED GAS AND STEAM ENGINE.—No. 708,637; W. Heckert, Findlay, Ohio.

In combined gas and steam engine, cylinder having piston chamber, explosion chamber at one end, together with water space around cylinder and flues at each end separated from water space by suitable partitions or webs between inner and outer walls of cylinder; series of fire-flue tubes connecting flues through water space and subjacent water chamber with fire-flue tubes therein connecting flue at outlet from first-mentioned flues with similar flue at other end of water chamber; latter flue communicating with exhaust, to provide zigzag course for escape of residues of combustion, together with feed pipe for supplying water space through fire-flue tube containing water chamber and steam dome mounted on cylinder in communication with water space around same.

COMBINED ORE ROASTING FURNACE AND FUME SAVING APPARATUS.—No. 708,977; W. H. Motter, Denver, Colo.

Combination with combustion chamber, of rotary conveyer located therein, hollow feed screw connected with conveyer at one extremity, perforated pipe concentrically arranged in conveyer passing through feed screw, pipe connected to rotate with conveyer, stationary conduit connected with pipe, suction means connected with conduit for drawing off fumes rising from ore during roasting operation, liquid containing tank, conduit connected with suction means for forcing fumes into liquid of tank.

SAFETY ATTACHMENT FOR HYDRAULIC NOZZLES.—No. 708,693; P. Bouery, Weaverville, Cal.

Combination of two pipe sections, one of which is turnable in relation to the other, flanges on adjacent edges of sections, curved fingers detachably secured to one section adapted to engage flange on opposite section, nozzle and pivot connection by which it is secured to movable section, arms embracing and turnable about pivot connection, having one end fixed to one of pivoted parts, other end engaging segmental flanges on the other.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS

ALASKA.

Heavy rains since August 1 flooded the Treadwell mines. Superintendent MacDonald ordered all men underground brought up and all work ceased except pumping out water. The water was 3 feet deep on the 220 level.

B. C. Goodman, Kougarak district, says: "On a gulch 7 miles from Windy creek, toward Dabl creek, a man named Dinsmore found the remains of a cedar boat, which, from marks upon it, seems to have been built in 1763. It was put together with wooden pegs. We arrived here on July 31 and proceeded to get to work. We put up our sluice boxes in a place where the pannings showed good prospects. We got as much as 20 cents to the pan, but after two days' sluicing when we cleaned up we only got \$5. Since then we have crossed the creek in several places, an herculean task, as the gulch is 600 feet wide from rim to rim, with water bothering us all the time. Finally we got back to the original place, when we ran into the paystreak. Pans pay from 2 cents to 10 cents. We stripped ground and set up our boxes and sluiced about two hours. When we stopped for the day, in examining the sluice boxes I picked up two nuggets, 20 cents and 40 cents, respectively."

Valdez reports the first flow of coal oil in Alaska struck at Cotell Sept. 7 at a depth of 200 feet. The gusher took everything away and rose 150 feet before being finally stopped. Ten wells have been located. Cotell is 30 miles south of Copper river. A body of coal was discovered near the same place recently.

ARIZONA.

COCHISE COUNTY.

J. G. Hearne of the Black Diamond M. Co., in the Dragoon mountains, Tombstone, says the company's new 200-ton smelter is completed. Reduction of ores will begin when the gravity tramway, 1½ mile long, to be used in transferring the ore, is finished.

Three miles from Bisbee lies the Lone Star group, owned by Pritchard, Evans, Callaghan, Brown and Ingram. The main shaft is that of the Gunsight mine. The shaft is 120 feet deep, with two side drifts, each about 40 feet in length, with an 18-inch vein of silver and copper ore, also carrying lead and gold.

The Copper Queen M. Co. are credited with contemplating the erection of a refinery at Douglas.

COCONINO COUNTY.

The Coconino Sun reports final payment of the purchase price, \$35,000, on the Last Chance mine, in the Grand canyon; owners were Cameron, Berry and Gale. The purchasers were the Canyon Copper Co., J. H. Page manager.

GILA COUNTY.

At Globe the Old Dominion Copper M. & S. Co.'s works are shut down; shortage of coke is the cause. Forty or fifty men will be retained at the mine.

MARICOPA COUNTY.

Seventeen miles from Wickenburg, J. H. Agaard, in the Castle Creek district, who located and partially developed the Fort Henry group of claims, has organized the Fort Henry M. & E. Co. The property is copper and gold. The development work is being done on two leads. One is an iron dike, the ore assaying \$7 gold and carrying copper; on the other lead is a 30-foot tunnel, with a pay streak of copper glance running from 40%.

The Black Rock Co. has twelve men on the Powell & Manchus group, 11 miles from Wickenburg. The mineralized zone is 800 feet in width. In the center is a pay streak 4 feet wide, averaging \$12 free-milling gold. Following this streak, a shaft has been sunk 200 feet and three shifts are running drifts each way, from one of which a crosscut has started. The ore being brought up from the 200-foot level shows the same values as that on the surface.

MOHAVE COUNTY.

The Miner reports the sale of the Leiland-Mitchell group of mines, near Boundary Cone, to Philadelphia and Salt Lake men for \$500,000. A railroad may be built from the Santa Fe, near Franconia, to the mines.

The opening of the ore bodies in the Dixie mines, west of St. George, Utah, causes Kingman to consider belief in a continuous belt, bearing copper ores, across the northern strip of Mohave county. The survey for the railroad from Congress Junction or Wickenburg down the Santa Maria and on to a connection with the Santa Fe at or near Franconia is to begin. The promoter of the enterprise

is F. M. Murphy. The building of this line would open up a rich section of Arizona and lessen the distance between California and central Arizona 200 miles.

J. Howell once had 400 men working on the Hackberry mine, near Hackberry, and will start the mine up again. This mine has a shaft following the incline vein to a depth of 600 feet. The mill on the ground will be overhauled and improved.

The P. & A. mill at Chloride has suspended operations because of lack of water. The Gold Road M. Co. employs fifty men; this number is being added to.

The Elkhart mine at Chloride will be opened several hundred feet below the present workings.

PINAL COUNTY.

F. J. Buck of the Copper Hill M. Co. will erect a leaching plant at the mines, in the Catalinas, near Oracle.

SANTA CRUZ COUNTY.

D. Rooney, manager Red Bird mines, near Nogales, says arrangements are completed by his company to develop the Red Bird mines on a large scale and a good many men will be put to work.

YAVAPAI COUNTY.

Fourteen miles from Prescott the Dunkirk M. Co. is developing a tunnel proposition, where by drifting along the vein something over 2000 feet, beginning at the southwest end of the Dunkirk, where a tunnel is now in 160 feet, a depth of 1000 feet will be gained. There is opened four ore shoots of an average width of from 1 to 3 feet, which show value of \$17 per ton. The company is building a wagon road from the Crown King stage road with a 12% grade down the canyon into Slate creek to their camp, which is at the southwest end of the Dunkirk.

CALIFORNIA.

ALPINE COUNTY.

At Loope a 20-stamp mill is building for the Curtz-Evans M. Co. The company has one 20-stamp mill running and the new mill will be ready to run Jan. 1. The company is working two mines—concentrating propositions, there being little free gold in the ore.

AMADOR COUNTY.

At the Bay State mine the 10-stamp mill is crushing ore from levels seven and eight.

BUTTE COUNTY.

Near Magalia the Nimshew dam and reservoir, now being constructed by the Bay Counties Power Co., will cover twenty-six acres. The dam will be 200 feet on base, 75 feet in height and 700 feet in length. In the base of the dam will be a 45-inch pipe to convey the water; just below the dam there will be a V in the pipe; the water will be conveyed in two 20-inch pipes down to Butte creek. On Butte creek the electric plant will be constructed; the water will have a fall of about 1000 feet. About fifty men are employed at the reservoir and about the same number on the pipe line and plant.

CALAVERAS COUNTY.

On the 21st and 22d inst. Angels will duly celebrate the advent of the Sierra Railway.

B. Thompson, manager project to bring the waters of the Stanislaus into Murphy and Angels, says the survey is completed. Next comes the work of constructing the ditch.

At West Point, in the mine operated by Groves & Lloyd, is a vein 3 to 4 feet, showing free gold.

At the Reliance mine a 5-tank cyanide plant is in.

The electrical machinery at the Bluejay mine, one of the properties of the Fanny Marie Co., is operating the Burleigh machine drills at the rate of 8 feet per day; about 750 feet more of the tunnel will have to be run, when the vein will be tapped at a depth of 900 feet.

At the Fanny Marie, at Glencoe, grading for the 10-stamp mill is finished; erection of the mill will soon begin.

HUMBOLDT COUNTY.

The Orleans Bar G. M. Co. has about mined out Graham's hill and is now shoveling in around the boxes, making a final clean-up. The company will then work some other part of its holdings there.

KERN COUNTY.

(Special Correspondence.)—W. W. Bradbury has a 13-inch ledge of good ore on the M. Free mine, after going through 50 feet of old works and one shot into virgin ground.

The Huiskamp M. Co. has temporarily shut down on account of breaking their machine drill. They expect to start work on the Comet again in a few days.

The Puritan M. Co. expect to start up the Mayflower soon.

Considerable new locations have been made in that vicinity lately.

Bakersfield, Sept. 17.

Though Kern county oil is low in price just now, seven companies operating in

the county paid \$10,000 in dividends in August. Since the first of the year nearly \$50,000 has been paid in dividends by oil companies in Kern county.

The 10-stamp mill and the concentrating plant of the Standard S. & R. Co., at Val Verde, were started up last Monday and are working most satisfactorily. The stamps weigh 900 pounds each.

D. C. Monroe is manager White Horse M. Co., Walker mining district, 8 miles east of Prescott. Superintendent Legge has a shaft down 250 feet on the Hammer mine, with 4 feet of sulphide ore in the bottom. It will be continued to the 500 level.

At Crowned King the Oro Belle mine is working two shifts in the tunnel and has its dam across the Humburg completed. The Lincoln is running its mill.

The Jerome News says that the Equator M. & S. Co. will erect a smelter on their property on Equator hill. The site is being surveyed.

At Lynx creek, Superintendent Berrie of the Hudson G. M. Co. has free-milling gold ore uncovered in shaft No. 2 of the Alice mine. The ore body is 5 feet thick; the ore runs \$20 per ton free gold.

At the Iron King, Superintendent Blanchard of the American M. Co. has shaft No. 1 down 116 feet, with a crosscut of 145 feet; shaft No. 2 is of an equal depth. A crosscut has been driven across the ore for 174 feet. A new hoist is being installed. A 20-stamp mill and rolls and a fifty-ton cyanide plant are projected.

The Consolidated Mines Co. at Randsburg are driving a crosscut tunnel through Rand hill to cut several ledges. They are in 185 feet.

In Radamacher the Wissahickon G. & C. Co. of Philadelphia has bought eighteen claims and will put men to work.

MADERA COUNTY.

A strike is reported in the Gambetta mine, Grub Gulch, the ore milling \$160 to the ton. The shaft has been sunk 800 feet. J. E. Porter is superintendent, J. Keith foreman.

NEVADA COUNTY.

The South Idaho mine is to be worked by the Idaho G. M. Co. Directors: J. E. Carter, J. H. Neff, J. Sonntag, C. E. Clinch, P. W. Mitchell, R. Noel, J. M. Thomas.

The Shady Creek mine has been bonded to C. Graham.

T. B. Gambel tells the Union that on the Yuba mine, 6 miles from Washington, the Yuba Con. M. Co., which owns seven claims on the Yuba river, will erect a 20-stamp mill on the property, and that he will employ forty men there.

The Osthuma G. M. Co. has been organized at Nevada City; J. T., D. E. and F. S. Morgan, W. F. Englebright, D. Richards.

The St. Gotthard M. Co. has opened the old Delhi ledge and is working on ore, under the direction of Superintendent Kartschke.

Odgers & Sons are pushing work on their property on Banner hill, and have a 20-foot ledge that assays \$10.50.

The Eddy M. Co. has incorporated, W. W. and L. R. Kirkham, E. A. Moore, E. J. Morgan, D. P. Waite, and will work the property on the hedrock near Nevada City.

Three machine drills are now in operation at the Murbie mine.

The Mohawk mine, near Graniteville, is working a 6 foot ledge.

At the Omaha mine sinking on the shaft will continue for a distance of probably 500 feet.

Near Grass Valley the Bullion Con. G. M. & M. Co. employs forty men. The Bullion three-compartment shaft is down 1150 feet.

SAN BERNARDINO COUNTY.

The Ludlow & Southern Railway runs from Ludlow south 7½ miles to the Bagdad M. & M. Co.'s mines, standard gauge, to haul ore to the Barstow mill.

SHASTA COUNTY.

The I. T. G. M. Co., 6 miles west of Delta, will put in a 4-inch gravity tramway 900 feet long.

The contest case of W. C. Bruson against the Ruby Hill C. M. & S. Co. has been postponed until December. The Ruby Hill Co. has filed an application for patent to the Monogram quartz mine, located in Section 16, Township 34 N., Range 3 W., and containing 160 acres. W. C. Bruson claimed 440 acres of Section 16 and filed a protest against the granting of the patent. He claims that he was at one time offered \$300,000 for the land, but refused.

The smelter for the Great Western G. Co., at Copley, will be shipped next week.

SIERRA COUNTY.

At the New Independence mine, Wolf Creek, W. Simmons, who has succeeded C. M. Root as superintendent, has sixteen men at work. By Oct. 1 the new mill will be finished; meantime the old 8-stamp mill

is used. The ledge is 7 feet wide and prospects well, showing free gold.

TRINITY COUNTY.

The Three Peaks mine, on Coffee creek, is sold to J. J. Chambers, representing the Great Western G. Co., for \$20,000. The Three Peaks is located near the Nash hydraulic mine and carries free-milling gold ore.

P. Joyce, former superintendent Center Star mine, Rossland, B. C., is interested in the Mason & Thayer group of ten claims, adjoining the property of the Jennie Lind & Maple Co. There are about 1000 feet of work on the property. The exploration is limited to two drifts, which have three ore shoots carrying ore which runs from \$15 a ton.

At the Three Peaks will be put up a 10-stamp mill for the Three Peaks G. M. Co., J. J. Chambers of Redding general manager.

TUOLUMNE COUNTY.

The new 10-stamp addition to the Republican mill is approaching completion. A run of 1000 tons of rock is being made at the Clio mill.

The Shawmut has hung up its stamps. The Mazzeppa, near Stent, is grading for a 20-stamp mill. The Nonpareil mine has been bonded to San Francisco men.

YUBA COUNTY.

The California Debris Commission wants proposals for building portions of barrier No. 1 in the Yuba river, 12 miles east of Marysville. Contract will be awarded Oct. 16 at noon. To ascertain nature of work and terms, address Lieut. R. P. Johnston, Flood Bldg., San Francisco.

COLORADO.

Denver papers say that A. P. Knight of New York city has been in that city for the past month endeavoring to effect a consolidation of all the big mines of the Cripple Creek district, the Colorado Springs and Cripple Creek district railway, the Colorado Midland, the Midland Terminal railway and the Portland mill. The United States Reduction & Refining Co. and the Telluride Reduction Co. had been considered in the deal, but the lines were subsequently drawn so as to exclude the two latter corporations. The plan is locally stated to comprise incorporation of a \$50,000,000 stock company, in which the half dozen leading mines of the Cripple Creek camp, the three railroads, and one, and possibly the three mills, would receive pro rated allotments in proportion to the cash value of their assets; little money to change hands, the only consideration being the actual amount of cash needed to effect the incorporation and pay any incidental expenses. At the consummation of the deal all stock in the new corporation to be pooled for one year, during which time the new management would take over the several and diversified properties, and readjust a plan of their handling, in order to bring their handling down to a more economic and profit-earning basis. Nearly all the concerns mentioned have been approached by Mr. Knight, by whom the scheme has been explained quite elaborately in private. The central idea of the merger is to carry out the trust theory in connection with Cripple Creek, but this will in all probability not succeed. There are obstacles in the path of such a scheme which, from what has been learned already, will render Mr. Knight's work futile. The New York promoter holds that the mines, railroads and mills have identical interests and should be run in the closest of connections. If the mines can be handled at low running expenses, they can produce more ore, earn more money, pay more dividends; the railroads, instead of charging exorbitant haulage rates, can work in conjunction with the shippers and deliver the ores to the mills, where treatment will be made at a nominal figure. As all the values come from the mines themselves (neither the railroad nor the mill being a producer of new wealth), it behooves the management to let the mines earn as much money as they can, since the profits will be divided up any way. The idea is to do away with duplicate and wasteful labor both in the mine, the railroads and at the mills. But the plan seems destined to defeat.

That the scheme has been talked of is indicated, however, by the fact that several of the mine owners and others admit they have been approached. J. T. Millikin, president of the Golden Cycle, said in this connection:

"Yes, I was approached about a month ago by a man who said he had come out from New York to effect, if possible, a consolidation of all the big mines of Cripple Creek with the railroads and mills handling Cripple Creek ores. I told him if he would take a balloon, go to heaven and consolidate the stars and come back, I would talk business with him."

Such was Mr. Millikin's laconic reply in discussing the deal.

A president of another large Cripple

Creek mining company said: "I do not think the scheme is in any way feasible. What is the use of our mining into a big stock company that may or may not pay dividends in the long run, when we know what we have and are getting our regular dividends right along."

A third president said: "I have been approached, but I want to tell you they can have my mine when they pay cash for it. I am not going into any great big stock deal, I tell you. I would rather manage my own property."

A representative of the United States Reduction & Refining Co. said they had never heard of the scheme until they saw mention of it in the Denver papers.

Representatives of the Short Line, the Midland and Midland Terminal, denied any knowledge of the deal, and stated that they had not even been approached.

BOULDER COUNTY.

The enterprise attracting the most attention at Eldora is the tunnel of the Revenue Development Co. on Bryan mountain. Starting at a point 75 feet above the channel of Middle Boulder creek it is designed to pierce the mountain for 6000 feet at an average depth of 900 feet.

The Gypsy Queen, Western Belle and Mother lode claims below Cleora, 5 miles east of Salda, have been sold to the Montezuma G. M. & M. Co.

Near Magnolia, the Corona G. M. Co. has bought the Black Cloud, St. Joe and fifteen other claims, comprising the Gold Hill group. The work has been placed in charge of J. P. Clark. Forty men are now employed on Black Cloud and St. Joe alone.

CHAFFEE COUNTY.

The Mascot M. & M. Co., composed of Illinois and Salda parties, has acquired the Mascot property, near Turret, and has let a contract for 1000 feet of work.

CLEAR CREEK COUNTY.

Near Georgetown, Superintendent Old has a three compartment shaft 285 feet from the Victoria tunnel to the C level to explore at greater depth the ore bodies of the Mendota vein.

Manager Branham of the Centennial mine has a 4½-foot breast of borinite ore assaying 20% copper, 860 in gold and \$15 silver.

The Atlantic mill, on Middle Clear creek, will be operated as a custom plant by F. Reed of Idaho Springs.

The Marshall-Russell and Royal companies on Miller mountain have crosscut 250 feet, cutting four lodes. The Royal tunnel, now in over 200 feet, has crossed several veins, one a 14-inch streak that carries free gold. Power for the drills employed in both bores is furnished by a large compressor.

Georgetown has notice from the smelting trust of an increase of \$3 per ton in smelting charges, or treatment, on all ores of a gross value of \$18 or under. The extra charge will have the effect of shutting off the sale of this kind of ore. However, very little ore of this grade is produced in these districts, the majority of the ores of this class being cobblings heretofore left on the dumps when the ore was assorted for shipment to samplers.

A mill run from the Haggart & Co. lease on the Altitude, or Colorado Central mine, 8½ tons, returned 48% lead and 737 ounces silver, or about \$370 per ton, the two wagon loads being worth over \$1600 each. There were 26½ tons of second-class ore, which ran 238 ounces silver, or about \$120 per ton. The entire shipment brought \$5886 net, after deducting freight and smelting charges. The lease is on the bottom level of the mine, 1000 feet deep under the surface, and is the production of the lease for one month, with five men stopping ore. The block of ground in this lease is 100 feet long and extends from the 1000 to the 850-foot levels. The ore shows gray copper, ruby silver and polybasite. The pay streak averages 3 feet wide.

The machinery for the Argentine tunnel of the Waldorf Co. is now in position.

Production is being made from the Santiago, recently bonded for \$175,000 to Denver men. Two drifts are being driven and two winzes sunk, with pay ore in sight in each.

Near Georgetown, the newly organized Elkins M. & M. Co., that owns the Terrible group, will develop. It is expected that 300 men will be actively engaged at the mine within a year. Mine and mill machinery, comprising a 14-drill air compressor, a 150 H. P. engine, the equipment for a large new mill, 5000 feet of water pipe, necessary water wheels, etc., will be put in. The mill will be erected at the tunnel entrance and the railroad will be related to the mine.

At Yankee, R. A. Hall talks of building a complete and independent railroad, owning its own rolling stock and appurtenances, to connect with the C. & S. either at Central City or Idaho Springs. The Fall River canyon would furnish a grade, and whether this movement is successful or not it is only a question of time

when a railroad will take this route to develop the Yankee Hill territory.

The Royal M. & T. Co., Miller mountain, near Empire station, in its tunnel has a \$15 vein for milling.

FREMONT COUNTY.

A 175-foot drift has been driven on the Era tunnel by the Montezuma G. M. Co. at Barnes City, west of Canyon City. A 45 foot crosscut is now being driven which has tapped a porphyry formation.

On the Empress of India lode assays give \$6 in gold, \$20 in silver and 10% copper, a total value of \$46.20. One hundred and forty men are employed on the property.

GILPIN COUNTY.

The Running Lode property, east of Black Hawk, in August produced 170 tons of concentrating ores, which went to the Newton mill at Idaho Springs. The production of smelting ores was 80 tons, which went to the local sampler and to the Denver smelters, averaging \$100 per ton. There are fifty men at work; T. Dunstone superintendent.

T. Tonge has been visiting Russell gulch and tells the Times that, while high-grade smelting ore is met with in paying quantities, the importance of the district rests, he thinks, mainly on the large bodies of medium and low-grade ore, and the tonnage output depends on the facility with which such medium and low-grade ore can be mined, handled and treated. The values in such ores cannot be satisfactorily saved by the stamp-amalgamation process in vogue in Gilpin county, but by concentration and the smelting of the concentrates it is thought that a saving of from 90% to 95% of the values can be effected. There is only one concentrating mill in Gilpin county, and that of only thirty tons daily capacity. There are a number of concentrating mills on South Clear creek, near Idaho Springs, running on "custom" ores, but no one of them is large enough to handle a big tonnage. In a comparatively direct line, the mills near Idaho Springs a distance of 5 miles from Russell gulch, can only be reached by crossing the intervening divide of over 9000 feet, and the wagon haul costs \$1.25 a ton. On the 6th inst. he saw a wagon load of ore leave one of the mines in Russell gulch for Idaho Springs, drawn by twelve powerful horses, that number being necessary to haul it to the head of Virginia canyon, from which point four of such horses are sufficient to take it down to the mills. The alternative of this route is to send the Russell gulch ore on the Gilpin County Tramway to Black Hawk, unload the same from the Tramway cars into the railroad cars and thence by the Colorado & Southern Railroad to Idaho Springs, a total distance of 17 miles, the total freight being \$130 per ton. The great need of Gilpin county in general, and of the Russell gulch district in particular, is the erection of a large concentrating mill, built and equipped on the most up-to-date principles and comprising the most modern improvements. The only available site for such a mill is on North Clear creek, higher up the stream than all the present stamp-amalgamation mills, and therefore having clear water. This site is convenient to the lower terminus of the Gilpin County Tramway, by means of which the ore could be collected from the shafts of the Russell gulch mines, conveyed down hill almost by gravity and dumped automatically from the ore cars into the bins at such concentration mill, at a cost not exceeding 40 cents per ton, as compared with the present rates of \$1.25 and \$1.30 between mine and mill. The company erecting and operating such a mill should also own large properties containing practically unlimited quantities of the right kind of ore for the supply of the mill, so as not to be dependent on "custom" ore. When opened up and operated in connection with such a mill, the Bimetallic and King Bee groups in Russell gulch could alone produce a minimum of at least 1000 tons of ore per day of the minimum average of say \$10 per ton, which could be mined and dumped into the cars of the Gilpin County Tramway at an average cost of not to exceed \$1 per ton, carried by the Tramway to and dumped into the ore bins at such mill at a cost of 40 cents per ton, reduced at such mill from four tons of crude ore into one ton of concentrates worth \$35, at a cost considerably less than \$1 per ton on the crude ore. Such concentrates would cost from \$1 to \$1.50 per ton (i. e., at the rate of 25 to 35 cents per ton on the original crude ore) to haul by railroad to the smelter, and \$3 per ton (i. e., at the rate of 65 cents per ton on the original crude ore) for smelting charge, leaving a minimum net margin of profit, after allowance for loss in concentration and other contingencies, of at least \$5 per ton of crude ore, which on the basis of a minimum of 1000 tons per day would mean a net margin of profit of at least \$5000 per day for the operation of the above-mentioned two

groups and the concentrating mill. On "custom" ore, of which there would be an ample supply available, the minimum charge could be \$1.25 per ton and the maximum charge \$1.50 per ton.

GUNNISON COUNTY.

Near Gunnison, the Colorado Mines Con. M. Co. has its mill on the Cachetopa creek completed. The Standard & Sterling tunnel is in 1000 feet.

Superintendent Welch of the California-Colorado S. M. & M. Co. says his company will build a large mill at the Ruby Chief mine in the Irwin district to handle the low-grade ores.

R. H. Terhune has completed a run on 1500 tons of ore at the Tomichi valley smelter at Cosden. The Southwestern smelter at Whitepine is to be remodeled by Manager Muther.

Gunnison reports the Augusta Metal M. Co.'s Pittsburg tunnel into Augustum mountain 1500 feet, the remaining 1100 feet to be completed next season. The property is daily producing from the upper workings, the Dark canyon tunnel, twenty-five tons of ore; packed by jacks to Anthracite, loaded on the trains to the Pueblo smelters. When the new tunnel is completed the packing of ore will cease, as a wagon road reaches it. The company anticipates a heavy output of ore on the completion of the tunnel, enough to furnish a mill with 100 tons daily, besides shipping 25 tons per day.

The Colorado M. Con. Co. will soon have its concentrating mill on the Cochetopa creek completed, treating the ores from the Sterling and Standard lodes daily; it has a capacity of fifty tons. The tunnel, which develops both properties, is now in 1000 feet, showing ore the entire distance. A shaft is to be sunk in the tunnel 500 feet from the breast. It goes down on 5 feet of ore.

LAKE COUNTY.

A company is developing the Arizona place on Empire hill, Leadville.

The Leadville News-Dispatch says the pumps at the Valentine mine began work in first-class condition. The pump in the shaft has been there over a year and a half and it was a question whether it would work or not when the steam was turned on. At the first effort, however, it began work faultlessly and is throwing sixty gallons of water per minute. The pumps on the Morocco and Bon Air mines are throwing large streams of water, and in a week the Morocco shaft will have been unwatered.

Manager Jones of the Cloud City Co. is making preparations to resume work by Oct. 1st. The California Gulch people are also considering the proposition of resuming work as soon as the Morocco and Bon Air shafts can be pumped out.

At Leadville, the new mill at the A. Y. & Minnie mine is running on low-grade mineral mined on their property. The A. M. W. mill is also operating on low-grade tonnage from that property.

The Yak tunnel is producing from 150 to 300 tons a day of all classes of ore and is being pushed ahead toward the Ihex ground.

LA PLATA COUNTY.

Durango reports a strike in the Porcupine 3500 feet west of the Neglected shaft, on the same vein. The ore is from 2 to 4 feet wide and is the same in its detail as the Neglected. The Porcupine has a tunnel 350 feet long, and the strike, by survey, has a depth of 1700 feet greater than the lower workings of the Neglected. The ore assays \$100 in gold.

MESA COUNTY.

J. V. Howard says that in ninety days two reverberatory furnaces will be in Grand Junction, and by January 1 two blast furnaces, with 200 tons a day capacity, will be treating ore.

OURAY COUNTY.

The Picket mine, 7 miles southeast of Ouray, Uncompahgre mining district, is sold to G. L. Bradley of New York for \$40,000. It is a smelting ore. Mr. Bradley is general manager Revenue Tunnel Mines Co.

PITKIN COUNTY.

At Aspen, the Mollie Gibson mine, once the greatest silver producer in Colorado, has closed down. The property is said to have passed into the control of a Cripple Creek banker.

ROUTT COUNTY.

Near Steamboat Springs the Verde M. & M. Co., 3 miles north of the Colorado line, is putting a plant of machinery on a promising copper-gold lead. The ore is high-grade copper, carrying some gold. E. Hinton is manager.—The North Fork M. Co. S. Edgar manager, is working two shifts on a contact vein 3½ feet in width of copper and gold ore. By sorting, the ore will stand the wagon haul to Laramie.—J. E. Love, resident manager Comstock M. & M. Co., North Fork of Snake River, has three veins which carry copper, lead and gold. One vein is 8 feet

wide. A crosscut tunnel 200 feet long has been run, and when run another 200 feet will cut the farthest vein at a depth of 300 feet.—The Wyoming C. & G. M. Co., C. R. Henderson manager, is placing machinery on the Scott claims.—The Primrose M. & D. Co. of Denver has a three years' lease on the Elkhorn mine, ½ mile south of the Wyoming-Colorado line.—The Three Forks M. & M. Co. has a silver and lead property 60 feet north of the Colorado line. They have 2½ feet of ore that averages \$40 per ton.

SAN JUAN COUNTY.

The Silverton Standard reports ten stamps arriving for the Silver Wing mill, near Eureka.—Gray copper and steel galena from the north drift of the Hercules, Prospect basin, Mammoth T. & M. Co.'s property, give returns of \$6 gold, 650 ounces silver and 30% lead.—B. Zan has a contract for 600 feet of tunnel for the Sioux M. Co. When this contract is completed, power drills will be placed by the company, which will continue the 1100-foot hole to the Toltec vein.

A test shipment of good grade ore has been sent to the Kendrick-Gelder Smelter from the Idaho, on Kendall mountain—the first ore sent from the Idaho in many years.

The New York-Brooklyn mine, near Chattanooga, has returns from a carload of ore which netted them about \$3100—an increase in the value of the ore of more than 100%, the previous shipments having netted about \$45 per ton.

The first carload of ore shipped from the upper workings of the King group of mines over the new tram has been sent to the smelter. The lower tunnel is progressing. On the King purchase this week another \$40,000 was paid on the purchase price by Mr. Kinney, the president of the Royal M. & I. Co., to Herr & Woods.

A 10-stamp mill at the Brooklyn mine, near Chattanooga, is to be in operation before the snow comes. The low-grade ore from the mine is being saved; the high grade is being shipped to the Durango smelter. The average production of this smelting ore is three cars per week; values run from two to three ounces gold.

SAN MIGUEL COUNTY.

A. B. Frenzel writes the Journal that he will soon be in Telluride. For a year he has been in Europe making experimental tests in his vanadium ores and promoting a company for development of the property, and has been successful. He has a group of vanadium territory 15 miles from Telluride.

SUMMIT COUNTY.

A. M. Gillaspay has molybdenum ore from Ten Mile district, near Robinson. Four claims are sold to Boston parties engaged in the iron and steel trade. Tests show the crude ore to contain from 10% to 40% molybdenum and some gold. It can be concentrated to produce 50% molybdenum.

TELLER COUNTY.

Cripple Creek says the grade of the ore in the Golden Cycle property is increasing in value. That is the biggest low-grade proposition in the district; the average value of the ore broken runs about \$18. The increase during the last month shows that the shipments are averaging \$20 to the ton. The increase of \$2 per ton amounts to \$7000 a month profit to the company, as they are shipping 3500 tons of ore each month.

Cripple Creek continues to discuss the water problem. It is now proposed to organize a pumping association to operate in the northern end of the camp, where the water course cut by the Standard tunnel some years ago was drained down to that level to drive a tunnel to connect with the 600-foot level of the El Paso, which is about 225 feet below the Standard tunnel, about 4200 feet long. While this work is in progress, a drive would be made to the north to cut the known water course. If water should come in too rapidly, it should be bulkheaded until connection can be made with the tunnel. When the water is drained down to the 600-foot level the El Paso shaft could be sunk deeper and another level extended over to the water course. It is figured that, as the lift would be short, a powerful pumping plant could handle it more economically than if it had to be raised to the surface. This tunnel would strike the Elton mine at 945 feet and the Mary McKinney, Anchoria-Leland and Gold King at considerably greater depth than they are now able to work without employing heavy pumps.

The Xerxes and Ernestine Cos. have a leasing plan that is in some ways new. They throw open their territory to leasers upon the following terms: First year, no royalties at all; second year, 15% royalty; third year, 20% royalty. The plan of leasing without royalty is favorably received, being an inducement to leasers on undeveloped property of prospect companies. If followed out, some of the local

concerns which own good patented territory will be able to have it developed. A second provision which might be made would be to grant any lessee opening ore an extension of six months or a year on his lease.

J. R. McKinnie has sold the controlling interest in the Squaw Mountain M. & M. Co. to H. L. Coe & Co. of Springfield, Mass.

The new \$75,000 equipment of the El Paso Con. G. M. Co. is in operation.

Good ore is coming from the south end of the Black Belles property.

The initial shipment from the recent strike in the Mary Cashen gives good returns.

Recent development at the Wild Horse property on Bull hill makes it among the greatest producers of high-grade mineral in Cripple Creek.

A small shipment of El Paso ore, 470 pounds, returned values at the rate of \$19,275 per ton. This mine produced 760 tons during July, the gross receipt for which was \$51,298.42.

H. H. Barbee has been appointed local business agent of the Princess Alice Con. G. M. Co.

The Stratton's Independence, Ltd., Co. may cease operations on the property and lease the entire territory.

A body of \$20 ore has been opened by a leasing company operating the Gladstone on Globe hill.

Development work at the Shurtleff No. 2 on Bull hill shows that the strike on that property is an important one.

The Practical Leasing Co., operating on the Trachyte, has opened another body of ore.

The Bedford G. M. Co. has begun work on the Ocean Wave claim of the Little Puck Co., Squaw mountain.

IDAHO.

BOISE COUNTY.

The World says that J. T. Grayson, who bought the gold mine, at Quartzburg, has bought the Iowa group of five claims east of the Gold Hill for \$60,000. He will begin work this fall on the Gold Hill. The water was pumped out of the mine last fall. The shaft is 400 feet deep. There is now 150 feet of water in the shaft.

The shaft on the Last Chance mine, at Quartzburg, is down 250 feet, 100 feet below the level of the creek. It is turning out good ore. Besides the free gold, the vein carries sulphurets which run \$60 a ton. The mine is owned by Beary, Clemens & Daly.

IDAHO COUNTY.

E. Luria, of Hamburg, Germany, who bought a half interest in the Baby Louise, at Hump, will put a 10-stamp mill and cyanide plant on the property.

R. M. Sherman, on Siegel creek, 6 miles east of Elk City, 50 miles from Silties and 20 miles northeast of Buffalo Hump, has thirty-five claims, for which much is claimed. One ledge is 14 feet wide and contains a streak of ore 6 inches in width, that widens to 2 feet at the 250-foot level. At this depth the ore values run \$100 to the ton, the remainder of the ledge ranging from \$14 to \$16 a ton.

The Hogan group of mines is owned by Hogan Bros. It lies 16 miles southwest of the Sherman group, 12 miles from Elk City. There are thirty claims in this group, and 160 acres of placer ground. A 20-stamp mill will be in operation next month, the first installment of 100 stamps to be put in.

At Buffalo Hump about thirty stamps are dropping on the Crackerjack and Big Buffalo, owned by C. Sweeney of Spokane, the Wise Boy and the Jumbo. This is a low-grade, free milling camp; all four of the mines are paying dividends and good properties are being developed.

At Dixie, Hogan Bros. of Butte have a porphyry dike property 300 feet wide. They are putting in a 20-stamp mill and if the ore runs even as low as \$3 to the ton it will be a dividend payer.

A fifty-ton cyaniding plant is being installed on the Lincoln group at Neal, owned by Hodson & Kennedy. The Checkmate is dropping ten stamps.

KOOTENAI COUNTY.

(Special Correspondence).—The Dandy mine at Rathdrum have a silver-lead proposition, carrying some gold. They are running a crosscut tunnel 250 feet. It is a concentrating ore.

Rathdrum, Sept. 11.

OWYHEE COUNTY.

Near Silver City, at War Eagle mountain, the Poorman mill has resumed. For years the mill has lain idle. The vein discovered 1100 feet beneath the surface, 400 feet beneath the deepest of the old workings, is the same vein from which so much good ore was taken in the early days. The starting of the mill is for a test run to determine how well the values can be saved with the present equipment. It is expected that changes will be made.

SHOSHONE COUNTY.

(Special Correspondence).—The Empire State-Idaho Development Co.'s Burke mines at Burke are operating the mine with day shift and the mill with night shift, but are not shipping any ore at present. In fact, but one or two mines in the district are shipping any ore. They are all awaiting the action of the American Smelting & Refining Co. If the smelter trust draws the lines much tighter it may mean the closing down of the mines here. Everything is unsettled.

The Hercules M. Co., Burke, are driving a new tunnel, which will be about 2500 feet in length when completed. They will install a compressor plant in the fall. They employ sixty men at present. The ore is galena. H. L. Day is manager.

The Anchor Con. mines at Burke are driving a tunnel on the lead and the indications are very good for some first-class ore. The tunnel is now about 1700 feet in length.

Burke, Sept. 10.

(Special Correspondence).—The Empire State-Idaho Development Co.'s mill at Kellogg has not been shipping any ore for some time. They now have several hundred tons of concentrates ready for shipment.

The Cœur d'Alene Development Co. at Silver King are operating their mill on ore from the Crown Point mine, but are unable to ship the concentrates until a settlement has been made with the smelter.

The Bunker Hill M. & C. Co. at Kellogg are shipping about 100 tons of concentrates per day to the smelters, the trust not being in a position to dictate to them how much they can ship and how much they will pay the mine for the product. The Bunker Hill Co. are now taking some ore out through the new tunnel, which is nearly completed and which will do away with the aerial tramway running from the mill over the city of Wardner. The tunnel is about 2 miles long. Ed. Kellogg, Sept. 13.

W. Powers of Mullan has a contract for 800 feet of tunnel work in the Reindeer mine, near there.

The decision of Warren Truitt, master in chancery for Judge Beatty on the accounting in the Hanley case, is to be filed with Judge Beatty soon. Kennedy Hanley has been awarded an eighth interest in the Skookum mine at Wardner, owned by the Empire State-Idaho M. Co. and he is suing for over \$300,000, which he claims as his share of the ore mined in the past. Suit was recently brought by C. Sweeney and the Chemung M. Co. to have Kennedy declared the holder in trust for the Chemung M. Co. of the eighth interest in the Skookum, which he purchased. W. B. Heyburn, representing Mr. Sweeney and the Chemung Co., has filed an application before Judge Mayhew to have a receiver appointed for any money which might be paid Hanley by the Empire State-Idaho Co. on account of his eighth interest. The receiver, it is urged, should disburse the money of the Chemung Co. Another development lately has been the application of Mr. Heyburn for the Empire State-Idaho, to amend his original answer, so as to set up the claim that the ledge involved in the Skookum case does not have its apex in the Skookum ground. The case has gone past the United States Court of Appeals to the Supreme Court of the United States.

Murray hears that the Simmons group has been bonded to J. K. Clark of Portland for \$150,000, a payment of 10% made.

The Stewart M. Co. has been organized to develop and sell the ores from the Senator Stewart mine at Kellogg; A. M. Strode of Mullan, A. Benicks of Wardner, W. N. Morphy, C. Kallem and N. W. Thornton of Wallace.

MICHIGAN.

HOUGHTON COUNTY.

At Houghton, an over-hoist in the Red Jacket shaft of the Calumet & Hecla shattered the cage, which fell back into the shaft. The rope parted and the entire 8000 feet went to the bottom. No one was injured and but little damage was done to the shaft. The friction was so great from the passing of the rope over the sheaves that they took fire.

MISSOURI.

JASPER COUNTY.

Joplin reports a record breaking week in tonnage of lead sold. At Aurora the assay basis was cut \$1.50 per ton to \$34.50, and there were no takers for the ore even at that reduction. In Joplin and Oronogo offerings were \$1 per ton less, while at Prosperity and Duenweg prices were practically unchanged. In several instances in Joplin, where one buyer made an offer of \$1 less, the seller secured the same price from another buyer by declining the cut. The assay basis for the bulk of the best ore is strong at \$35 for 60% zinc, while

other ore sold at \$34 and \$33, as it graded down in quality.

The steady high price for lead ore is causing some operators to turn their attention more to this product, the price continuing firm with active demand at \$49 per ton. During the corresponding week of last year the highest price paid was \$26.50 per ton, \$11.50 per ton less than the past week, and lead sold at \$46.50 per ton, \$2.50 less. The shipment was greater than the past week by 622,100 pounds of zinc, but less by 390,900 pounds of lead and \$46,880 in value. For the corresponding thirty-six weeks the shipment this year was less than last by 2,595,980 pounds of lead, but greater by 13,817,130 pounds of zinc, and in value \$1,126,755.

MONTANA.

DEER LODGE COUNTY.

Danielsville reports that the mines at that place will start next week, and that in a short time the mill now building will be ready to receive ore. Travel between Danielsville and Anaconda is large.

FERGUS COUNTY.

Lewiston reports placer gold discovered on Fish creek, a tributary of Little Bull river; 3 miles have been located during the past week. That gold exists in the beds of many of the rivers of southeast Kootenai in considerable quantities has been proved. The latest discovery in the district is that of Violet, Dore & Armstrong on Fish creek, 12 miles south of Fort Steele. Spokane men may put in a dredging plant and work the ground for a sixth interest.

At Kendall, J. R. Cook has bought a half interest in the Arizona and Stand Pat claims. R. Clark has bought the Mountain Rat, Elkhorn and Blacktail claims. The Elkhorn M. Co. will be organized.

MADISON COUNTY.

The Watseca mine at Rochester employs 114 men, the mill fifteen men. The Elgin mine is working a large force. E. W. Merritt expects to soon have men at work on the Longfellow mine.

The mill at the Montana mine at Sheridan was partially destroyed by fire last week.

MISSOULA COUNTY.

A. P. Johnston of Superior says that more claims have been located in that section and near Cedar creek this year than in any previous twelve months, and that development work is going on extensively.

PARK COUNTY.

Anthracite coal has been found in the Boulder mining district near the mining camp of Contact. The discovery was made by A. Cooper, a prospector, in a gulch near the Milwaukee & Standard M. Co.'s mines.

NEVADA.

ELKO COUNTY.

F. Smith, from Jasper, brought 150 bars of silver and lead, the product of a run of the new smelter installed by C. Spence. The smelter has closed down and the miners have been laid off. As soon as there is an increase in the water supply, operations will again begin.

EUREKA COUNTY.

Ore shipments by rail from Eureka district for the week ending Sept. 12 were as follows: Excelsior mine, 45,180 pounds; Eureka Con., 44,870. From Hamilton—Rosso-Homestake, 104,870.

HUMBOLDT COUNTY.

At Lovelock the Enterprise M. & O. Co., C. Floranden secretary, has incorporated and acquired two properties, one in Troy canyon, 5 miles south of American canyon, and the other in Fisher canyon, 2 miles farther. Each is a placer claim.

LINCOLN COUNTY.

The new 500-ton mill of the DeLamar Co. is about completed.

NYE COUNTY.

E. Lande, L. H. Jackson, F. and R. B. Bain, C. E. and E. W. Elliott and J. P. Allen are the directors of the North Tonopah M. Co., incorporated on the 16th inst.

The Gold Hill ledges parallel those of the Mizpah and the Valley View; the property joins the Valley View on the south. A part of it lies between the two claims of the Tonopah & Salt Lake Co. The main working shaft is down 200 feet. The property is owned by J. L. Butler, Brounger Bros., T. L. Oddie and J. W. McCulloch.

The Miner says samples of ore from the late strike at the 440 level of the Mizpah Extension shaft, on the east side of Mount Oddie, give values of \$9 per ton gold and two ounces silver.

The Gold Mountain M. Co. is incorporated at Tonopah. It owns eight claims discovered in Gold mountain by C. Runge and will run a tunnel that will cut the surface vein at a depth of 300 feet.

In Liberty camp, 25 miles northeast of Tonopah, ore is found at the deepest

workings—500 feet—that assays 200 ounces silver per ton. Twenty-five miners are employed. The company is contemplating reduction works.

The shaft of the Montana-Tonopah Co. is projected to go 1200 feet.

STONEY COUNTY.

The Con. Cal. & Virginia M. Co. has received \$2972.89 in gold coin as proceeds of the sale of four railroad carloads of ore to the Selby Smelting & Lead Co.

In the Gould & Curry mine, on the 425 level, the northwesterly drift from the main west drift is in 242 feet. The face is in porphyry and quartz, the latter assaying \$5 per ton.

In the Utah Con. mine the raise started in the north drift from surface tunnel No. 2 has been carried up 12 feet; total height, 12 feet. The top is in ore showing value by assay of \$4.75 per ton.

The water in the Chollar combination shaft on the Comstock stands 160 feet 2 inches below the measuring point in that shaft, having fallen 3 inches during the week. This is the lowest the water has been since pumping under the present system began at the C. & C. shaft. At the latter shaft hydraulic elevator No. 1 has been in steady operation for some time past, except when stoppages were made to save pressure water, and the mine water is easily held at a short distance below the 2150 level station.

In the Justice mine, during the past week, in the north drift from the top of the upraise above the 370 level, they have been cutting out for square sets and have saved 16 tons and 180 pounds of ore, averaging \$14.29 per ton by car sample assay. In the north drift, 100 feet below the 600 level, they have started an upraise at a point 60 feet in from the winze and have advanced the same 10 feet. From this upraise they have saved 5 tons and 830 pounds of ore, averaging by car sample assay \$32.91 per ton.

In the Mexican mine the west drift on the 1600 level is out 88 feet. The face is in porphyry, with stringers of quartz and seams of clay.

On the 1600 level of the Union shaft the joint Union Con. and the Sierra Nevada crosscut started at a point in the main west drift 765 feet from the main station is in 360 feet. The face is in clay and soft porphyry. The south drift from the main west drift on this level is in 581 feet south of the north line of the Union Con. mine, with soft porphyry and clay in the face.

Drill hole No. 2 on the Brunswick lode is down 706 feet, with the bottom in quartz and porphyry.

The official letter from the Savage mine says: 425-foot level from the Gould & Curry tunnel—the north drift on the fifth floor of the upraise above the north drift from No. 2 east crosscut has been driven 18 feet during the past week through porphyry and low-grade quartz. The face is now in quartz assaying from \$5 to \$15 per ton.

WHITE PINE COUNTY.

L. P. McCreary has a bond on ten mining claims on the east side of White Pine mountain, agreeing to pay \$5000 for the same before August 19, 1907.

NEW MEXICO.

GRANT COUNTY.

Lordsburg reports the sale of the Comanche group of mines in the Burro mountains to J. S. Curry of Ironwood, Mich., C. J. Laughren, Escanaba, Mich., T. J. Atkinson, Charles Humphrey, Ironwood, for \$105,000. A leaching plant of 200 tons capacity is to be erected on the property. Lordsburg says a smelter of 200 tons capacity to treat the copper ore will be built at Lordsburg and a railroad is to be built to a connection with the Southern Pacific or the El Paso & Southwestern.

The copper ore of the Michigan-New Mexican Copper Co., Virginia district, near Lordsburg, assays \$12 gold, \$3 silver and 8% copper. The company is building a 30-ton concentrator, to be in operation December 1.

Shipments of lead and iron ore from the Granite mine at Stein's Pass have been temporarily prevented by recent rains.

S. W. Winn, manager Mineral M. Co., is determining upon methods of working the company's properties, Stein's Pass district.

J. B. Dibble of the Lena M. & C. Co., Lordsburg, will have the Miser's Chest unwatered.

TAOS COUNTY.

W. Fraser, superintendent Fraser Mountain C. Co. at Twining, is daily producing three tons concentrates, which will be matted when the smelter is order. The product will be matted on the Atlantic coast. The smelter has a daily capacity of 126 tons. About seventy men are employed in the mines and fifty men with teams are burning and hauling charcoal and coke.

OREGON.

BAKER COUNTY.

Sumpter reports that C. C. Pratt of Portland has in operation on Powder river, near Wind creek, a gold-saving plant that is designed to eliminate the cost of handling ore or gravel, and in the saving process, utilizes the water running through his sluices as power to operate the machinery required. He expects to save the fine free gold and sulphurets found in the tailings of that stream. A dam to direct the water through his sluices, his patented rifles, a concentrator operated by the water running through the sluices, and newly patented amalgamating process, constitute the appliances.

DOUGLAS COUNTY.

Near Glendale, the Cuines Creek G. M. Co., J. P. Rhodos, superintendent, has a 3-foot ledge of \$6 ore, developed by a 400-foot tunnel.

The Benton group, west of the Gold Bug, comprises nine claims. Developments are by four tunnels. The mine is being equipped with new machinery. R. A. Jones, superintendent.

JACKSON COUNTY.

L. B. Chase is developing the Palmer mine at Jacksonville.

Superintendent Morris of the Fish Lake Ditch Co., Jacksonville, says he can give employment to a number of men at \$2 a day.

A tunnel is to be driven at the Simmons & Cameron hydraulic mines, Waldo, to give way for a sluice and give access to a placer bed that cannot be reached in any other way. The tunnel will be 1250 feet in length, through solid rock. The managers of the Simmons & Cameron placers is putting in a hydraulic elevator and a new and larger pipe line on the Illinois river.

The Gold Bug, Mt. Reuben district, is having its equipment doubled by the addition of new boilers, hoists, compressors, engines and pumps. The Gold Bug is opened by tunnel and shaft 500 feet. Ore values run \$18 per ton in free gold and concentrates. The latter are treated by the cyanide plant. The tailings are cribbed up and run through the cyanide plant. S. Cole, is superintendent.

JOSEPHINE COUNTY.

The suit of E. McCann against the Althouse M. Co. resulted in no damages for plaintiff. The suit was to restrain defendant in the operation of a placer mine, and from damaging McCann by flowing water over his land and depositing mining debris and slickens. Judge Bellinger of the Portland U. S. Circuit Court held that plaintiff is not entitled to such relief, and the complaint was dismissed. The water used in the operation of the mine is taken from Althouse creek by a tunnel through a divide that separates the waters of that creek from Democrat creek. McCann owns 425 acres of land, which he values at \$10,000, and he complained that the water from the mines is filling up the channels of Democrat creek and the water is spread over his land, rendering it boggy and unfit for cultivation. Judge Bellinger reviewed the evidence at considerable length regarding the fact that witnesses for McCann testified that fifteen acres were covered with debris; others said ten acres. On the other hand, twelve witnesses—farmers, miners and others—testified that there is no debris on the land in quantity to injure it, and thirteen other witnesses testify to the same thing. Before starting the mine, the superintendent offered to levee all the low places on McCann's land, and offered to pay \$50 per acre for the land, and both of these offers were refused, and also an offer to repair a ditch running through the land. The preponderance of evidence, the court held, is against the claim of injury and damage, and the refusal of McCann to permit the defendant to build a levee along the ditch and improve it and keep it in repair, the court said, was unreasonable.

The Snelling-Alfred quartz mine, Galice Creek district, has been bought of C. Bradbury by men who will drive along tunnel to tap the ledge at greater depth.

LANE COUNTY.

High-grade ore from the Helena mine is hauled to the terminus of the railroad and shipped to the Tacoma smelter. The 10-stamp mill is crushing the free-milling ores from the upper tunnels. The Musick 10-stamp mill is in operation.

SOUTH DAKOTA.

LAWRENCE COUNTY.

F. T. Sanders of the Jupiter G. M. Co. is building a 100-ton cyanide plant at the Gustin mine, Blacktail gulch, 3 miles from Deadwood.

At Cyanide, camp of the Spearfish M. & M. Co., the Black Diamond No. 2 cut represents the summer's work, 325 feet in length; a slope, 50x100 feet, averaging 10 feet in height with three openings. The old work, Black Diamond No. 1, lies 1000

feet from this line, in reserve for winter work. Previous work on this ground has gone 450 feet into an 800-foot ore body, vein averaging 10 feet. Other work reserved for winter is on the Metallic, which lies within 150 feet of the cyanide plant and has been proved up, 35,000 tons having been taken out. The company will relay the track at the present work with thirty-pound rails. Black Diamond No. 2 is 2 miles from the mill.

The Gold M. Co. is drilling for quartzite at the Goodman shaft in Johnson gulch. The depth is now 275 feet.

The cyanide plant of the Deadwood-Standard, in the Ragged Top mining district, which has been closed down, is running again, 125 tons a day, and made a first clean-up on the 15th. Thirty men are working in the mine. T. R. Dunham of Deadwood is chemist; S. B. Morrison is superintendent. The work is principally surface work, with considerable prospecting.

The Kildonan cyanide plant of the Horseshoe Co. at Pluma is being increased from 100 to 300 tons a day. This was originally a chlorination mill and was converted to the cyanide process last spring. A new building is to be erected on the sidewalk above the present main building, and this, with the old roaster and cooler rooms, will be used as tank rooms. The tanks are to be of steel.

The August cleanup at the Kildonan mill resulted in a brick worth \$15,000, which was shipped to the main office at Milwaukee, Wis., last week. This represented the gold recovered in thirty days at the rate of 100 tons a day. This plant is receiving only the low-grade ores from the Horseshoe Co.'s Ruby basin and Bald mountain mines.

At Terraville, in the Pocahontas mill, formerly known as the Deadwood-Terra, the Homestake Co. is making renovation without closing the mill down. Twenty stamps are taken out at a time, and new foundations, mortars, battery posts, guides, etc., are put in. The interior of the mill will be virtually new. The new clarifying plant, the improvements on the Pocahontas and cyanide No. 2 are to be finished simultaneously and the whole in operation October 10.

PENNINGTON COUNTY.

At Rapid City the Horseshoe M. Co., owning the National smelter, will start it up next month. E. M. Holbrook, general manager Horseshoe M. Co., has been elected president National Smelting Co. Anson Highy, general superintendent of the company, is at Rapid City, supervising the renovation of the plant, preparatory to blowing in the furnaces. The Horseshoe Co. is making daily shipments of ore to Denver and other outside smelting points. These will continue the purchase of ore, the National smelter being intended only to increase the amount of ore treated.

E. C. Johnson, superintendent Gertie M. Co., has placed boilers, engine and other machinery at the shaft in Hill City. Sinking has been resumed to make the shaft 520 feet deep. The Gertie is the oldest mine in the county.

The Spearfish M. & M. Co. at Creston report the August production from that mine \$23,000. The entire process of mining and milling is performed on the property, the product being finished as gold bricks. The mining is carried on directly in the face of the bluff, the entire slope of the hill being allowed to fall after the tunneling has removed the mineral. A steam railroad traverses the property, carrying the ore into the mill.

YANKTON COUNTY.

At Gayville the Homestake cyanide No. 2 will be finished about October 15. In some respects cyanide No. 2 will be an improvement on cyanide No. 1 at Lead.

UTAH.

BEAVER COUNTY.

Superintendent Farnsworth of the Horn Silver, at Frisco, says sixty persons are employed, forwarding 200 tons a month to the smelters. He is sending out ores which maintain an average of 26% copper and others made to average 45% lead, with some silver and gold.

J. Fergie of Milford is manager Lady Curzon group, owned by the Beaver C. & G. Co., North Star district.

BOX ELDER COUNTY.

At Park valley the Century is now operating sixteen stamps. Richer ore is being opened up as work progresses. A good showing is being made in the Sunrise mine in its crosscut for the vein.

GRAND COUNTY.

Near Basin, Hammond & Thomson will do tunnel work on the Little Dot. The ore will be shipped by wagon out to Cisco and to Salt Lake City for reduction.

JUAB COUNTY.

In the Lower Mammoth at Eureka Superintendent Ball has connection with the west fissure on the 1100-foot level, and

is driving to tap the shoot on the 300-foot level. Two cars of ore from the new channel sold on controls showing 106 ounces silver, 5.4% copper and 80 cents gold—\$58.53 per ton.

The contract system has begun at the Centennial Eureka. The tramway, which has been idle for some time, has started up.

The Tribune hears that the management of the South Swansea of Silver City is arranging to start up again.

SAN JUAN COUNTY.

At Montecello, the Golden Dream has ores in value \$17 per ton. Manager Riggs has gone to New York to meet his company, to plan for extensive operations.

SUMMIT COUNTY.

The Nalldriver group, Park City, may be worked by Manager Rood of the Ontario.

At the California, Park City, Superintendent Gitsch has an ore body into which he has driven for 80 feet and a winze dropped for 20 feet. Average milling ores, 19% lead, seven ounces silver, 80 cents gold per ton; assays on the shipping ore, 70% lead, seventeen ounces silver and 80 cents gold, with the zinc reduced to 1.6%.

Supt. Brooks will double the capacity of the concentrator of the California M. Co. at Park City, to handle an average of 120 tons of crude ore daily.

The Park City Record reports the Anchor shaft completed. Foreman McSorley says the 500, 700, 1200 and 1400 levels will be developed on toward Bonanza Flat. The completion of this shaft enables the largest cars, double-deckers and all, to go up, enables the company to handle its coal, etc., through the Anchor tunnel and shaft, and puts the mining property in shape for economical and advantageous working. Material for the 300-ton mill is arriving and men are framing timbers for the structure.

TOOELE COUNTY.

The Sunshine mines and mill at Sunshine has gold dust from its cyanide plant of the value of \$6400, proceeds of a two weeks run, during which an average of 220 tons a day were put through.

Near Ophir, Superintendent J. W. Cairns of the Eureka-Ophir Con. mine has a 15 H. P. gasoline engine in operation. A postoffice is to be established there to be called Gisborn.

At the Four Metals mine in Dagway district, G. L. Moats, manager, the shaft is down 400 feet.

The Tribune notes the payment of \$45,000 by which control of the Galena King Co.'s mines at Stockton passed into the hands of Wisconsin men, of which D. McVichie is the resident representative. The properties, that a total of nearly \$100,000 has been required to buy, adjoin the Honerine at Stockton. Participating with D. McVichie in the purchase are J. H. Knight, J. C. Cochrane of Ashland, Wis., and I. Wing of Bayfield, Wis. The shaft by which the group has been opened is at a depth of 825 feet; it will be retimbered.

WASHINGTON.

FERRY COUNTY.

At Republic, the Zala M. Co. is hauling fifteen tons of ore per day to the Kettle Valley lines for shipment to the Granby smelter.

Regarding Republic, G. Pfunder states that shipping from resumption of work has created a better feeling. Ore from Republic will be shipped to the Granby smelter at Grand Forks, the B. C. smelter at Greenwood, the Standard at Boundary Falls and the Everett at Everett. He states that the highly siliceous nature of the Republic ores will make it difficult to secure an outlet for large tonnage at the present time, but he is satisfied that the experiments in reduction now under way will result in the evolution of a process best suited to the reduction of ores. Personally he is convinced that this process will consist of a preliminary roasting such as is practiced at Cripple Creek, Colo., followed by a crushing and cyaniding. Boundary smelters are giving Republic ores a \$5 rate for freight and treatment and Everett's rate is \$6, the difference being accounted for by the longer haul.

STEVENS COUNTY.

J. F. Hall has an option on the Frisco, Monarch and Big Strike quartz claims, on Fish creek, 12 miles from Boundary City.

WYOMING.

CARBON COUNTY.

At Grand Encampment the aerial tramway is about completed. The contract says the tramway is to be in operation Oct. 1.

The railroad survey from Encampment to Hog Park, via the South Fork of the Grand Encampment river, has begun.

Building the piers and laying the foundations for the concentrator is completed.

W. Bunce, the new superintendent Ferris-Haggarty mine, is inspecting the

workings at the mine and planning future development.

FOREIGN.

BRITISH COLUMBIA.

The Mines Exchange, Ltd., Nelson, under date of Sept. 13 reports that the 1902 returns from the Rossland camp will show a marked gain over last year. The sudden revival of interest is likely to affect the production from the camp which has of late averaged 5000 and 6000 tons weekly, to an output of 10,000 to 12,000 tons for the rest of the year. The Great Northern and C. P. R. are both prepared for heavy shipments with increased facilities now on the spot.

At Nelson the Ore Hill group on Sheep creek, owned by G. Birtsch, is to have a 5-stamp mill on the property.

H. Z. Beck, manager Camborne group, reports the right of way for the aerial tramway from the Gold Finch rich gold ore to the 10-stamp mill at Goldfields completed. Laying the cable is in progress. Men are erecting the stamp mill.

Shipments from the Rossland camp for the week ending September 13th and for the year to date are as follows:

	Week.	Year.
Le Roi.....	3,180	160,621
Le Roi No. 2.....	1,650	46,551
Center Star.....	1,612	9,232
War Eagle.....	961	3,546
Rossland G. W.....		2,400
Glant.....	200	1,945
Cascade.....		300
Columbia-Kootenay.....		30
Bonanza.....		90
Velvet.....	60	610
Spitzee.....		20
White Bear.....		5

Totals.....7,663 225,350

The Co-operative S. & R. Co. will erect a smelter 1 mile away from Golden, and thus will probably transfer the population of that place to the new townsite.

SOUTH AFRICA.

Rhodesia reports in June seven mines in operation; seventy-two stamps; total ore milled, 22,484 tons; average duty per day, 4.85 tons per stamp; total tailings cyanided, 13,761 tons in five plants; total yield in gold bullion: Mill, 12,923 ounces; tailings, 2528 ounces; miscellaneous, 91 ounces; total, 15,842 ounces. For the six months ending June 30 the total yield was 99,049 ounces crude, equal to 88,153 ounces fine gold, \$1,822,122.

THE KLONDIKE.

The Yukon Government is preparing to erect a stamp quartz mill for testing ores. For the first two months it will be free to miners. The Ladu Co. has ordered a 100-stamp mill which will be installed at the Lepine quartz mines, 15 miles from Dawson.

Dawson advices say that the Yukon Council has passed a labor law for the benefit of miners. Under it their wages will take precedence over everything save mortgages on record prior to its passage. The lack of such a law has been a great drawback as far as the miners were concerned. They have lost considerable in wages due from laymen, as neither claims nor output were held for wages.

Obituary.

At Colorado Springs, Colo., Sept. 14th, W. S. Stratton, owner of the Independence mine, Cripple Creek district, died after an illness of several months. He was born in Jeffersonville, Ind., July 22, 1848. He was educated in the schools of that city, and at the age of 17 took up the carpenter's and draughtsmen's trade, which he mastered. He had resided in Colorado Springs for thirty years. During all that time he had been interested in mining, being a prospector in various camps of Colorado as long as fifteen years before he opened the Independence bonanza. In April, 1891, having seen some specimens of gold ore from the Cripple Creek district that impressed him favorably, he went to that camp to prospect. On the 3d of July, after weeks of fruitless prospecting, a man who had agreed to grub-stake him having disappointed him, Stratton decided to go to Cripple Creek and stake out a claim on his own account. He rode the 35 miles from Colorado Springs to the camp on horseback, and on the morning of the 4th of July, 1891, staked out the Independence and Washington claims. The Independence gave him original assays of \$380 to the ton, and in 1892 he leased and bonded the Washington for \$80,000. The Independence yielded Stratton millions, and in 1898 was sold by him for \$10,000,000, he retaining a considerable interest after receiving the sum. He was a man whose private charities were boundless, and his interest in the public welfare without limit. His wealth is estimated at \$15,000,000.

Personal.

L. N. PARKS has charge of the Folsom, Cal., gold dredger.

S. A. BARRON is manager Federal smelter, El Paso, Tex.

E. L. GODBE has charge of the April Pool mill, De Lamar, Nev.

C. TIMMONS has returned from British Columbia to Prescott, Ariz.

N. GILLIS of Salt Lake, Utah, is examining mining property in Japan.

B. ROSS has resigned as manager Bertha M. Co., Idaho Springs, Colo.

LEE COCHRANE of the Mine & Smelter Supply Co. has gone to Mexico.

VICTOR M. CLEMENT has gone to New York, and goes thence to Mexico.

ROSS E. BROWNE has returned to San Francisco from Santa Barbara, Cal.

H. H. HICKS succeeds H. J. Sisty as superintendent Hite Con., Cal., mine.

W. MITCHELL succeeds H. Witteborg as manager Breckenridge, Colo., sampler.

M. B. KERR has been appointed manager Jumper mine, Tuolumne county, Cal.

F. M. DAVIS of the F. M. Davis Iron Works Co., Denver, Colo., is at Coronado, Cal.

J. K. FINDLAY, has been appointed manager Portland M. Co., Cripple Creek, Colo.

E. E. NOON is superintendent the Santa Rosalia mines, Arizpe district, Sonora, Mexico.

J. PENMAN is superintendent Verde Grande mines, near Hormosillo, Sonora, Mexico.

W. A. FARISH will take charge of the Majestic Co.'s smelter, Milford, Utah, Sept. 28.

C. PORTERFIELD is succeeded as manager Charlotte M. Co., Red Cliff, Colo., by C. W. Smith.

H. W. TURNER has returned to San Francisco from an inspection of mines at Eureka, Nev.

MR. WILLIS G. DODD is now vice-president of the Union Iron Works of San Francisco.

O. M. ROBERTS is general manager La Mina Henrietta, La Cienega, Altar district, Sonora, Mexico.

T. ELLIOTT, superintendent Smuggler mill, Telluride, Colo., has returned there from a northern trip.

F. F. SHARPLESS, formerly of the California Copper Co., is in charge of the Com. M. Selection Co., Honduras, C. A.

C. H. WITTENOOM, manager Millar's Karrie & Jarrie Co., West Australia, is inspecting Colorado mining conditions.

W. J. JOHNSTON, publisher Engineering and Mining Journal, has returned to New York after a ten days sojourn in California.

MANAGER A. BURCH of the Bunker Hill & Sullivan mines, Cœur d'Alene, Idaho, has returned there from Salt Lake, Utah.

PHILIP ARGALL and A. J. WARWICK have returned to Denver, Colo., from an examination of the Rosario mine, Guadalupe y Calvo, Mexico.

HENRY T. SCOTT of San Francisco has gone to New York City to take the chairmanship of the executive committee of the shipbuilding combine.

J. W. CHANDLER has resigned the superintendency of the Midas mine, Deep Creek, Utah, and will develop the St. Louis group, Nevada City, Cal.

S. LOEB, general superintendent; L. Glockner, superintendent ore department, and H. R. Jones, shift boss, Independence mine, Cripple Creek, Colo., have resigned.

LEO VON ROSENBERG of New York has gone to the west coast of Mexico and to Lower California, Mexico, to examine gold mining properties for New York people.

J. J. CHAMBERS has been elected vice-president of the Great Western Gold Co., Redding, Cal., in place of T. S. Henderson, resigned. Mr. Chambers retains the office of general manager.

C. W. L. FILKINS is the new professor of mining engineering at the Golden, Colo., State School of Mines. W. E. King has the chair of metallurgy and mining. C. R. Rose will have charge of the assay department.

Catalogues Received.

"Power Transmission Appliances," a handsome twenty-page booklet, with fine illustrated description of "Globe" hangers, post boxes, shaft couplings, pulleys, etc., manufactured and furnished by the Globe Iron Works, Stockton, Cal.

Latest Market Reports.

SAN FRANCISCO, Sept. 19, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 51½c, refined (1000 fine); San Francisco, 51½c; Mexican dollars, 43½c San Francisco, 40½c New York.

The coinage executed at all the mints of the United States in August, 1902, amounted to \$10,487,110, of which \$8,040,000 was in gold, \$2,236,000 in silver and \$211,110 in minor coins. All the gold coinage was executed at the San Francisco mint. In addition, there were coined \$225,000 in five-bolivar and \$69,583 in two-bolivar for the Government of Venezuela, and \$231,944 in fifty-centavo pieces for the Government of Colombia.

COPPER.—New York: Standard, \$11.00@11.40; Lake, 1 to 3 casks, \$12.00; carload lots, \$11.60; Electrolytic, 1 to 3 casks, \$11.60; carload lots, \$11.40; Casting, 1 to 3 casks, \$11.50; carload lots, \$11.25. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £53 13s 6d spot per ton.

H. L. Casey, metal broker of New York, predicts that the maximum price for copper for the next three years will be about 12 cents per pound, as, according to his figures, the surplus stock of copper on hand in America Sept. 1, 1902, amounted to 220,469,760 pounds, and will not induce Europeans to bid very high for such a surplus. Mr. Casey states that the production of copper during the past five months has increased 18.12%, as compared with a corresponding period in 1901.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 18s 9d per ton.

SPELTER.—New York, \$5.50; St. Louis, \$4.50; London, £19 7s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$26.35; San Francisco, ton lots, 29c; 1000 lbs., 29c; 500 lbs., 29c; 200 lbs., 29½c; less, 30c; bar tin, 3½c. London, £121 15s spot.

PLATINUM.—San Francisco, crude, \$18.00 ½ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 ½ flask of 76½ lbs.; Denver, \$49.65. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 19.50c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ½ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22 50; gray forge, \$20.50; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31 and \$31.50; open hearth billets, \$33 and \$34; San Francisco, bar, 7c to 12c per lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.00; Brymho, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$13.00; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c ½ lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 68% B, 2c ½ lb.; soda ash, \$2.00 ½ 100 lbs.; hyposulphite of soda, 2½@3c ½ lb.; blue vitriol, 5½@6½c ½ lb.; horax, concentrated, 7@8c ½ lb.; chlorate of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 2½@2½c; California refined, 2@2½c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3@4c ½ lb.; Cal. s. soda, bbls., \$1.25 @1.50 ½ 100 lbs.; s. s. soda, bbls., \$1.25 @1.50 ½ 100 lbs.; s. s. soda, bbls., \$1.25 @1.50 ½ 100 lbs.; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c ½ lb.

OILS.—Linseed, boiled, hbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; lots of 5 bbls., 1c less; Lucol oil, hbl., 50c; cs., 55c; raw, hbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs., 25c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 hbl., 95c; cs., \$1.05; Neatsfoot Oil, hbl., 70c; cs., 75c; No. 1 hbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, 4c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c ½ lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, ½ lb., 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) ½ lb., \$1.25.

MERCURY.—Bichloride, ½ lb., 90c.

MOLYBDENUM.—25c. ½ gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) ½ lb., 80c.

SILVER.—Chloride, ½ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ½ lb., \$1.00.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c.

ZINC.—Dust, ½ lb., 10c.

ZINC.—Sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Commercial Paragraphs.

THE Simonds Saw Co. has moved to the new four story and basement brick building 31 Main street, San Francisco, with increased facilities for handling the stock of saws, pulleys, Morse pumps, etc.

THE Pennsylvania Salt Manufacturing Co. of Wyandotte, Mich., has purchased a number of direct-current motors from the Westinghouse Electric Manufacturing Co., for installation in its plant at Wyandotte.

THE New York office of the Colorado Iron Works Co., Denver, Colo., has closed a contract with O. A. Turner for a 40-stamp amalgamating mill for the Mojave G. M. Co. of Arizona, 14 miles from Needles, Cal.

THE Krogh Manufacturing Co. of San Francisco is building an 18-inch patent hydraulic dredging pump for the Hackett dredger, which will be used for deepening the hay channel and for filling work. They also manufacture these pumps for gold dredgers. The Hackett dredger has a capacity of 350 cubic feet of solid material per hour, and is similar to one called the Olympia, installed by the company for the West Coast Dredging Co., which has made the longest continuous run of any on this coast. The company is also making changes on the Merritt, another of the West Coast Co.'s dredgers. Two 60 H. P. boilers and steel casings are to be added.

In the annual report of the American Smelting & Refining Co., submitted at the recently held annual meeting of the stockholders, the gross earnings for the fiscal year ended April 30, 1902, are computed at \$7,038,681, which compares with \$5,988,049 in 1901, a gain of \$1,150,632. After deducting fixed charges, which called for \$2,177,062, there was a total surplus of \$4,251,968, an increase of \$361,619. The earnings by quarters were as follows: First quarter, \$1,510,710; second quarter, \$1,728,392; third quarter, \$1,795,222; fourth quarter, \$2,004,357. The surplus after preferred dividends is equivalent to less than 3% on the common stock. The total net surplus is equivalent to about 6% on the common stock.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING SEPTEMBER 9, 1902.

708,691—OIL BURNER—G. W. Arper, Oakland, Cal.
708,697—LETTER RECEPTACLE—D. F. Bennett, Redding, Cal.
708,693—HYDRAULIC NOZZLE—P. Bouery, Weaver, Cal.
708,755—ELEVATOR—M. A. Clennam, S. F.
708,586—GAS GENERATOR—E. R. Cook, Sacramento, Cal.
708,696—PACKAGE—E. H. Davis, Mesa Grande, Cal.
708,826—ELEVATOR—L. W. Dexter, San Jose, Cal.
708,820—WINDOW SHADE CARRIER—A. W. Ellis, Sumpter, Or.
708,702—BOX FASTENING—E. Fletcher, S. F.
708,632—REGISTER AND ALARM—L. E. Fugate, Seattle, Wash.
708,975—BAKERS' OVEN—C. E. Glafke, Los Angeles, Cal.
708,693—PERFORATING PIPES—E. R. Graham, Bakersfield, Cal.
708,707—KILN—Gray, Gray & South, S. F.
708,708—ELECTROSEPARATOR—A. W. Harrison, Los Angeles, Cal.
708,881—BORING MACHINE—B. E. Harvey, Ritzville, Wash.
708,826—GAS GOVERNOR—D. E. Hodges, S. F.
708,893—OIL BURNER—C. G. Lundholm, San Bernardino, Cal.
708,896—SPRING HINGE—E. Mathis, Miles, Or.
708,908—RAILWAY RAIL JOINT—T. C. McLin, Seattle, Wash.
708,899—CAR FENDER—E. C. Moulton, San Jose, Cal.
708,913—HAT—A. Olson, San Diego, Cal.
708,594—MESSAGE BOX—A. F. Shriver, Arbuckle, Cal.
708,671—TELEPHONE MONTH PIECE—Smith & Woolsey, S. F.
708,975—PHOTO CARD MOUNT—P. J. Stuparich, S. F.
708,976—HARNES—J. T. Surbaugh, Arbuckle, Cal.
708,978—OIL BURNER—O. Tillman, San Jose, Cal.
708,599—AMALGAM TRAP—G. R. Tuttle, Grass Valley, Cal.

SPECIAL MEETING.

A Special Meeting of the Stockholders of the MAY DAY GOLD AND SILVER MINING COMPANY, a corporation, will be held at the office of the Company, at Heald's Business College, No. 24 Post St., San Francisco, California, on Wednesday, the 8th day of October, 1902, at the hour of 1:30 o'clock P. M., for the purpose of voting for the voluntary dissolution of said corporation.

By order of the Board of Directors.

E. H. STEARNS, Secretary.

H. E. SKINNER CO.
416 Market Street, San Francisco.

Firearms and Sporting Goods.

Whole No. 2201.—VOLUME LXXXV.
Number 13.

SAN FRANCISCO, CAL., SATURDAY, SEPTEMBER 27, 1902.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

USUALLY in the case of a broken crankshaft from a gas engine, it breaks at the junction of the cheek with the shaft on which is placed the flywheel, and always gives the appearance of a flaw, there being a bright place showing a fresh break, and a larger, smooth portion, showing an old break, which, to a casual observer, looks just like a flaw. On the cheek this break appears as a cup-shaped indentation, the shaft showing a projection which snugly fits into the depression in the crank. It looks as though the shaft had been welded into the cheek and only a part of it properly done, and that the shaft has held on with only a very small section. But these shafts are not welded, being forged from a solid piece of steel. As a matter of fact, the ordinary cause of this

View of the Works of the Mount Morgan Mine, Queensland, Australia. (See Page 174.)

breakage is the lack of proper adjustment of the engine by the operator, causing the engine to work against itself, which starts a slight check or crack at the juncture of the cheek and the shaft. This crack gradually works around the shaft and inward, and, as it does so, naturally, the oil from the engine follows and in the vibration of the crankshaft causes the break to wear smooth. After a while the break has worked in so far that there is not enough of the steel left to stand the strain, and it breaks, this last section of the fracture showing bright; the greater part of the break, appearing old and smooth, gives the whole thing the look of a flaw, when it is really only an old and long-continued crack, which has been for some time working in farther and farther.

TABLE OF CONTENTS.

ILLUSTRATIONS.—View of the Works of the Mt. Morgan Mine, Queensland, Australia; Top of Mountain, Taken from West Side, Mt. Morgan, Showing System of Timbering by Means of Square Sats, Queensland, Australia, 171. Gamhetta Mine, Madera, Cal., 176. Mining and Metallurgical Patents, 178.

EDITORIAL.—Broken Crankshaft From Gas Engine, 171. Railroad to Angels, Cal.; Relation Between Electricity and Magnetism; Gold Dredging on This Coast; Evolution of the California Stamp Mill; Royalties at Cripple Creek, Colo.; First Blast Furnace on the Pacific Coast; Interesting to Silver-lead Miners; Arrangement Between the Cœur d'Alene Silver-Lead Miners and the Smelting Trust; The Day of the Poor Man in Mining, 172.

LATEST MARKET REPORTS—183.

MINING SUMMARY.—172-183-181-182.

MISCELLANEOUS.—Concentrates, 173. The Treadwell Mine, Alaska; The Mt. Morgan Mine, 174. Notes on Machinery Constituting a Mining Plant, 175. Of Historic Interest, Present Cyanida Practice, 176. The Gold Production of North America, Its Geological Derivation and Probable Future; Strike at the Gamhetta, Cal., Mine; Rock Drill as Blacksmith Hammer; Water Measurement in the Yukon, 177. Mining and Metallurgical Patents, 178. Personal; Commercial Paragraphs; Books Received; Catalogues Received; Obituary, 183. New Patents; Notices of Recent Patents, 15.

The advent of the railroad this week into the old historic town of Angels, Cal., exemplifies the new era in California gold mining, and the advance from "the days of '49," when that locality was made famous in song and story. The vicinity of Angels is still turning out gold in 1902, as in 1849, the only difference being that deep quartz mining supersedes surface mining, and the building of a railroad to that town fittingly emphasizes its continuous richness and importance.

A FINE ILLUSTRATION of the relation between electricity and magnetism is afforded in the current of electricity produced in a wire moved in the vicinity of a magnet. What is called a field of magnetic force exists between the two poles of a horseshoe magnet. A loop of wire so disposed that it will revolve within such field will have an electrical current generated therein. On this fact or effect rests all modern dynamos and motors, from the 5000 H. P. generator at Niagara to the little generator in the telephone.

ABOUT six years ago gold dredging on this coast was made a prominent subject and that evolutionary process of gold mining began to take on considerable proportions. In California, Colorado and Oregon, as in Montana, dredging for gold has now made the yield of gold so produced a factor of some importance in the annual gold output, and areas that Chinese forsook twenty years ago are now affording handsome profit. From the Cœur d'Alenes come accounts of installation of gold dredgers, and the field is widening. No form of gold mining is on a surer basis. With care in the selection of ground, proper sampling of the whole area proposed to be dredged, and skillful operation of the proper dredger, the element of chance is almost wholly eliminated; the matter sifting down to a commercial proposition of cost, expenses and net profit.

THERE is a constant discussion in British Columbia, interesting to silver-lead miners everywhere, as to what producers there shall do under certain conditions, those conditions being the U. S. tariff and the restriction of the American Smelting & Refining Co. The latest from the northern province is a projected revision of the tariff. There also seems to be hopes of some adjustment of U. S. lead mining conditions as between purchasers and producers that may accrue to Canadian profit, though the latest patched-up arrangement between the smelting combine and the Cœur d'Alene lead miners does not afford much present aid or comfort. There are a few things to be borne in mind. There is no U. S. market for Canadian lead. A European market seems impossible because of transportation and insurance charges. The Oriental market is a peculiar one. There exists a certain limited demand there for a specially

refined lead for native use as "tea lead," this soft, specially prepared lead being largely furnished by the Selby Smelting & Lead Co. of San Francisco and the Broken Hill Proprietary Co. of Australia. The claim that the different lead products can be manufactured in Canada and there find a home market is not borne out by the Minister of Mines' report of an annual production of 60,000,000 pounds of lead and an annual consumption of lead products of 25,000,000 pounds, though in the last project lies largely the ultimate solution of the problem of Canadian mines—what to do with their surplus lead product.

ON page 176 of this issue appears an article solicited from Mr. Irving M. Scott of the Union Iron Works of San Francisco, Cal., on sundry points in the evolution of the California stamp mill as suggested in the issue of August 9th in an article by M. P. Boss, another past grand master in the art. In the article on page 176 Mr. Scott clearly shows the characteristic attention to detail and painstaking effort that led up to the improvement specified. Not the least in interest is his account of the evolution of the amalgamating pan, which greatly adds to the value of Mr. Scott's historic article. We may be pardoned for suggesting that when the manager of the establishment that "huilt the Oregon" can find time to minutely detail matters as he so clearly sets forth, the fact is worth commending to the attention of men who sometimes say they are "too busy" to write. Yet there is probably no busier man in the United States than the author of the article on page 176.

CRIPPLE CREEK, COLO., mining ground owners have been charging good round royalties until lessees on their part have begun to be obliged to gouge the eyes out of the mine in some instances to pay what is required. It is a clear case of supply and demand, and as long as there are three sets of lessees to one piece of leasing ground companies will naturally get all they can from leasers, up to 30% on \$25 ore. But sooner or later that must stop, and it is now becoming a question for all to consider. So far, leased ground on the whole has been worked in minerlike fashion, but if fancy figures must be paid, leasers can not be expected to do the dead work, and development work that always goes with ore extraction in a rightly worked mine. The action of some Cripple Creek mine owners retards the district, hinders development and puts a premium on gophering. In the long run, or short run, this hurts the owners of the property and isn't business. It always pays to treat the other fellow right and give him a chance to make something out of his work.

AT Irondale, 5 miles south of Port Townsend, Wash., the first blast furnace on the Pacific coast was built in 1877, but proved a failure after some years and was finally abandoned by the Puget Sound Iron Co., about twelve years ago. In 1898 the Pacific Coast Steel Co. bought the plant, relined the furnace, put in machinery for crushing and handling the iron ore and operations are resumed. The furnace is 50 feet high, 12 feet in the hosh, 6 feet on the crucible, and has a daily capacity of fifty tons of iron. Four steam hoilers furnish power to drive the ore-crushing and hoisting machinery and the blowers. Hot blast is used, the air entering the furnace through five tuyeres at a temperature of 950° F. The ore is brought on scows 130 miles from Texada Island, B. C., the coke on scows from Skagit, Wash. There is also a charcoal-making plant, twenty kilns, each 30 feet high, 30 feet diameter at the base, capacity seventy-five cords of wood. The kilns are filled with wood automatically at a cost of 54 cents per cord. The operators are producing a good grade of iron with ready sale therefor.

THE arrangement reported on page 180 between the Cœur d'Alene silver-lead miners and the smelter trust is a mutual compromise and concession, as such arrangements usually are, though some present advantage seems to have been gained by the miners. The policy of the smelter combine has been to reduce the Cœur d'Alene output in an effort to sustain the lead market. Idaho producers frankly told the smelter combine that if more satisfactory terms could not be secured the result would be an independent smelter and refinery, with the result as detailed on

page 180. It is believed, however, that this arrangement only partakes of the nature of a temporary truce, and that sooner or later silver-lead producers in the Cœur d'Alenes, Colorado, and elsewhere must work out their deliverance in the manner previously outlined herein. Under present conditions the natural order of things is reversed. While the Bunker Hill & Sullivan sends its ores to this coast, the rest of the local lead mines are dependent upon the combine. Naturally, and in a general way, lead smelting is made subordinate to lead mining. As things are in relation to the smelter combine, smelting is the one great controlling factor, production itself being merely secondary and incidental. The miners have little to say; the smelter monopoly sets the price, makes the terms of contracts, buys or refuses to buy and acts just about as the principal part of the business—mining itself—would act; a case of the tail wagging the dog. It is as if a draughtsman in the employ of a mining machinery company were to get to such a point as to be able to dictate what the prices and terms of sale of machinery should be. Of course, this is a condition not in accord with the basic principles of business and one that can not permanently go on. The main point lies in the manifest fact that where the minor becomes the major premise in a business argument or arrangement such arrangement is unfair, and, therefore, can not last, for no man or men will stand having the worst of a bargain if they can help themselves, and as in this case they can help themselves, and really have the strength of the game, they will not endure having the market value of their mines and products controlled and regulated by the smelter monopoly just as completely and effectually as the smelter combine controls and regulates its own investments.

It is being said in many Eastern journals and not a few Western ones that the day of the poor man in mining is gone by; that no one but a big corporation can succeed in mining any more; that it takes big capital to do anything; that most of the good mining propositions are controlled by trusts or millionaires and that there is no longer opportunity for a man with a little money. This is all a mistake. The day of the "poor" mining man was never brighter nor greater than right now. If he be a gold miner he can get supplies of all kinds 50% cheaper than he could a generation ago, while he will get just as much per ounce for his gold as when everything he used cost just twice what it does now. Every old miner will hear us out in that statement. The cry that no one but a big corporation can succeed now is no truer now than it was fifty years ago, when, if an adventurous miner wanted to turn the head of a California river or bring water 20 miles or turn a hill upside down, he had to do just what miners of this generation do—combine to get enough money to make the thing a go. The complaint that it takes big capital to do anything is given contradiction by the flat fact that countless good mines from Republic, Wash., to Bisbee, Ariz., are owned and worked profitably by the men who prospected them from the start, these mines having paid their way from the grass roots. The assertion that most of the good mines are owned by trusts or millionaires is heard most often, but there is least in that of any of the pessimistic utterances. One hears of the big millionaire owners more than he does of the thousands of substantial companies that go right on with little notoriety paying good wages and monthly yielding dividends. Finally, it may be justly said in answer to the assertion that opportunity no longer exists for the man with a little money, that never in the world's history were there finer opportunities in mining for the man with a little money than in this west half of America to-day. In the one State of California it was recently figured that there were 17,000 "prospects," undeveloped mines, unmade—for mines are made—awaiting a little more to make them profitable. Doubtless were a similar census taken in other American commonwealths, there would be a proportional aggregate. Of course, not all of these, not probably one in ten would or could be developed into a "going" mine, but the opportunity exists for the man with moderate capital, and opportunity is all that the go-ahead man has ever asked any time, anywhere. And a little capital coupled with good judgment, as against "big" capital and no judgment or skill, will win in mining every time.

Concentrates.

COPPER will slowly combine with mercury when immersed in it. Iron is unaffected by mercury.

Ore giving a return of 10% and less of metallic lead to the ton is usually considered a dry ore, and over 10% a wet ore.

THE percentage of ashes from a given weight of coal is found by dividing the weight of the ashes in pounds by the weight of coal that produced the ashes.

AT 68° F. the resistance of No. 36 B. & S. copper wire is 2414 feet per ohm. It will carry nearly three amperes in the open air without charring the insulation.

IN an air compressor, at 100 pounds gauge pressure, 1 cubic foot corresponds with 7.82 cubic feet free air; at 80 pounds pressure, to 6.46 cubic feet; at 60 pounds, 5.10.

LEACHING of silver ore by sodium hyposulphite is ordinary metallurgical practice. This office furnishes what is considered the best practical work on that subject—Stetefeldt's.

To calculate the horse power of a windmill, approximately, multiply the area of the sails in the plane of revolution by the cube of the velocity of the wind in feet per second, and divide product by 4,000,000.

ORDINARILY a team of horses will travel at a walk 25 miles in ten hours, a speed of 220 feet per minute. A man can load with a shovel about 15 cubic yards—place measurement—of ploughed earth in ten hours.

SIX drilling machines 3 miles from the air compressor would require, approximately, 450 cubic feet free air per minute. If this amount of air is transmitted through a 4-inch line at 100-pounds gauge pressure, the loss would be about 15%.

A **REDUCING VALVE** is about the same thing as an automatic throttle, reducing the steam pressure to any desired degree. This pressure is thus regulated by a spring, or compressed by a screw, or, in other styles, by a lever and weight.

ANTIMONY, arsenic, bismuth, iridium, iron, lead, gold, silver, copper, platinum, mercury, tellurium and zinc have all been found in a native state, the zinc near Melbourne, Australia, the lead at Franklin, N. J., and in the Ray mine, Arizona.

THERE are several great gold producing properties in southern California, among others the Golden Cross in San Diego county; the Yellow Aster, Kern county; the Exposed Treasure, also in Kern county; the Gold Mountain, San Bernardino county; the Dean and Jones, in Inyo county.

FOR station work and for flows of over 1000 gallons a compound pump is most effective. A compound station pump with condenser will ordinarily cost, laid down from \$1.60 to \$2.20 per gallon per minute capacity against 300-foot head, and about 30% more against 400-foot head, from 12 cents to 16 cents per pound weight of machinery.

A **STEAM JACKET** of correct design and properly applied and managed will heat up the cylinder surfaces to the temperature of the steam at boiler pressure, thus preventing the condensation of the inflowing steam both before and after expansion takes place, and in this manner save from 20% to 25% of steam at initial cylinder pressure, showing its value as a fuel saver.

OWNERS of valid mining locations made and held in good faith under the mining laws of the United States and the regulations thereunder are authorized and permitted to fell and remove from such mining claims any timber growing thereon, for actual mining purposes in connection with the particular claim from which the timber is felled or removed.

If a tool dresser is compelled to use sulphurous coal it can be counteracted a little by turning on the blast rather strong, and when the coal is all coked and fairly glowing the blast can be turned off and a piece of iron laid in the fire which will collect most of the sulphur, which he will notice to be a coat of white or yellow on the piece of iron; if necessary, repeat the operation until the fire is reasonably free from the deleterious element.

IN the case of the Bunker Hill & Sullivan Co. vs. Empire State-Idaho M. Co., 106 Fed. Rep., 471, the U. S. Circuit Court for the district of Idaho decided that for the purpose of locating a mining claim with parallel lines parts of the lines may be within another claim, though within the overlaps the rights of the other claim prevail. The senior claim having within its surface a part of the width of the apex owns the entire width of the ledge.

ALL calculations of energy consider rest as the zero of motion. Gross matter is destitute of self-moving force. It is inert. Hence inertia is that property of matter that makes it resist change of position when at rest, or change of direction when in motion, and which requires a countervailing force to bring it again to rest. Inertia is the persistence of mass in any state imposed upon it by force. Force is the cause of energy, and is that which produces motion or tends to produce it.

IT is a little late to institute comparisons commendatory or condemnatory as to the relative merits of electricity and compressed air in mining operations. They are not competitors, but coadjutors. There are cases when either one is better than the other. The point is to determine in the particular case mentioned whether it were more economical or practicable to use water power,

steam, electricity or compressed air, or any two or all, and to let it go at that. From the data presented from the Montana Inquirer steam power would appear to afford the greatest possibility of present profit.

THE WATT, the unit of electrical power, is $\frac{1}{4}$ of a horse power. It equals the mechanical energy represented by 4424 foot pounds. One ampere of current moving under the influence of one volt pressure, or any combination of volts and amperes, and that will make unity when multiplied together, is the equivalent, in the expenditure of energy to the work a man would do in lifting one pound 44.24 feet high, or any work, any weight raised any distance, in which the weight and the distance multiplied together make 44.24.

THE thermometer marks the temperature, but the bulb of quicksilver and the human body are affected differently. As to what feels hot or cold to one is a matter of conduction of heat. Silver, iron, wood and air at the same temperature feel differently. Silver will burn the skin at 156° F. It will blister the tongue at 150° F. Iron to do that would have to be considerably hotter. Wood can be handled when at a temperature of 200° F., and it is on record that men have stood an oven heat of 600° F. for a short time without apparent injury.

IN practice gas engines might be improved by increasing the inlet and outlet passages. The proper mixture of fuel may be tested by placing a pet cock in such a position that it opens directly into the compression space. When this pet cock is open the color of the flame which occurs at the time of explosion will indicate the proper mixture. A deep blue, similar to that produced at the base of a Bunsen burner, indicates that the mixture is about right, but if the edges of the flame are tinged with orange it indicates that the proportion of gas is too great.

CIRCULATION in a boiler is of value and should always be secured to a sufficient extent to keep the heating surfaces bathed in water and to prevent their undue heating and the injury of the boiler through unequal expansion. The more rapid the circulation the better will this end be attained, and some gain is also to be secured through the reduced tendency of sediment to deposit on the heating surface. It is in these directions, and not in any increased evaporative efficiency, that the gain from good circulation is to be found. While in theory rapid circulation should very slightly improve the economy of a boiler, the gain is too slight to be discernible by any practical tests.

IN battery renewal of a sal-ammoniac or a federal salt solution, not more than four or six ounces of salt should be dissolved in each cell filled two-thirds full of water, the old solution in every case being thrown away. Fresh bichromate solution is made by dissolving two parts of water and then adding five parts of sulphuric acid, all by weight. In renewing a copper sulphate solution, the jar with elements inserted, should be filled with clean soft water to within 2 inches of its edge; then small lumps of blue vitriol (copper sulphate) to the amount of eight ounces should be dropped in. If the battery is to be installed in service at once add to the solution four ounces of zinc sulphate which must be pulverized to dissolve immediately.

IF a boiler is tapped below the water line a jet of water will issue from the hole, the speed of which will be determined by the pressure behind it, and the form of orifice made; what this speed is for 100 pounds pressure is found by determining the height in feet of a column of water that will equal the pressure, extracting the square root of it and multiplying by 8. The temperature of water under this pressure in a steam boiler is 328° F., and it weighs 56.89 pounds per cubic foot. Dividing 144 by the weight per cubic foot, and multiplying the quotient by the pressure, shows that it requires a column of water 253 feet high to weigh 100 pounds to the square inch, the square root of which is 16 nearly. Then $16 \times 8 = 128$ feet per second.

IN a diamond drill any variety of diamond free from flaws and not too highly crystalline may be used; but flaws are frequent in all diamonds but the carbonados, and render the stones liable to break under the pressure to which they are subjected in the crown of the drill. A crown will last for about three resettings. By that time it has worn away too much to hold the carbons securely or to maintain the full diameter of the bore. The resettings should be made rather frequently, as it is poor economy to attempt to work a drill that has become worn and weakened. After the third setting the stones are taken out and set in a new crown. A metal bit will carry the boring in rocks of hardness even through an average distance of from 80 to 100 feet. The cost of wear on the iron bit is about 2 cents per foot for holes up to 2 inches in diameter.

THE distance to which signals can be reliably conveyed through pipes in mines is uncertain; straight pipe systems will carry the sound a long way; side branches are less reliable. Experiments have been made in coal mines, using sprinkler pipes put up to lay the dust, mostly galvanized wrought iron pipes, one or two inches in diameter, suspended by wires or hooks, or placed in conduits, and connected by flanges, with rubber packing, or fitted into one another with hemp packing, the branches generally joining under right angles. Using first a funnel-shaped mouthpiece, it was found that the hands were a better help; slowly spoken words thus could be understood at the extremities of straight pipes 1600 feet long, especially when the pipes were firmly fixed. Whistle signals were much less distinct; tapping

the pipes answered best, of course. Every side branch decreased the efficiency. Communication was fairly good, for instance, with a pipe 160 feet long, divided into two side branches, the main pipe being farther continued through a connection containing a valve to two other side branches, each of the four branches having a length of 700 feet.

IN the laboratory of the Mountain Copper Co. at Keswick, Cal., the following method is in use for the wet assaying of chalcocopyrite: Dissolve 1 A. T. of the ore in 6-inch casserole with nitric acid, diluted, so that the action will not be too vigorous, and using as little excess as possible. When solution is accomplished add 100 c. c. concentrated H_2SO_4 , and heat until the fumes of sulphuric acid come off freely; cool, dilute to about 800 c. c., heat to boiling until basic salts are dissolved, add a sufficient quantity of a concentrated solution of sodium thiosulphate to reduce ferric salts and a few c. c., excess to precipitate a small amount of copper; boil a few minutes to collect the cuprous sulphide and allow to settle. When the supernatant solution is clear decant through a filter, wash the precipitate on the filter dry and scorify. Care should be taken not to precipitate much copper.

RICH, high-grade ores take care of themselves, and a good market is afforded by the great smelting plants. Greater general interest lies in low-grade ores that occur in large bodies. Two, three or four dollar ores would be valueless in a small vein, but when it occurs in a deposit more than 400 feet wide one can build upon it for years. The Homestake mine upon ore averaging less than \$4 has not missed a monthly dividend in twenty-four years. It is a mistake to suppose that low-grade ore is only valuable when free milling; the lowest grade ore worked at a profit in the United States is not free milling at all, but produces an ore that must be stamped, concentrated and then smelted. Ore from the Atlantic copper mine has always yielded a value of less than \$2 per ton, yet it is mined, transported a distance, stamped, concentrated and smelted for about \$1.10 per ton, and has been worked at a profit, even when copper was lowest in price.

THE oldest and simplest form of electrical transmission is where a direct current dynamo supplies current to a line of wire from which it is taken without change of any kind for light or power. For illuminating limited areas or for furnishing power to motors through short distances from the dynamo such simple system is often the best. But it has limitations and does not admit of service beyond narrow bounds. Transmission of electric current over considerable distance without loss of power by direct current method necessitates the use of a current of very high electro-motive force, or the use of a transmitting wire of very large cross-section. In the two are developed structural difficulties and in the other arises the prohibitive cost of large copper conductors. The only alternative to those difficulties, ordinarily, is to generate a current of moderate electro-motive force, then to transform it by cheap but efficient apparatus to a high voltage current, then to transmit this current over a line which by reason of the increased electro-motive force and the correspondingly diminished quantity of current transmitted, may be of very small sectional area, then to reduce the electro-motive force at the receiving end by means of transformers to low voltages safe for application to electric motor windings, and finally, to use this twice converted current in motors of a design adapted to the special needs of the work to be done. In ordinary practice the alternating current is, alone, adapted to this method of operating.

IN the Dorcas pneumatic cyanide mill at Florence, Colo., capacity 120 tons per day, the ore averaging \$20 in value, passes through crushers and coarse rolls to the sampling room, thence through a revolving dryer and through two sets of finishing rolls, which crushes it to 24-mesh size. The finely crushed ore is then roasted in a Holthoff-Wetley furnace, the roasted product passing to the leaching tank. There are six of these tanks, 30 feet in diameter, 4.5 feet deep and fitted with air pipes in the bottom for the introduction of air during the leaching. The air is supplied at a pressure not exceeding five pounds, about 1 cubic foot of air per minute to each ton of ore being sufficient for agitation and oxygenation. The treatment generally lasts five days, and leaves a value of about \$1 per ton in the ore. The residue is then sluiced out and concentrated on Wilfley tables. The tailings after this treatment average about 40 cents per ton. The tanks are filled by a conveyor, and as soon as the bottom of the tank is covered with pulp a solution containing ten pounds KCN per ton is run in gradually, the pulp at the same time continuing to flow until the tank is full. The air is then turned on gradually, and is kept on until the pulp shows an extraction of at least 90%. Whenever the air comes up unevenly through the charge the ore has to be stirred by men with iron rods. This generally requires about thirty hours. The air is then shut off and the pulp allowed to settle for one hour. Percolation is then begun, and the strong solution run off as rapidly as possible, followed by a weaker one of five pounds KCN per ton. This operation is continued until the tests of the solution show only traces of gold. Water is then added to displace the KCN solution. The loss in cyanide is stated to be less than one pound per ton. The dust resulting from the dry crushing is collected and treated with cyanide, without previous roasting. From dust assaying \$51.20 per ton the tailings only contained 80 cents per ton. It is added to the roasted ore in the leaching tanks, three tons to each tank, spread evenly on top of the charge.

The Treadwell Mine, Alaska.

[SPECIAL CORRESPONDENCE]

I read in the MINING AND SCIENTIFIC PRESS, Aug. 9, your remarks in answer to a subscriber in Colorado on the cost per ton of ore in the Treadwell mine, in which you state that the monthly returns of cost per ton were about the same, but that the tonnage milled showed a great increase under the new management. I herewith present to your readers two tables hearing on the consumption of dynamite for the month of June, 1900, under the old management, and the month of June, 1902, to which you refer in your columns, under the new management. In 1898 I asked the late Robert Duncan, who was first foreman and then superintendent of the Treadwell mine for a period of about seven years altogether, how much powder he calculated per ton of ore, including development work; he replied, one pound to the ton.

On this estimate I base my remarks on the following tables and have tabulated them very fully, as I think their study will well repay mine owners, managers and superintendents, as they illustrate two ways of obtaining the great object aimed at by all mine managers, viz.: a minimum of cost. The one table shows that the minimum of cost was obtained by keeping that end solely in view, and with no thought of a reserve for the to-morrow, while with the other, which strived for a maximum of production and a minimum of cost, a result was secured that seems impossible at first glance. And even if the following tables show nothing else, they must convince mine owners and mine managers that aggregation is the keynote to the obtaining of the minimum of cost, as in the one table we have a consumption of twenty-two tons, in the other sixty-six tons of dynamite, a difference of 200%, while the difference in cost per ton milled is less than 9%. The difference in milling plant was 240 stamps, or 80%.

In the following tables the term pits applies to the quarry portion of the mine. All the ore broken in the pits is hoisted from the 110 and 220-foot levels. Of the blasts recorded in the pits only 8% are holes; the other blasts are called bulldozing. The powder is placed on the debris from the blasting of the holes and broken fine enough to handle in the cars, and the mills can crush more ore per stamp that is broken up this way than if broken by drilling and blasting again, or by hand hammers, though heavy machine drills are used in the stopes to drill the larger lumps of ore broken by the heavier drills. The fuse is in two lengths, 5 and 7 feet. Twenty per cent of the primers used in the mine are 7 feet, in the pits 8% are 7 feet, the shaft primers are 10 feet. It takes about a case of fuse, 6600 feet, to a thousand primers.

I have prepared the two following tables very fully, as they will well repay a close study, as one of them, I believe, records in detail the largest amount of explosive supplies ever used in a mine in one month:

EXPLOSIVE ACCOUNT TREADWELL MINE, JUNE, 1900.				
Where Used.	Pounds Powder.	Per cent of Powder Used on Different Levels.	Number of Blasts.	Pounds Powder to Blast.
Pits.....	30,950	69.239	11,626	2.66
110 level.....	250	.559	110	2.02
220 level.....	7,600	17.002	2,235	3.44
330 level.....	2,900	6.487	825	3.51
440 level.....	250	.559	90	2.07
Contractors..	2,750	6.152	780	3.52
	44,700		15,665	

15,665 blasts to 44,700 pounds powder, an average of 2.84 pounds to the blast; 86.79% of powder used above the 330 level. As 41,904 tons were milled this month we have an excess of powder to tons of ore milled 2796 pounds. The monthly report for this month shows a cost of 67½ cents per ton of ore milled.

In June, 1900, the 240-stamp mill was being dismantled and rebuilt, and consequently only 300 of the 540 stamps were running, and the table above shows where each management used his powder, and below will be seen the difference of per cent in explosives used, weight of battery, tons milled, cost and presumed reserves created. The 300-stamp mill crushed during June, 1902, 52,654 tons against June, 1900. The difference in cost of labor in mill hauling and rock crushing was \$30.20.

JUNE, 1900.				
Explosives used, 22 tons.....	66 tons.....	200		
Number of stamps, 300.....	540 stamps.....	80		
Weight of battery, 315,000 lbs.....	519,000 lbs.....	65		
Tons milled, 41,904.....	89,654 tons.....	113		
Cost per ton, 67.49 cents.....	72.89 cents.....	less than 9		
Reserves created, 1 lb 1 ton theory, 2796 tons.....	42,746 tons.....	1528		
EXPLOSIVE ACCOUNT TREADWELL MINE, JUNE, 1902.				
Where Used.	Pounds Powder.	Per Cent.	Number of Blasts.	Pounds Powder to Blast.
Pits.....	65,700	49.622	31,975	2.05
110 level.....	400	.302	195	2.05
220 level.....	10,300	7.770	3,770	2.67
330 level.....	11,300	8.610	4,325	2.61
440 level.....	36,400	27.492	10,795	3.37
600 level.....	3,600	2.711	915	3.93
Shaft.....	1,650	1.103	513	3.20
Contractors..	3,050	2.813	815	3.74
	132,400		53,303	

53,303 blasts to 132,400 pounds powder, averaging 2.48

pounds to the blast; 57.69% of powder used above the 330 level. As 89,654 tons were crushed this month we have an excess of powder to tons crushed of 42,746 pounds.* The monthly report for this month shows a cost of 73 cents per ton milled.

It is the intention of Joseph MacDonald, the general superintendent of the Treadwell group of mines, to create a reserve of 1,000,000 tons of ore, and the reason I have been so particular to call the reader's attention to the percentage extracted from the pits and upper levels is the fact that all the machines in the pits are set on the tripod, and the holes are 11 feet and sometimes 16 feet deep, and half of the machines on the 110-foot and 220-foot levels are also on the tripod. No machine below the 220 level is on a tripod, and the efficiency of the machine on the first is as 60 to 40. The holes in the stopes of the levels average by the tripod 9 and bar 7 feet. Another reason, the tripod is always set on solid rock, so that necessarily there need be no reserves; but the har machine in the stopes is set up on broken rock, so that when you start a stope below the 220 level you only draw a third of the ore broken until your stope is carried to the level above. So that the new management is only accepting the inevitable in straining every nerve to create a large reserve, and if the late Mr. Duncan's estimate holds good with the har drill as with the tripod, the new management is to be congratulated on its success by creating in one month over 40,000 tons of a reserve; if no reserve is formed in June, it is a bad omen for the rest of the year, as this month is usually one of the best for procuring plenty of power from melting snow, even if the rainfall is light.

A new 20-drill air compressor is to be installed, so as to keep the air pressure at eighty-five pounds. The medium-sized drill has been gradually replaced by one of the newest and heaviest type.

Since January, 1901, the new shaft has been sunk 335 feet and is now in 844 feet and still sinking.

The tramping of the 2915 tons hoisted daily is done by horse power on the three upper levels, a horse pulling a train of six cars; on the 440 level an endless wire rope system, operated by steam, hauls a train of twenty-two-ton cars; formerly all the tramping was done by car men.

The reason the milling tonnage was so low for June, 1900, is that the 240-stamp mill was being torn down and rebuilt.

The London Financial News of March 13, 1902, states that the Treadwell Co. spent \$500,000 on the building of the 300-stamp mill, the rebuilding of the 240-stamp mill and the erection and equipment of the new hoist—all out of the profits of the mine, besides paying its annual dividend of 6% on its \$5,000,000 capital, and 7½% of its capital has been paid in dividends to its stockholders.

The same authority gives the cost in 1891—the year after the present company was formed—at \$1.68 per ton, and in a local paper, of date 6th inst., a noted mining expert from Rossland, B. C., who had just been on a visit to Douglas Island, gives the cost at the Treadwell for the last year ending May 15 at \$1.28 per ton.

Douglas Island, Sept. 10, 1902.

The detail and analysis of our correspondent's statements are of manifest interest. Any such reliable data concerning that property is always sought by mining men. In this regard it is deemed of added interest for purposes of extended comparison to append the last report to hand, which is the eleventh annual statement of the company for the year ending May 15, 1901, showing the following exploration and development work completed during the year:

No. of Level.	Drives. Feet.	Crosscuts. Feet.	Raises. Feet.	Total. Feet.
220	463	10	406	879
330	1,247	212	482	1,951
440	1,395	52	501	1,948
Totals...	3,105	274	1,389	4,778

No shaft sinking was done during the year. No. 2 shaft will be sunk to the next level during this year.

Exclusive of pits, the total development of the mine to date has been as follows: Drives, 10,907 feet; crosscuts, 3534 feet; raises, 4017½ feet; shafts, 778 feet; total, 19,236½ feet.

The amount of ore mined and sent to the mill from the several levels during that year was as follows: Adit and 110-foot levels, 218,490 tons; 220-foot level, 176,902 tons; 330-foot level, 44,059 tons; 440 foot level, 18,351 tons; total, 457,802 tons. The ore was mined and placed in the mill bins at a total cost of \$321,996. At the date of previous report (May 15, 1900), there were estimated to be 125,000 tons of broken ore in the mine. The succeeding year the amount of ore in the mine was 339,290 tons, an addition of 214,290 tons. The cost of tramping, hoisting and hauling to mill was about 20 cents per ton, which on 457,802 tons amounts to \$91,560. Deducting this from the total cost leaves \$230,435 as the cost of breaking 672,092 tons of ore, or 34.29 cents per ton. Adding the 20 cents cost for delivery to mill, the total cost per ton, including development, has been 54.29 cents. The es-

*It will be observed that the average charge to the blast in the pits is 2.66 and 2.05 pounds respectively. This gain of over six-tenths of a pound is effected by using a primer ¾x4 inches and 1¼x4 inches instead of one 1¼x8 inches.

timated amount of ore in sight and available for the mill on May 15, 1901, was 3,917,589 short tons.

The hullion recovery for the year was as follows, the averages being calculated on the total tonnage passed through the mill:

	Total.	Per Ton.
Tons crushed.....	457,802
Tons sulphurets saved.....	8,143
Tons sulphurets treated at Tacoma smelter.....	7,195
Free gold from mill.....	\$559,126	\$1 22
Gold from sulphurets.....	301.611	66
Total.....	\$860,737	\$1 88

The value per ton of sulphurets was \$41.02. At the close of the year there were 845 tons of sulphurets on hand, saved during the year, valued at \$35,422, which would bring the total yield up to \$896,159, or \$1.96 per ton.

The statement of earnings and expenses for the year is as follows:

	Total.	Per Ton.
Bullion sold, as above.....	\$860,737	\$1 8801
Merchandise account.....	32,325	0706
Iron and foundry profits.....	5,465	0120
Total profits.....	\$898,527	\$1 9627
Mining.....	\$321,995	\$0 7034
Milling and concentrating.....	85,101	1 0859
Sulphuret treatment (\$7.79 per ton).....	56,036	1224
General expenses, Douglas Island.....	4,610	0101
San Francisco office.....	6,173	0135
London office.....	1,326	0029
Paris office.....	224	0005
Consulting engineer.....	1,057	0023
Legal expense, San Francisco.....	812	0017
Bullion charges.....	5,985	0140
Total working expenses.....	\$483,319
Construction.....	62,649
Total expenses.....	\$545,968
Net profit for the year.....	\$352,559	\$0 7701

The total ore taken from the mine and treated from its first working up to the close of the last fiscal year was reported 3,082,133 tons. The total yield was \$7,479,272 in free gold from plates and \$3,101,355 from sulphurets saved—an aggregate of \$10,580,627, or \$2.78 per ton; the total expenses were \$4,979,961, or \$1.31 per ton, showing total net profits of \$5,600,666, or \$1.47 per ton.

The Mt. Morgan Mine.*

Marvelous tales are told of the Mt. Morgan mine, Queensland, Australia, it being described as the "greatest gold mine in the world;" "a geological puzzle;" "the despair of scientists," etc. There is nothing very wonderful about it, but it possesses some features that make it of interest, and two photographs have been secured, one of the Mt. Morgan Works, an engraving of which appears on page 171, the other showing the top of the mountain from the west side, and illustrating the system of timbering by square sets, which has been engraved for that page. It also shows in the open the system previously adopted of working the lodes or hunches of ore in the interior of the mountain. As the ore was removed from the floor where the start was made sets of squared hardwood, 1 foot diameter and 6 feet 6 inches in height, were put in, and this was followed to the end of the richer ore. As the miners rose to get the ore above the squared sets were built up, one on the other. From the outside the mountain is being steadily removed by means of open cuts, and in the picture is shown where the workmen have broken into that part where the squared set stopes were. The removal of the hill has also revealed some of the tunnels which were made in exploration work.

The Mt. Morgan ores are such as are found in conjunction with huge pyritic deposits all over the world, and the only thing unusual about them is the quantity of gold they contain. A portion of the high pyrites bodies is in such a state of crystallization that it disintegrates and decomposes with remarkable ease and speed. The mine is merely the result of the climatic conditions prevailing in that Queensland locality, and is simply evidence of the long continuance of similar climatic conditions to those existing at present. These conditions were assisted in their decomposing effects upon the huge pyritic deposit by the fact that at one time the deposit had been intersected by dykes of dolerite, an igneous material which rapidly decomposes under atmospheric influences. Dolerite and pyrites decompose rapidly when separate, but standing side by side they help each other, the acid products of the pyrites acting powerfully upon the basic dolerites.

The deposit filled a crater-like basin originally rising 500 feet above the surrounding tableland. The ore is a brown hematite containing silica, passing gradually into a ferruginous siliceous sinter. Both the ironstone and sinter contain gold finely disseminated through the rock.

Along the junction of the oxidized and sulphide ore the decomposition of the latter can be seen in all stages, passing from a cellular, slightly brown quartz

* See illustrations, page 171.

to hard, pyritous rock quite unaltered. In the intermediate portions the pyrites are seen lying loosely in cavities in the quartz. Of two specimens, taken at a distance of 15 inches apart vertically, one is a cellular lump of quartz and silicified country rock, containing no pyrites, but having the cellular spaces partially filled with a soft, brownish material, which looks like a magnesian mineral. The other is white quartz, speckled with pyrite crystals, many of which are loose. In this lump are portions free from pyrites, which look like an altered feldspathic rock. Both lumps have the smell peculiar to the action of sulphuric acid on clays and feldspars. Within a space of a few square yards a great variety of decomposition products can be seen, and all the openings in ore give evidence of rapid oxidation in the efflorescence of sulphates of lime, magnesia, iron and copper existing everywhere. Veins of satin spar, which have been formed in this way, occur, filling cracks and fissures, and are still forming, and in a few places possess an emerald tint, due to the presence of copper. The irregular association of kaolinic material with siliceous and iron ores, which seemed so extraordinary in the upper levels of the mine, is now easily explained.

The dykes that have intersected the Mt. Morgan lode have penetrated in an erratic manner, and in the lower levels of the mine masses of country rock and ore can be seen entangled in arms of dolerite of all shapes and sizes. In places it is hard to tell at first glance which is ore, dolerite or country rock. No simple fissures took place here, but a tremendous crushing in several directions, forming numerous irregular openings, into which rushed the probably very fluid basic lava, now forming the dykes. The weathering of such a mixed mass would produce the curious blending of the Mt. Morgan gossans and so-called sinters, and lead to local peculiarities of form, in which the fanciful could easily see funnels and basins, bombs and boulders. One of the features of the new Mt. Morgan is a perfect series of mine plans kept plotted up to date, showing the network of dykes which intersect the ore body. These plans will possess, as the mine development progresses, scientific value to the student of ore deposits. The size of the great ore body is well maintained.

Regarding the reported existence of tellurides in the mine, while no large quantities of tellurides have been detected, almost all of the ore will give reactions for tellurium. The appearance of the mine has changed and the metallurgical department shows still greater changes. The method of treatment is still that of chlorination, but, though the same in principle and involving the same chemical reactions, yet the mode of application has so altered as to make the present system almost a new process. By the former system the ore was crushed dry in rolls, calcined in small hand reverberatories at a heat too low to dehydrate the kaolin; then chlorinated in barrels, the gas being generated under slight pressure, the gold chloride leached out by water and the gold precipitated on charcoal. Although the plant was in the aggregate the largest chlorination mill in the world, yet the separate units—furnaces, barrels and filters—were all small, involving an immense amount of labor and supervision, to say nothing of the loss by leakage, waste and imperfect extraction at each of the many parts of the whole. The chlorine is now applied to the roasted ore as a solution in water, the method being similar to ordinary cyanide and hypsulphite lixiviation, in that the solvent flows onto the ore contained in large open vats, and, in filtering through, dissolves out the gold. This improvement renders possible chlorination on a gigantic scale. The economies are in chemicals, cheaper chlorine and less waste of gas in dealing with large charges; in power, the expensive revolving of the barrels is done away with; in skilled supervision, only the same care and attention is required by a very large vat as was required formerly by each separate small vat; in labor, the calcined ore passes direct to the vats, where it remains until it is discharged as tailings.

In the calcining department the improvements have been in the same direction of increased size of plant. For the oxidized ores large revolving calciners, discharging continuously, are now employed, while for the pyritic ore the general manager has invented a roaster. Metallurgists know that in nothing do ores vary more than in their capacity for resisting oxidation. A roaster which suits admirably a certain ore or the requirements of a certain process may be, and often is, very inefficient when applied to other ores and other processes. The Mt. Morgan ore, though carrying on an average only 15% of pyritic minerals, is difficult to roast dead, and, as in other chlorination methods, a very perfect roast is required for good extraction and economy of chlorine. The ore is dry-crushed in ball mills, then roasted in four large shaft furnaces, cooled and passed automatically to the bins. From these it is trucked to the vats, where it is leached. The vats are large, oblong tanks of concrete and cement, 4 feet deep, with a filter bed of sand and gravel at the bottom. The chlorine is generated from manganese dioxide, sulphuric acid and salt, in stills in the ordinary way, then absorbed by water contained in large cement-lined and covered tanks. From these tanks the chlorine water is conveyed in earthenware pipes and applied direct to the calcined ore in the open vats. The gold-bearing solution is then passed

through charcoal filters. Every part is designed for large tonnage. The tailings are removed from the vat by a mechanical shovel.

The percentage of gold extracted is 95% of the assay value. The gold is the purest yet found anywhere, being approached in purity only by that of the Guiseppe mine, Tuolumne county, Cal. It contains 99.7% pure gold, the rest being copper, with traces of iron and silver.

The mine was opened in 1886. In 1897 the yield based upon the ore worked was \$30.29 per ton; the total working expenses were \$12.53 per ton.

Under date of August 6, 1902, a Mt. Morgan letter to this paper says: "The whole mine is supplied at present by water brought by train—200,000 gallons daily, brought up by rack train. It is three years since the Dee river has run. Not a drop of rain fell here during May, June or July."

Notes on Machinery Constituting a Mining Plant.*

The following notes may be found useful to mine investors and engineers in charge of mining properties; and, although written with a particular view to conditions in British Columbia, pertain to mining elsewhere as well:

From the very time that a mineral claim passes out of the prospector's ownership the question "how to work the property at the least expense and with the best results" presents itself to the investor, and that this has been an important as well as a difficult question nobody will doubt when referring to the numerous idle plants of more or less value found in nearly all mining camps. Any mining failures cannot but reflect on mining in general, and should therefore be guarded with all possible care by the professional engineers.

To make a paying investment and a mine out of a prospect without employing other power than hand labor is hardly possible nor excusable nowadays, except perhaps where the formation is unusually soft and the ores of very high grade, or possibly where the property is remote from any convenient point of transportation. In certain sections of the Slocan and Lardeau districts conditions of this nature exist, but, being rather exceptional, do not exactly come in under the class of mines referred to here.

Hand labor should therefore only be employed to prove the property to a reasonable depth, perhaps 100 feet or so, or sufficient to warrant the investment in a medium-sized hoisting plant; but here I have frequently observed that, instead of getting a medium-sized hoist—say a 10x12—that would develop the property for a couple of years, a large plant and sometimes even direct motion hoists with corresponding equipments are put in. Any one who is interested and makes inquiries why a smaller plant would not have answered the purpose receives invariably the same answer, viz., that expectations of having a great mine some day would make it impossible to get along with anything smaller. If the mine turns out to be wonderful, well and good; but the chances for becoming a great mine are nearly always against the prospect. The number of claims recorded every year compared with the number of paying mines shows this only too well. But even supposing that the small hoisting plant within a couple of years should have to be replaced with a larger one, there is hardly a stockholder to be found in any country that would not be pleased to learn that the mine was producing ore so rapidly that the original prospecting plant was now unable to cope with the increased output. The above does not pertain to hoisting plants alone, but to all matters pertaining to mining and milling investments as well, and it is hardly necessary to add that, if this first principle of economy in mining ventures had been followed out more generally during the past history of mining in British Columbia, considerable of the investors' money and disappointment would have been saved.

Hoists.—In regard to hoisting machinery, I find that it is quite common to see ordinary cast-iron gears and pinions used. As a matter of fact, a geared hoist should not be permitted to handle men anywhere without having the most perfect kind of gearing. I would recommend the use of a cast steel gear with well cut teeth running together with a rawhide pinion. I have applied this design successfully even on large double-cylinder hoists, where the hoisting speed at times would exceed 1000 feet per minute, and where a speed of 600 feet per minute with the ordinary cast-iron gears would be considered unsafe and excessive. The rawhide pinion also does away with 50% of the objectionable noise peculiar to geared hoists and reduces friction as well as wear of teeth.

Where two drums have to be used the main shaft should be in one piece and supported by three pillow blocks. One substantial gear with rawhide pinion placed as close to the center journal as possible will be found to give better satisfaction than two smaller gears on either side. Drums should be loose on the shaft and be provided with removable composition metal bushings. Each drum should be operated by an independent friction clutch, keyed to the shaft

close to the main gear, so that the drums can be run in balance or independent of each other as required. The engine should be fitted with reversible link motions of forged steel.

For a brake device I prefer the post brake, to which a very neat safety contrivance for overspeed can be attached. It consists of a small speed governor geared from the main shaft. Whenever the speed exceeds a safety limit of say 1000 feet per minute the automatic governor will cause a throttle valve to open, thus permitting steam, or, preferably, compressed air, into two small air cylinders, having their piston rods directly connected with the post brakes in such a manner that the compressed air forces the piston down, setting the brakes at the same time. One mutual governor will do for both sides, but each post brake must have its own independent air cylinder.

To take care of the surplus hoisting rope, and to save the dead coils from being worn by that portion of the rope which is in constant use, a false reel can be placed inside of each drum and so arranged that the extra rope can be conveniently let out through a slotted hole in the rim of the drums whenever required. This avoids rope slicing. Unless the mine is producing 500 tons per twenty-four hours from a depth of 1500 feet or more, I prefer a self-contained double cylinder 14x18 geared hoist of the above description even to a first-motion hoist. The amount of material that a hoist of this character is able to handle is quite astonishing, especially where two skips, each of two tons capacity, are used.

SKIPS VERSUS CAGES.—For vertical shafts where the vein is perpendicular, or nearly so, it is only fair to admit that the well-known mining cage has done good work; but wherever it is possible to use a skip or skip car I always prefer it to the cage. Within the last few years the skip system has gained much favor and has been introduced pretty well throughout all the large mines in Butte, Mont., as well as South Africa, both for vertical and incline shafts. It stands to reason that where a large amount of material has to be handled from several levels and from a considerable depth, a single-deck cage with room for one one-ton car only is quite insufficient, and two, three or even four deck cages will have to be employed to do the work. In such cases the combined dead weight of cages and cars becomes both enormous and impracticable. I remember two well-known mines in Butte where four-deck cages were used until a five-ton vertical skip was introduced. Each deck was carrying a one-ton ore car, and the combined weight of four cages and four empty ore cars aggregated 9600 pounds, or 2400 pounds of steel per ton of material hoisted, while a five-ton vertical skip that was put in later on only weighed 5000 pounds, being equal to 1000 pounds of steel to one ton of material hoisted. Where good fuel is expensive and several thousand tons of material are hoisted every day, as in the above case, the amount saved in coal represents a very handsome yearly dividend. The same rule also applies to a smaller hoisting plant. The average weight of a standard mining cage is about 1200 pounds and a 16 cubic foot standard ore car weighs about 800 pounds, making a total of 2000 pounds, while a one-ton skip or a skip car with safety clutches will not exceed 1500 pounds. If 200 trips are made during the twenty-four hours, the extra dead weight would amount to fifty tons, or 25% of the hoisting capacity.

To make the skip system a success it is necessary to have bins or ore pockets cut out at each station in the mine so as to receive the ore or waste made during one shift. When the car man has emptied his car into the ore pocket he returns to the chute to refill it. Any time during the shifts the pockets are emptied, and it will then require a man at the bin gate to fill the skip and prevent spilling of material down into the shaft. This last feature was solved in vertical shaft propositions when the pneumatic ore bin gate was introduced in Butte, as it enables the operator to shut off the ore stream within a second, or, in other words, when the skip is loaded. In addition to the pockets at each level, a storage bin will be required at the top landing. Depending upon the arrangement, several combinations for handling both ore and waste on top can be made, depending upon the ingenuity of the engineer in charge.

It will readily be seen from the above that, by the skip system, economy in labor is possible and the proverbial "waiting for the cage" is done away with. The skip is equally as convenient for handling men and material down to the mine and is safer than a cage.

It is generally advisable to have a large bin capacity on top, as it is often necessary to store different classes of ore. Ideal conditions are those where the ore can be loaded directly into railway cars. A crusher and screen placed above the bin will always be found convenient for breaking and sizing the ores. Ore bins and gallow-frames can usually be built together, and I think that in British Columbia wooden gallow-frames are preferable to expensive steel ones. The danger from fire is equal in both cases, as wood cannot be avoided for the construction of floors and the cost is at least twice as much again as the best wooden frame.

Head sheaves should always be large and lined with rubber or hemp to save the hoisting rope. Wrought-iron spokes cast in with the hub and rim should be

*Read before the Canadian Mining Institute meeting in Nelson, B. C., Sept. 12, 1902, by Alfred C. Garde, M. E., General Manager Payne Mines, Sandon, B. C.

avoided, as the spokes soon will get loose and commence rattling. Substantial shafts made of hammered steel and self-oiling journals are recommended.

For hoisting rope a flexible plow steel, six strands, 19 wire rope is the best. For a skip of one ton capacity a $\frac{3}{4}$ -inch rope is sufficient and for a two-ton skip $\frac{1}{2}$ -inch. It is very common to find too heavy rope used, which, unless the sheaves are proportionally large, will ruin the rope within a short time. The most convenient incline in a shaft using skips is 70°. Rollers should be provided at intervals in the shaftway, thus preventing the rope from dragging on the foot wall.

For inside work over winzes and for sinking purposes I like the friction hoist. It is not exactly the type of hoist that should be placed over an important outside working shaft, but will be found extremely convenient for prospecting with a bucket or small skip. Care should be taken that the hoist is not overloaded, in which case the friction might slip.

Where compressed air is used for hoisting purposes it will nearly always pay to reheat the air just before entering the cylinders. The reheater should be placed as close to the hoist or air drills as possible and all pipes wrapped with waterproof asbestos covering. It is not always convenient to use coal underground. In some cases coke, if not too expensive, might be used.

British Columbia is extremely fortunate in possessing large areas of desirable steaming coal—an advantage which is only surpassed by the abundant water power distributed over the greater portion of the province. No other section in North America can probably equal it in that respect.

Where coal is used for generating purposes I find that eighty or ninety pounds steam pressure is frequently the limit. I should, however, advise having the boilers built to carry 125 or even 150 pounds pressure, as it will be found a saving of fuel to do so.

(To BE CONTINUED.)

Of Historic Interest.

In the issue of the 9th ult. appeared an article on the evolution of the California stamp mill, written by M. P. Boss, in which reference was made to Irving M. Scott of San Francisco and his prominent part in producing the tappet, gih and cam, substantially as they exist to-day. In the course of the article, which is of interest to miners everywhere, Mr. Boss said:

"The high box mortar is thought by some to be due to Zenas Wheeler; but positive information on this point is unattainable. Nor is it to be ascertained to whom is due the introduction of the long battery foundation blocks, set on end."

These matters are of historic interest, and to secure authentic data the MINING AND SCIENTIFIC PRESS wrote to Irving M. Scott, then vice-president and general manager of the Union Iron Works, suggesting that some data on the subject would be of interest and value.

Under date of Sept. 6th, Mr. Scott kindly furnishes the following:

"Your favor of Aug. 8th duly received, and I delayed answering it until I had time to give you the information desired.

"The high mortar now in use is the result of a careful collection of the facts pertaining to gold crushing on the great mother lode. The writer visited all points of interest and carefully examined, measured and sketched the various mortars in use, and the kind of ore and gold mined. The mortars were simply low iron troughs, from 5 inches to 7 inches deep, in which dies were set. The balance of the mortar was made by the millwright at the mill, and consisted of wood lined with sheet iron, of such height as suited the ore worked.

"In some cases the writer found that the discharge of these mortars was very low. Upon inquiry he was told by the millmen that they crushed more rock and saved more gold out of the ore worked by having the discharge that height than by any other that they had tried. The parties in control did not attempt to give the reasons, but simply stated the fact. Again I found the discharge of the mortar very high, and the reason given was that they got more gold out of the ore, though they did not crush quite so much rock. Other mortars would have their discharge at various heights between coarse and fine gold, in which case they claimed that they crushed more rock and obtained more gold than at any other position.

"By carefully measuring these details of mortars and the kind of ore worked, and laying them down on the drawing board in the office of the Union Iron Works, and comparing the different methods, it was found that the low discharge was always used for coarse gold, the high discharge where they had extremely fine gold, and the medium discharge where the gold varied—some flakes and some grains. Therefore, it became apparent to the writer that the law which governed the kind of mortar to be used was regulated by the ore worked, and the millwright had discovered the true height and shape by experimenting, without knowing the real reason.

"About this time Almarin B. Paul introduced what was known as his rotary battery. The nature of the mechanical construction of this battery made a high mortar necessary. From the data obtained

by these very complete and exhaustive tests the writer designed mortars for gold working, for wet crushing and also for amalgamating in the mortar. It was found that the mortar in which you amalgamated had to be wider than where you simply crushed, or else the dropping of the stamp would cut the amalgam off of the copper plates on the lip and in the back of the mortars, and owing to this width not quite so many tons could be crushed in a given time, as in simply wet crushing the mortar is made as narrow at the base as the feeding of the ore will permit.

"In the meantime the Gould & Curry mine had crushed some of its silver ore dry, using the low mortar and building up with the wood and sheet iron. They developed in silver crushing the same condition governing the kind of mortar as in gold crushing, except there was no need in the wet method of very high discharge. Gould & Curry tried to crush through grates in the bottom of the mortar for dry crushing. This led to a series of experiments as to the size of the dry crushing silver mortar, wet crushing, etc., and a mortar to amalgamate when gold was carried in the silver. This, I believe, is the correct account of the evolution of the high mortar as now used in California. It may have been used elsewhere before this time, but I do not know of a single case where the present standard mortar was used in California prior to that time. All the mortars were the outgrowth of the experience of millmen, millwrights and mechanics working at the mill, and, like all valuable inventions, each point was slowly worked out to demonstrate its value.

"Referring to the double-arm cam with a hub on one side, Dr. Southgate, was the inventor of the single-arm cam with a hub on one side, and he claimed that he could get more drops per minute with a stamp, with less jar or blow, by the single-arm cam, hub on one side and stem close to the shaft, than by any other device. In making Dr. Southgate's cam and running it twice the speed of the double-arm cam, a serious wear upon the cam surface and tappet was developed, and the difficulty of keeping this shaped cam tight on the shaft, for in those days the workmanship was not of the best, led the writer to study the question carefully, and when Mr. Smith of Washoe, the owner of the Smith process for amalgamating, was having a mill built for Mr. Fogus, he used the cam of Dr. Southgate and developed the same difficulties. It then occurred to the writer that there was no reason why the cam should not be built with double arms and the hub placed on one side, getting the stem just as close to the side as possible, and giving a blow very much less on the tappet. This idea was carefully worked out and the cam put in the Rappahoe mine, and from that time on all cams were made of that type.

"The first attempt to remedy the surface wear of tappet and cam was to chill the surface of the cam and chill the faces of the tappet. As neither could be satisfactorily adjusted after they were chilled, and as the grinding of them changed their angles somewhat, this method was finally superseded by steel faces and rings put on to the tappet, and a steel covering over the edge of the cam where lifting was done. Advocates of the steel face on the tappet claimed that then the tappet would never wear out, but only the face; eventually, however, both of these methods were discarded in favor of the double-arm cam with a hub on one side, which seemed to overcome all the difficulties, and if made of proper iron lasts a sufficient time for all practical purposes.

"One of the most interesting items in regard to machinery for metallurgical purposes is the evolution of the amalgamating pan. Thomas Varney developed a plan much after the shape of a pair of millstones, and operated on the same principle, having removable shoes on the bottom of the runner and dies on the bottom of the pan, but no provision being made for directing the pulp to the center, to be again thrown out by the centrifugal force in the passage, being ground between the upper and lower shoe. Zenas Wheeler got up a plan very similar, with the exception that he put wings or guide boards on the side of the pan, compelling the pulp to flow in at the center and discharge at the periphery. Neither Mr. Wheeler nor Mr. Varney patented this wing, and in the famous lawsuit between them it was demonstrated that it was the most valuable part of their devices and had not been patented, as Mr. Varney ridiculed the idea of patenting anything to make the pulp flow to the center, as he said that was where it would go naturally, and Mr. Wheeler, while differing from him, did not attempt to patent his wing or guide boards, considering other devices of more value. The result was that the best parts of these pans were taken, the wings or guide boards making a dominant feature, and the combination pan was the outcome of the lawsuit, which pan maintained itself in the market during the entire silver excitement, and is practically the pan now being built to-day. The inverted cone pan of Messrs. Hepburn & Peterson, and the tractory curve pan of Messrs. Wheeler & Randall, as well as a great many variations of pans, did not affect the classification. The man who did the most for the settler was Zenas Wheeler. He made several devices and continued to experiment, and his work finally resulted in the settler as it is at the present time, with a slightly conical bottom,

plenty of water and slow motion wooden shoes. These seemed to be the prominent points in metallurgical machinery at that time.

"Hoping this information may be of service to you, I remain, respectfully yours, IRVING M. SCOTT."

Present Cyanide Practice.

Robert O'Brien, foreman Day Dawn P. C. Co., Charters Towers, Australia, says: "The solutions I have used have been strong, from 0.35 to 0.45; weak, from 0.14 to 0.18. The lime I used was generally mixed with the tailings before dumping; sometimes it was mixed while the stuff was being screened. The quantity used varied from two to forty pounds a ton. The method is this: The tailings are brought to the works, mixed generally with lime, and allowed to stand a week or so. Then they are trucked and run to the brace and hauled up by steam power and put in a pulverizer, which mixes the lime; then they go into the hopper, and from there are put into trucks and run to the vats. These are 20 feet by 7 feet, with 18 inches false bottom, made of stone, fine and coarse, and gravel. The coarse is on bottom, fine on top, and gravel on this. Over this is batten work filled up with coarse gravel so as to make a level surface. The sand is dumped on the top of this. There are ten sand vats of sixty tons each, two are filled every day. When the material is in the vats a strong solution is run on. The solution varies from 0.35 to 0.5 (sometimes as high as 0.68). (If fresh ore is used we assay it to find out quantity of gold in it, and test with two solutions of different strengths, and subject it to two days treatment. Whichever solution extracts most gold, that we use). The strong solution remains in contact for twenty-four hours. Then it is tapped off into a sump. It is allowed to disappear from the surface. Then we run on a weak solution, which generally runs for three days, the tap remaining open. From the sump the solution is pumped up into the receiver, and then falls by gravitation into three extractor boxes which contain filiform zinc.

"Before the solution is run into the extractor box, test is made to find if solution is strong enough to precipitate gold. We assay every vat before and after treatment. After the weak solution a water wash is put in to wash out the cyanide. When the solution is being put through the boxes the zinc is taken out and placed on a sieve and washed with the hands to get off the gold pulp, and the zinc is put back in boxes and used again. The gold slime is placed in a filter with stone and sand, and what remains on top is put into a furnace and roasted. It is mixed with sand and horax and smelted in a plumbago crucible, and then poured into an iron mold. It is roasted to get oxide of zinc out of it. After moulding it is melted and run into a bar. Then it is assayed and sent to the bank. I use the lime always, to save cyanide. I treat concentrates apart from tailings."

W. A. Dixon says: "I naturally use a weak solution. If a strong solution he used, a large quantity of base metals would be dissolved at the same time as the gold, and therefore the ratio of base metal to gold in the solution would be greater than if in a weak solution. The base metals are in a much coarser state than the gold. The selective action, if any, really depends on the amount of surface metal exposed. If the copper were as finely divided as the gold, the cyanide would probably prefer copper. The chemical action with the base metal compounds does not require oxygen, as is required with the gold. Bisulphide of iron, arsenical pyrites, sulphide of zinc and galena are not acted on by cyanide of potassium. But the cyanide attacks various compounds of copper and zinc sulphides, oxides and carbonates of copper. The process is inapplicable to certain ores which contain quartz, earthy matter and little pyrites. With copper ores the cyanide dissolves so much copper as to make the process useless. The effect of acid on the KCN is that it sets free hydrocyanic acid and forms a sulphate of potassium. Lime must be used to prevent this acid action. The hydrocyanic acid will not practically dissolve gold. Mineral acids tend to preserve the solution of cyanogen gas. The pressure indicated by the specification of a closed vessel is to me ambiguous. The free oxygen would be present in water sufficient to take three ounces of gold in one-half ton of water, but not to take out say twenty ounces. Many cyanogen yielding substances will not transfer their cyanogen to the gold. Mercuric cyanide will not act as a solvent. I do not know of any substance which in solution in water will set free cyanogen gas as a gas in water. I have not found by experiment that cyanogen gas itself will dissolve gold. I took some dry mercuric cyanide, using a quantity which would yield cyanogen gas to saturate a liter of water. I washed the gas by passing through wash bottle containing distilled water, and then passed into distilled water contained in a blue bottle—the light tending to decompose cyanogen—and later tried effect of solution on gold. I have made experiments with cyanogen gas on Mt. Morgan ores, on Mundic ores, and on oxide ores—ground samples—allowing for a contact of twenty hours with gold leaf, but no gold was dissolved, even with all distilled water."

The Gold Production of North America, Its Geological Derivation and Probable Future.

Reference was editorially made in last week's issue to a paper with the above title, read by W. Lindgren of the U. S. Geological Survey, at the Butte, Mont., meeting of the Mining Congress on the 3rd inst. The matter is deemed of sufficient general interest to be presented in full:

It should first be stated that practically the whole of the gold output is derived from fissure veins or from deposits which possess close relationship to fissure veins. Gold-bearing fissure veins are in most cases accompanied by placers which are only the result of nature's crushing, concentrating and refining; and these placers may be of different ages, according to the date of formation of the vein. For the present purpose the placers will not be considered separately but as belonging to the veins from which they were derived. Fissure veins are formed chiefly by ascending hot waters. From this we conclude that the gold has been brought up from lower levels of the earth's crust.

Fissure veins carrying gold have been formed at various times during the geological history of the continent. The conditions seem most favorable when extensive eruptions of surface lavas and intrusive granites and porphyries have taken place. As a last chapter in the eruptive activity, the hot springs bring up their loads of precious metals and deposit them in the fissures in the earth's crust, which they follow as the easiest paths. The question as to the origin of the gold, or, in other words, from where the waters obtained their charge of precious metals, is a most interesting subject, but one which does not concern us at present.

From the Eastern coast to the Western ocean the mountains of North America contain gold, although the greatest treasures, as is well known, are stored in the great ranges of the Cordilleran region.

From the time of discovery up to 1900 the United States have produced \$2,360,000,000, Mexico at least \$181,000,000, and probably twice as much, and British North America \$142,000,000, making a grand total of \$2,683,000,000. This great product is divided among primary veins of pre-Cambrian, Cretaceous and post-Miocene age. These are the grand divisions, but when it comes to details it will soon be seen that it is a difficult matter to separate the last two groups. In fact, from the beginning of the Trias down to the present times great eruptions have followed each other on the Pacific coast, and each of these was probably accompanied by more or less extensive gold deposition. In the Rocky mountain region the igneous rocks began to break out at the close of the Cretaceous and have continued up to a recent date. On the whole, then, the gold belts of the Pacific slope antedate those of the Rocky mountain region, though in both provinces the mineralization has continued to the late dates. Even at the present time gold veins are known to be forming in certain parts of Montana and Nevada. But far older than these is the first-mentioned pre-Cambrian group of gold veins, and we will begin by consideration of these.

About 100 years ago gold was discovered in the slates of the Appalachian mountain region, in Georgia and in the Carolinas, in Tennessee, Maryland and Virginia—yes, even farther north. These are placers and gold-quartz veins with free gold and auriferous sulphides, and much of the gold can usually be extracted by amalgamation. Poorer deposits of the same kind have been found up to the Canadian line and north of this richer gold veins occur in Quebec, Ontario and Nova Scotia. During the last century this belt produced \$47,000,000 in the United States and \$17,000,000 in Canada, chiefly in Nova Scotia, and during the last ten years the Southern States have pretty regularly yielded \$300,000, and from \$500,000 to \$1,000,000 in Canada. They are not rich, according to our standards for the Cordilleran provinces, but the yield is steady and can be relied upon for many years to come.

Most of these veins were evidently formed before the Cambrian period; they are thus very ancient and existed long before the great forests of the Carboniferous had been transformed into coal beds. We have evidence of this, for the Triassic sandstones of the Atlantic coast contain placer gold; Carboniferous conglomerates in Nova Scotia are likewise said to contain debris of these veins, and in the Black Hills the Cambrian sandstones yield placers of precious metal.

This locality has not been mentioned yet, but it is

the most important of the deposits of the pre-Cambrian age. The old pre-Cambrian schists of the Black Hills in South Dakota contain fissure veins and seam belts of free-milling gold ores at places where erosion has removed the overlying Cambrian sandstones. These deposits are worked on a large scale, though the ores are poor and have yielded since the discovery in 1877 about \$80,000,000, and produce annually from \$3,000,000 to \$4,000,000 from this source. Here again the yield is said to be assured for many years, and this sustains the statements made above about pre-Cambrian deposits.

Altogether, then, the pre-Cambrian deposits have given us since discovery \$144,000,000. One more thing should be said about this class: In most cases extensive erosion has taken place since these veins were formed, and the surface of the land at the time of their formation must in some cases, at least, have been thousands of feet above the level at which they are worked at present. They are the "roots" rather than the outcrops of veins, and this inspires belief in their permanency. For a long time after the pre-Cambrian veins had been formed no further mineralizing action occurred. We do not know of any Silurian, Devonian or Carboniferous gold deposits in North America. But in the Mesozoic age the great eruptions of the Cordilleran region began and the Cretaceous period was especially remarkable for the many mineral deposits formed throughout that region.

(TO BE CONTINUED.)

Strike at the Gambetta, Cal. Mine.

In last week's issue was an account of a recent strike at the Gambetta mine, Madera county, Cal., a region of which little is heard, but yet of some general importance. In Grub gulch, where the Gambetta, the scene of the latest rich strike, is situated, there are two distinct types of veins. There are fissure veins which occur in granite, and also in slate or schistose magnesian rocks, and when in these latter have a strike and dip across the inclosing rocks.

Gambetta Mine, Madera, Cal.

These veins usually have well-defined walls, are narrow, seldom exceeding 24 inches, and frequently carry a high-grade sulphide of iron, sometimes associated with arsenic; sulphides of lead, zinc and copper also occur. Much of the quartz is crystallized, calcite is of frequent occurrence, and not infrequently small greenish scales of a magnesian mineral occur. Among the veins of this type is the Gambetta mentioned in "Mining Summary" on page 166.

Most of the mines of Madera county differ from those just described and form the second type of veins referred to. These occur in fine-grained mica slate; conform nearly with the slates in both strike and dip and are often found associated with granite dikes. The quartz occurs as an infiltration, saturating the slates and sometimes forming solid masses of quartz, but usually the slaty structure of the original rock may be very plainly seen. The shoots occur in a series of lenses, sometimes following one another in a straight line. In this case one wall is often well defined, the fissure evidently being one of displacement as well as of fracture. More commonly, however, the quartz lenses, while following a general trend, lie at an angle, the ends sometimes overlapping. Again, several lenses of varying sizes are found in a zone of several feet wide, and not only the quartz, but the slaty material of the zone are mined and sent to mill. Of this type of mines there are many examples. Among them are the mines of the Savannah group, the Starlight on the same lode, the Fresno Enterprise, and nearly all the mines about Coarse Gold.

LEADVILLE, COLO., probably has more assaying work than any city of its size in the country. There is a great deal of assay work done in Denver, Salt Lake and San Francisco.

Rock Drill as Blacksmith's Hammer.

A correspondent writes the American Machinist as follows: "While visiting the Elkton mine at Cripple Creek, Colo., last summer I was interested in the ingenious way in which a rock drill had been rigged up to take the place of one or two blacksmith helpers in the blacksmith's shop. The drill, minus the tripod, was fastened to a vertical support. An ordinary anvil was fixed in a position under the ram, and the necessary air connections were made with the cylinder. When a blacksmith has some heavy hammering to do he has some one, as usual, to man-

age this contrivance, while the smith takes care to have the blows struck in the proper place, as with a steam hammer, except that the blows are not as heavy, but a sight more numerous for a given space of time. At the time that I saw this improvised steam hammer in operation the blacksmith was working down a piece of steel or wrought iron, about 3 inches wide at its widest part, 1 inch thick at its thickest part, 2½ feet in length, tapering in both width and thickness, and the hammer appeared to be doing excellent service. It appeared to me to be a very simple, effective and quite inexpensive apparatus, especially considering the fact that it, excepting the hammer head, was rigged up from material to be found in any mining outfit, and that it could be very easily resolved into its original parts and their former duties resumed, since neither drill nor anvil suffers any from this somewhat unusual use."

Water Measurement in the Yukon.

In the Yukon an "order-in-council" has been passed defining what is understood by the miners' inch, and providing a method of measurement according to the following table:

Dimensions of Orifice in Inches.		Head in Inches Over Center.	Discharge in Cu. Ft. per Min.	Number of Miners' Inches of 1½ Cu. Ft. per Minute.
Wide.	Deep.			
6	2	6 25	11 99	17 98
12	2	6 25	24 25	36 38
18	2	6 25	36 39	54 59
24	2	6 25	48 70	73 05
4	4	6 25	15 71	23 56
6	4	6 25	23 57	35 35
12	4	6 25	47 30	70 95
18	4	6 25	71 65	107 48
25½	4	6 25	101 58	152 37

Large quantities of water for mining may be measured at any convenient point by discharging over weirs, through orifices. Smaller quantities of water, where delivered from ditches, flumes or canals into small ditches or flumes, shall be measured at the point of diversion of the branch ditch or flume. It shall be taken from the branch ditch, flume or canal through a box or reservoir, arranged at the side, and the water shall have no appreciable velocity of approach. The orifices shall be vertically at right angles to the delivering water way, and the edges and corners shall be square and sharp, and the top, bottom and sides at right angles to the pressure board, and the discharge shall be freely into the air. The distance between the sides and bottom of the orifice shall be at least three times the least dimension of the orifice.

Mining and Metallurgical Patents.

Patents Issued September 16, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MACHINE FOR PERFORATING PIPES.—No. 708,763; E. R. Graham, Bakersfield, Cal.

Combination of rod adapted to extend into casing, mandrel or spreader carried at end of rod, sleeve in which mandrel is slidable, longitudinal slots in sleeve, projections on mandrel extending into slots, head in connection with sleeve, radially operating knives carried by head, mandrel adapted to engage knives to force latter outwardly against casing, means for holding head at any desired point in casing, and collar carried by mandrel adapted to contact with end of sleeve when mandrel engages knives, whereby movement of mandrel through head and sleeve may be limited.

DRILLING MACHINE.—No. 708,995; W. E. Butler, Bedford, Ind.

In drilling machine, combination of suitable frame, reciprocating slide, plurality of drills located above path of slide, plurality of drills located at rear end of traverse of slide, master gear, plurality of shafts perpendicular to master gear, serving to operate first-named drills, shafts having gear connection to periphery of master gear, and shaft parallel to master gear serving to operate last named group of drills, last named shaft having gear connection with lateral peripheral margin of master gear.

HYDROCARBON FEEDER FOR EXPLOSIVE ENGINES.—No. 709,428; F. B. Warring, San Jose, Cal.

Combination with carburetor of engine, casing having separate interior oil supply and vacuum chambers, latter having connection with carburetor, having also end opening, valve stem movable in casing, valve carried by stem and controlling port between

oil supply and vacuum chambers, piston on stem within vacuum chamber, retracting spring connected with stem, guide for opposite end of valve stem.

GENERATOR FOR CHLORINE GAS.—No. 709,004; T. Edwards, Ballarat, Australia.

A generator for chlorine gas, of semi-cylindrical form having flat top, journals near top projecting laterally upon which generator may rock, dome surmounting flat top, gas pipe leading therefrom, covered opening in flat top to one side of dome.

ROCK DRILLING ENGINE.—No. 709,022; J. G. Leyner, Denver, Colo.

In rock drilling engine, combination with cylinder and piston, rear cylinder head, supplementary cylinder head having rearward hub projecting, of ring portion clampably secured to supplementary cylinder head, circumferential groove in inner periphery of ring, water inlet member, arranged on ring to intersect circumferential groove of ring, provided with hose connection at one end, and valve at opposite end adapted to control water inlet and circumferential groove of ring, axial slots in hub of supplementary cylinder heads, intersecting circumferential groove in ring, and axial bore in supplementary cylinder head provided with tapering portion, tapering sleeve adapted to fit taper portion of axial bore of head, extending beyond head's hub end, nut threaded to end of sleeve, adapted to bear against hub's end, axial bore in sleeve, plurality of radial slots in tapering sleeve extending through its shell into its axial bore, water conveying tube fitting loosely in bore of tapering sleeve, adapted to be clamped to sleeve by threaded nut at its end, and hood secured over end of hub of supplementary cylinder head, arranged and adapted to form closed water passage from axial groove in hub to end of water conveying tube.

MATCH SAFE ATTACHMENT FOR MINERS' LAMP HOLDERS.—No. 709,452; J. A. Brown, Pictou, Colo.

Combination with lamp holder of class described, of matchbox pivotally mounted on inner surface of holder provided with hinged lid, wire connected at one extremity with hinge pin of lid, extending outwardly beyond lamp holder on one side, where it is bent and carried in opposite direction suitable distance where it is coiled around pin on holder, finally bent downwardly, carried across matchbox, its free extremity passed through loop or eye formed on lid.

ROCK DRILL.—No. 709,191; R. Avery, Sausalito, Cal.

In a drill, a casing, a drill har of which is guided and slidable within casing, mechanism by which drill har is first retracted and subsequently turned, consisting of pawls and cams by which pawls are caused to grip and retract drill har, shaft upon which cam is carried, spur gear loosely mounted upon shaft having ratchet wheel turnable in unison with it, lever arm fixed upon shaft through which power is transmitted to turn it, spring-pressed pawl, carried by lever and normally out of operative contact with ratchet teeth whereby shaft and cam are moved before pawl engages ratchet, second spur gear engaged by first mounted upon shaft with casing, and bevel gears through which motion is transmitted to turn drill bar when pawl has engaged with ratchet, spring surrounding first-named shaft whereby shaft and parts carried thereby are returned to their normal position after pull upon lever has been released.

ORE LEACHING APPARATUS.—No. 709,135; J. Brown, Tonopah, Nev.

Apparatus for leaching ores comprising tank adapted to contain water or other liquid, conduit connected to and extending upwardly from tank having plurality of chambers, hopper disposed above upper chamber, ball valves for controlling discharge of chambers and hoppers, electro-magnets disposed above valves and adapted when energized to raise same, hoods and deflectors arranged in chambers and hopper above electro-magnets, electro-generator, movable commutator, circuit wires connecting magnets, generator and commutator; being adapted to change circuits and condition of magnets.

PROCESS OF SEPARATING ALUMINA FROM SILICA.—No. 708,561; A. Kayser, Buffalo, N. Y.

Separating alumina from silica, which consists in heating mixture containing alumina, silica, lime and soda in proportion of two molecules of soda to one molecule of alumina, two molecules of lime to one molecule of silica, to cinderling temperature, leaching out aluminate of soda thus formed and recovering alumina from solution.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCHISE COUNTY.

T. H. Collins, secretary Calumet & Arizona Co., says the company expects to start their smelter at Douglas Nov. 1. The smelter will have a capacity of 300 tons daily.

C. A. Heberlein is in charge of the Black Diamond mine, Dragoon range, 20 miles from Bisbee, where thirty-five men are working and developing the property.

The Old Terrible—known as the Golden Rule—is being developed. There are thirty-five men employed there.—The Golden Rule Co. is putting in twenty stamps now and will put in twenty more as soon as the machinery arrives. The Cananea, Yaqui River & Pacific Railroad will run within 2 miles of the property.

At Pearce J. Brockman is manager Commonwealth mine. Eighty stamps are in operation. These stamps crush 230 tons of ore daily. There are 200 men employed on the Commonwealth night and day shift, with three shifts of eight hours on the underworkings. The mine timbers, framed at San Pedro, Cal., shipped to Cochise in carloads, are hauled to Pearce in the same manner as they haul oil—five or six oil wagons in a line, containing each from forty-five to ninety barrels, and then with a team of twenty-six horses the trip of 16 miles is made daily.

GILA COUNTY.

The Old Dominion Copper Co. at Globe shut down on the 11th. Three hundred men are out of employment. The reason is the present low price of copper and the extortionate railroad charges demanded by the Gila Valley, Globe & Northern Railway, with whom the company has been carrying on negotiations for a lower rate for some time.

The Prescott Realty Co. is reported to have just closed a \$500,000 deal with New York people on 400 acres of land adjoining the Old Dominion and United Globe properties.

MARICOPA COUNTY.

The Socorro Gold Co., near Wickenburg, are having ore tests made to determine the kind of plant to install in connection with the new 20-stamp mill.

The Black Rock Co. has men at work on the Powell & Manchus group, northeast of Wickenburg. The mineralized zone is 800 feet in width and several thousand feet long, the richest portion being a body in the center—a pay streak about 4 feet wide, assays on which give \$12 free-milling gold. Following this streak, a shaft has been sunk 200 feet and three drifts, from one of which a crosscut has started. The ore being brought up from the 200-foot level shows the same values as that on the surface.

Near Wickenburg, Superintendent Cree of the Fort Pitt & Arizona M. Co. will develop the property in the Buckhorn basin, 2 miles south from the Keystone.

MOHAVE COUNTY.

Klingman reports the transfer of the Leland Mitchell group of mines was closed by the payment of the full amount—\$500,000. The new company may build a railroad from the Santa Fe near Franconia to the mines, or will prevail on the Santa Fe to build the line. There are 14 miles of the grading complete; all that is necessary is to lay the ties and steel. Mills can be erected on the mesas, where estuary water can be obtained at a depth of 30 feet. The Leland-Mitchell group of mines is near the Boundary Cone, across which the 35th parallel north latitude runs.

The owners of the Planet propose resumption of work Oct. 1, to open the mine to a depth of 1000 feet.

Work on the Catherine mine of the New Comstock group is progressing; ore is being opened up in the drift.

The mines owned by J. McGregor in the Eldorado Canyon country are sold to Eastern men.

YAVAPAI COUNTY.

At Congress, the Congress Gold Co. employs nearly 500 men. The new shaft is down 800 feet.

Near Yarnell the mill on the Model mine is completed. The ore runs \$13 per ton gold. The Planet-Saturn people are reported to be figuring on taking hold of the Yarnell and making a string of mining camps from Fool's Gulch to the top of Yarnell hill. Twenty men are working at Fool's Gulch; W. A. Clark, manager.

A smelter for the Iron King will be erected near Jerome—a 200-ton water-jacket, on the north side of the gulch from which the mine is opened, east of the boarding house, high enough up the

hill to take advantage of a large dump for slag. Thirty men will go to work when Superintendent Giroux returns from Nevada.

At Octave are now employed about 150 men in the mine; men in the mill, store, cyanide and other places in the camp make the total force employed by the company about 200.

The Jerome News has it from a reliable source that W. A. Clark and his associates in the Equator M. & S. Co. will erect a smelter on their property on Equator hill, about 4 miles south of the town of Jerome.

Phoenix reports a disastrous fire at the Planet Saturn mine in Fool's gulch, in which a son of Superintendent W. A. Clark was burned to death.

CALIFORNIA.

HUMBOLDT COUNTY.

The Cordella Heald, a small steamer equipped with a dredger, is in the Klamath river for several weeks, prospecting and preparing for river bed mining. Commencing near the mouth of the river, the men propose to work up the stream, moving slowly or rapidly according to results obtained. The craft is fitted with appliances for warping the board up stream over the riffles. The dredger is an agitator which loosens the mud and gravel.

LASSEN COUNTY.

The Golden Eagle M. & M. Co., Hayden Hill, has sold all its property to the Lassen Mining Co., Sloss Bros., Benjamin, Hunt & Meredith, who have been actively developing it. A 100-ton cyanide plant will be put in. E. H. Benjamin will have charge.

MARIPOSA COUNTY.

Merced G. M. Co. has filed the annual statement of its affairs with the Silver Bow, Mont., county clerk. It shows that the capital stock is \$2,250,000, of which \$1,500,000 is actually paid up. The amount of indebtedness is given as \$61,795.90. The report is signed by A. S. Bigelow, president, and W. J. Ladd, secretary, who, with J. S. Bigelow and F. Klepetko, constitute the board of directors.

NEVADA COUNTY.

At the North Star mines 150 men are at work. Twenty-five stamps are running. The North Star shaft is 2400 feet deep. The central shaft is 1600 feet deep perpendicularly. A new 260 H. P. engine is going in and a triple expansion duplex pump.

At the Empire mine, Grass Valley, the main incline shaft is nearly 2800 feet deep. About 120 men are employed. Sinking the Omaha shaft 300 feet further has begun, superintended by E. Berry. About forty men are employed.

The Union reports the old Nichols mine has resumed operations, J. L. Larimer superintendent. A two-compartment shaft is begun. Oil will be used as fuel.

Preparations are being made to start up the Ironclad again; work was suspended pending the installation of a large pump.

At present there are about 620 men employed in Nevada county mines.

PLUMAS COUNTY.

A \$1200 nugget was recently taken from a piece of mining ground on Jamison creek, in gravel that had been worked over several times.

J. D. Whitney and associates have bought the New York mine, near Greenville, for \$25,000. Improvements will be made and the mine opened up and worked.

SAN BERNARDINO COUNTY.

F. M. Miller, local manager Leland Mitchell M. Co., in charge of surveyors laying out sites for a milling plant on the Colorado river below Needles, will build the Gold Road mills there. The statement is made that the matter of a railroad from a point on the Santa Fe near Franconia to the Leland mines was recently taken up with some of the officials of the road, and that the building of the line is assured. The road will be built as far into the mountains as it is possible to carry on traffic, and then a spur will be extended to the properties near the summit of the range. In this way all the output of the mines can be reached and conveyed by train to the point of reduction. A rate has been made to the Needles for the companies that will be as low as can be obtained to any point in Arizona, and which rate is said to be not over 50 cents a ton. The company make the statement that the reason for the building of the mills in San Bernardino county is the high rate of taxation in Mohave county, Arizona. The Klingman Miner says: "It is also understood that all the plants will follow the example of the Leland and unite on the installation of great power plant at the river, from which point all the machinery at the mines will be driven."

SAN LUIS OBISPO COUNTY.

H. B. Gleason of Los Angeles has men at work, 5 miles from San Luis, on ore showing \$14 per ton.

SANTA BARBARA COUNTY.

After having spent nearly \$50,000, the Craciosa Oil Co. has struck a gusher on the Harris ranch, near Casimira, about 2 miles from the Careaga oil wells. The well is producing at the rate of 250 barrels daily. Several wells are now being sunk. George Crocker and other San Francisco men are the principal stockholders.

SHASTA COUNTY.

F. E. Ware, of the Mount Shasta G. M. Co., says the retimbering of the 350-foot shaft of the Mount Shasta mine on Clear creek has been concluded and extraction of ore from the bottom of the shaft will be resumed. A drift will be run from the 350-foot level and the shaft be continued to 400 feet. At the Summit group of copper mines in the Backbone district, owned by his people, the crew is to be increased.

Frick & Bemis, on Middle Creek, will incorporate and develop the Illinois group. The ledge shows 2½% copper, some gold and specimens of graphite. The tunnel is now in 150 feet.

G. F. Greaves has charge of work on the Summit mine, 7 miles west of Kennet, under bond to the Mount Shasta Mining Corporation.

W. C. Oakes, of Sonora, has the Golden Star quartz mine, east of Downieville, and will sink a shaft on the vein.

At the Papoose mine, Jim Crow canyon, twelve men are now employed. The tunnel is advanced 60 feet. The ditch is being enlarged preparatory to putting in air compressors.

G. A. Von Krusze, owner Sybil mine, French Gulch district, is shipping ore.

SISKIYOU COUNTY.

At the Rusby mine, 15 miles from Yreka, men are putting in a 40 H. P. boiler. New hoisting machinery is to be added and all arrangements made to sink 200 feet.

At the Schroeder mine, Deadwood, twenty-six men are supplying the mill with ore.

Eight men are developing the mine recently bought by G. V. Gray on Cherry creek.

At Rollin, L. D. Ball expects to block out 200,000 tons of ore before next spring, which he estimates will mill \$5 per ton.

In the Evening Star mine J. Daggett has ten men at work.

TRINITY COUNTY.

A six months' bond has been taken by Spokane men on the Enterprise group of quartz claims near Coleridge.

The Cie Fse hydraulic mine has closed down for the season.

The Weaverville Journal says the Enterprise group and 10-stamp mill is bonded for \$50,000 to Hays & Stevens of Spokane. The last mill run of twenty-one tons, made two weeks ago, resulted in 37½ ounces in gold, worth \$17.25 per ounce.

The Buckeye M. Co. is opening a mine on Buckeye creek, 2 miles from Carrville. The Morrison Gulch mine, Coffee creek, will build a new flume.

The Golden Jubilee has closed down temporarily to make repairs and arrange for a new system of work.

The Headlight mine on Coffee creek will start up as soon as water comes. The owners are making additions to the cyanide plant and putting in larger tanks.

TUOLUMNE COUNTY.

(Special Correspondence).—The Bell mine, W. L. Rule superintendent, has a good ore shoot, just opened, and is going to put in a new 5-stamp mill.—The Street mine, R. Kinsman owner, is in good pay ore. There is a 5-stamp mill on the property and Mr. K. expects to add five more.

Tuttlestown, Sept. 24.

The Longfellow Cong. G. M. Co. will start their mill next week.

The Miegban G. M. Co. will work the Mount Jefferson mine. Ten stamps are to be started now and ten more next week.

The main shaft at the Grizzly mine is down over 1000 feet.

There is building a 4300-gallon oil tank for the Clio M. Co. at Jacksonville.

The Black Oak mine has resumed.

The Draper shaft has a depth of 570 feet. The company is just about completing a 5-stamp mill alongside of the former one, which will give a capacity equal to about fifteen stamps.

At the Prudhomme a shaft has been sunk 300 feet. A mill is on the ground. Sulphurets worked realized \$295 per ton.

The Puerto Fino, A. W. White, superintendent, has a shaft down 235 feet. The ore is base; 11% sulphurets give a value of \$390 per ton. They have a two-drill compressor and for fuel use wood.

At the Hazel Dell, near Sonora, Superintendent Colpe will drive a tunnel from the river level to strike the vein at a depth of 900 feet, the tunnel to be 4600 feet long. When finished it will drain the mine and permit working at less expense.

Work is resumed at the Hard Tack.—

At the Lost Fox is a ledge of ore which assays \$4 per ton.—The Chapparel mine, owned and operated by F. Wenzel of Sonora, is showing a body of free milling ore.—A contract has been let to run 500 feet of tunnel on the Mayflower group, on the south fork of the Tuolumne river, near the Buchanan. This mine has a good ledge with a 10-stamp mill on it.—The Georgiana has been bonded by San Francisco men. The property is near the Grizzly and owned by Floyd, Sharwood & McTarnahan. Fifteen men are at work.—E. C. Holmes has a bond on the Great Wonder mine, on the east extension of the Buchanan.

YUBA COUNTY.

The California Debris Commission on the Yuba river improvement will receive proposals until October 16th at noon; if the bids are accepted work can be started about December 1st. Barrier No. 1 is to be constructed at the Harriman farm, near the Parks Bar bridge; in the report of the Commission it is described as a dam with a by-pass.

The following is from the Tidings-Telegraph: "The group of mines in Brown's valley under the management of Julian Sontag, and comprising the Pennsylvania, Dannebrog and Hawkeye, have been sold to E. W. Johnston of Marysville for a San Francisco party, supposed to be T. J. Hibert & Co. The price is said to be \$60,000."

COLORADO.

CHAFFEE COUNTY.

Jones & Denham, owners of the Independence mine at Turret, have sold an interest in that property—approximately 45%—to Salida and Iowa men for \$50,000 cash. Jones & Denham retain control. The mine's output will pay the cost of development and for additional machinery.

The Salida smelter's eighteen ore bins have a capacity of 25,000 tons. It will handle considerable of Leadville's low-grade ore.

CLEAR CREEK COUNTY.

The Georgetown Courier says the Rothschild G. & S. M. Co. is steadily advancing its tunnel in the town of Argentine, 4 miles beyond Argentine pass. The tunnel work is being done by Maxwell & Cleaves as contractors and is in 1300 feet. The company owns about 100 entire and fractional claims. The tunnel has already cut about ten veins.

R. Willis is organizing a new company to operate in the Idaho Springs district. The property is opposite the Lamartine, eight full claims and a tunnel site of 3000 feet to start on a cross vein 8 inches in width in the center of the breast of the tunnel.

Near Silver Plume, B. C. Catren has consolidated the Dunderberg, Brown, Coin, Smuggler, Silver Ore and Terrible mines, about 500 acres of Sberman and Brown mountains. He will operate forty air drills and also erect a mill building for 500 tons daily. Sixty men are employed on the outside at present. The Terrible shaft is down 1400 feet; it will be pumped out, retimbered and sunk to a depth of 2000 feet.

CUSTER COUNTY.

The Maverick mine shaft near Rosita is being sunk. The Custer M. & R. Co. has engaged W. Cochran, formerly with the Bassick mine, to manage the Maverick. Assays show eighty ounces of silver to the ton.

DELTA COUNTY.

A strike is reported in a new district 12 miles from Hotchkiss.

EAGLE COUNTY.

At Red Cliff, in the California mine, Mrs. J. E. Dunne, manager of the mine, has installed machinery worth \$10,000 to assist in the further development of the property.

FREMONT COUNTY.

The U. S. R. & R. Co. is reconstructing the smelter recently bought near Canyon City and will spend \$75,000 in the new work. The present management uses the Bartlett method for smelting lead and zinc. One hundred men are employed. Some of the ore treated will come from Montana, Utah, Arizona and New Mexico. The present monthly payroll of the plant is \$8000.

GILPIN COUNTY.

The Consolidated Investment Co. has been organized in Kansas City to work the Vassar claims and Graham tunnel, in the Vermilion district.

The Running Lode mine, within the city limits of Black Hawk, is owned by the Gower Mines Syndicate, Ltd. The production for the past month was 170 tons concentrating ore, all of which was treated at the Newton mill at Idaho Springs. In addition to this there were produced about eighty tons of smelting ore which were shipped to the Denver smelters. This class of ore gave returns of \$100 per ton. All of this product is

coming from the eighth and ninth levels. Superintendent Nelson of Saratoga will unwater the Iron and Pewabic shafts, Russell district. The Iron shaft is over 600 feet deep; the Pewabic shafts are about 400 feet in depth.

M. D. Draper, superintendent Town Topics G. M. Co., operating the East Notaway group in Russell and Lake districts, is making regular shipments to the stamp mills and sampling works at Black Hawk and to the Golden smelter. Returns on the smelting ores give \$200 per ton, and another lot of ore gave values of \$30 per ton for the tailings. Some free gold is found in the workings.

Near Central City, Superintendent Hoskins is sinking at the Carr mine, on Boh-tail hill. The shaft is down 800 feet and will be continued to 1000 feet. The smelting ore is hauled by wagon to the sampling works; the mill stuff is sent over the aerial tramway; seventy men are at work.

HINSDALE COUNTY.

At Lake City the Dupre Co. is shipping two carloads a week of high-grade gold ore from the Isolde mine.

The Hidden Treasure Co. employs fifty men in its mine and mill.

The Tabasco Co. have their power plant, tramway and mill completed and in running order.

A three-compartment shaft, 4½x15 feet, is being sunk by the Auric Co. to cut both the Ute and Ulay veins.

LAKE COUNTY.

The Leadville News-Dispatch says there is less than 20 feet of water in the El Paso mines, and that will be pumped out the present month. It was thought that the property would not be pumped out before Oct. 10th. Four months ago Superintendent Newell started his first work, and has erected a new plant, unwatered 25 miles of workings, lowering the water 500 feet.

In the property of the Home M. Co. leased to J. Evans he has a body of low-grade chlorides. He is daily hoisting thirty tons; it runs 300 ounces in silver and from 40% to 50% lead.

Superintendent McPhee has opened up a body of iron ore in the Home.

OURAY COUNTY.

A 10-stamp mill will be put in at the Brooklyn mine, near Chattanooga. The low-grade ore is being put on the dump, the high-grade is being shipped to the smelter at Durango; average three cars per week; values from two to three ounces in gold and silver. Last month the smelter returns were \$3500; the cost of mining and treatment \$800.

PITKIN COUNTY.

Aspin mine owners contemplate a reduction in the royalties charged lessees from 30% to 50%. In addition to the reduction in royalties the mine owners project hoisting the waste for the lessees, thinking they have done their part in breaking the rock and conveying it to the cage. A reduction in the blacksmith charges for sharpening drills is also under consideration.

SAN JUAN COUNTY.

Silverton says the concentrating mill, fifteen tons capacity, near Burro bridge, is completed and will operate on Robert Bonner ores.

A strike is reported on the Copper King, Boulder mountain, San Juan district.

SAN MIGUEL COUNTY.

Telluride reports development work being pushed at the Nellie mine, in Bear creek basin; twenty stamps are dropping.

The Telluride Coal M. Co. has let a contract for driving the tunnel another 100 feet. When this is completed arrangements will be made for building a tramway, 2500 feet in length, from the mine to the railroad at San Miguel. The vein shows nearly 5 feet of a high-grade coal. The Alta mill is treating 100 tons ore per day.

The Four Metals M. Co. owns the Carl Murray group at Telluride and property at Silverton. The company says it will construct its own reduction plants at Telluride and Silverton, these plants to cost \$100,000.

SUMMIT COUNTY.

Near Breckenridge the American Gold Dredging Co.'s dredge in the Swan valley has done good work. The company is now operating on the high banks of the Peabody placer in Gold run gulch.

The Gold Pan Placer M. Co. is handling the heavy seepage water in the pit at Breckenridge. A 1180-gallon capacity valve bucket is being used to unwater the hole, so that the pump can be cleared. The bucket or haller weighs seven tons.

E. E. Busby, superintendent Admiral G. M. Co., 2 miles from Wheeler, is driving a 1200-foot tunnel through hard rock. To drive this tunnel at minimum cost he proposes to put in a 100 H. P. water wheel to run the air compressor for the air drill. The water will be carried out of the Ten-Mile river in a boxed flume, which empties

into a string of 40-inch pipe, which carries the water to pen-stock, where water wheel is located. The Goldpan Co. has the general supervision of placing the plant in position.

TELLER COUNTY.

Cleaning up the low-grade dumps of Cripple Creek district is being pushed by A. H. Heller, who is operating the Arequa mill. So far he has worked over sixteen dumps and recovered \$26,000 in values. The lowest values treated was \$3.50 a ton, the highest \$7 to the ton. At the present time he is working three shifts in the cyanide part of the mill, and is daily treating eighty tons low-grade ore.

The Clinton Con. M. Co. has a tunnel projected 3000 feet to cut Cow mountain at the depth of 2000 feet.

Recent shipment of fifty tons of ore from the Wild Horse mine gave returns of \$25,000 for the shipment.

The recent strike on the Mary Cashen is gaining in value with development.

Work has been resumed on the properties of the Cripple Creek M. & D. Co.

The first annual report of the United States Reduction & Refining Co. was submitted to the stockholders at their first annual meeting on the 24th inst. The company expended \$12,116,195 20 in acquiring the property and plant. The income during the year from the various plants under operation amounts to the sum of \$1,368,673.01. In addition to this amount, the company received as premiums from bonds and interest a sum sufficient to make the income for the year reach the total of \$1,373,849.48. Among the items of expense are the following: General expense of all kinds, legal and official salaries, advertising, taxes, etc., \$152,668 71; cost of maintaining the idle plants for the year, \$13,015 99; cost of organization, \$21,066 99. During the year the company declared two dividends, one on preferred stock, amounting to \$176 886, and the other on common stock, amounting to \$118,038. After paying out the various amounts there was left to be added to the surplus of the company the sum of \$470,809.09. The company, employing chlorination, has made reduction on the old charge for treating the leaner products. Formerly this company charged about \$7 per ton for handling material carrying \$10 per ton or less. The present schedule is \$5.75 per ton, which includes transportation charges from mine to mill.

F. Johnson, general manager Stratton Cripple Creek M. & D. Co., gives the idea that mining operations upon the extensive Stratton estate will go on as usual on the lines laid out in the mind of the late W. S. Stratton when he undertook the work several years ago.

C. C. Hemming has a new option on the Morning Star and Fleming claims for \$50,000.—The United States R. & R. Co. has made a cut on the rate of treatment for low-grade ores of the Cripple Creek district.—A small vein of high-grade ore has been cut on the Elizabeth Cooper claim of the Doctor-Jack Pot Co.

The Little Cut Diamond Con. G. M. Co. has incorporated, taking over the holdings of the Lasca G. M. Co. and the Little Cut Diamond M. & M. Co., Cripple Creek.

At the Empire State, Bull hill, the work on the big veins lately opened is in the nature of development.

T. B. Burbridge will work the C. O. D. Lessees on the Morning Glory property are active and meeting with good success.

Two sets of lessees are making regular shipments from the north end of the Mary McKinney Co.'s property.

Arequa mill is treating the dump rock of the camp on a large scale.

IDAHO.

ELMORE COUNTY.

(Special Correspondence).—The Idaho-Richmond G. M. Co., at Rocky Bar, is doing development work and taking out ore that averages \$60 per ton. They expect to drive a tunnel 600 feet and erect a mill when they have finished the tunnel. The ore they are taking out is paying dividends.

IDAHO COUNTY.

A. Wilson, manager Mayflower Co.'s property at Martin, adjoining Mount Bolland, has a group of locations that have been opened up with such good results that he is now erecting a small gold mill on Lava creek.

R. M. Sherman is manager two new companies to work the American Eagle and Fish Hawk groups on Siegel creek, about 9 miles south of Elk City. He has bought from Finch & Campbell the 10-stamp mill which they erected on the Ajax property, in Dixie. This mill will be moved to Siegel creek.

LEMHI COUNTY.

At the gold-bearing properties of the Eudora M. Co., 5 miles north of Salmon City, Manager W. A. Stanton, who is owner of a half interest, will erect a cyanide plant, the appearance of one-half of 1% lead having made it necessary to abandon

amalgamation, which has been going on in a 10-stamp mill erected a short time ago, the new plant to treat fifty tons daily at the start and to cost about \$28,000.

LINCOLN COUNTY.

At Minidoka two dredgers are being worked continuously by Burroughs Bros., by which 5000 yards of gravel are being daily handled with success. Along the margins of Snake river many are washing the sands with rockers and earning day's wages.

SHOSHONE COUNTY.

(Special Correspondence).—The Gold Hunter M. & S. Co. here are daily treating about 100 tons of crude ore in their mill, employing sixty men. They are shipping the concentrates to the American S. & R. Co. J. S. Olin is superintendent. The Gold Hunter Co. has been operating the Yolande claim, taking out ore hut parties owning five-sixteenths of the Yolande have an injunction against the company enjoining them from taking out any more ore. The report is current that the Gold Hunter has no ore; that all the ore they have taken out was from the Yolande. The Hunter, it is claimed by the management, has plenty of ore, and they will continue to operate on their own claims. They developed the Yolande while working the Hunter. They have a shaft on the Yolande through which they take the ore from the Hunter. The Gold Hunter people own eleven-sixteenths of the Yolande.

Mullan, Sept. 20.

The Cœur d'Alene reports a settlement of the dispute between the Cœur d'Alene mine owners and the smelting trust. The railways consent to reduce the freights \$2 a ton, and the smelting company makes a cut of \$1 a ton on its charges. In addition there are other concessions which make the reductions amount to about \$4 a ton in the case of most of the mines. At the same time, the mine owners get the right to increase their shipments in the aggregate from about 8000 to 12,000 tons a month. Shipments under the new scale have begun. It is expected the force of men in the mines affected will be increased about 25%. The new arrangement is expected to mean increased profit to the mine owners amounting to \$100,000 a month, or \$1,200,000 a year. This is done without raising the price of lead, which is fixed at 3½ cents a pound. The conference at Chicago was attended by D. M. Hayman, president Frisco Con. Co., representing the mine owners; Traffic Director Stubbs, representing the Harriman lines; a representative of the Hill interests and of the smelting trust.

C. Sweeney of the Empire State-Idaho Co. says: "The settlement is rather complicated. Under the old schedule the ore was taxed a flat rate of \$9 a ton for treatment, but the freight charges were graduated and were \$10 for ore carrying less than \$50 a ton, on the basis of the full valuation for the metal contents; \$12 for ore carrying between \$50 and \$65 and \$14 for ore carrying more than \$65. Under the terms of that, most of the shipments from the Cœur d'Alenes took the middle class rate, amounting in all to \$21 a ton. Now the railways cut the rate \$2 a ton for freight in each case, and the smelter lowers its treatment charge to \$8 a ton, which means a cut of \$1. In addition there is an important change in fixing the manner in which the determination of the freight rate is fixed. The smelters have always paid for only 90% of the lead contents and 95% of the silver values in the ore. Suppose that the ore carries 58% lead and twenty-five ounces silver. At 3½ cents a pound for lead and 50 cents for silver, the total assay value of it is about \$53 50. However, the amount which the smelters would pay for the ore would be considerably less than \$53 50, since there is the 10% toll on lead and the 5% deduction on silver. With these deductions made, the ore runs less than \$50 a ton. Under the new deal the value of the ore is supposed to be, not its full contents, but the price after deductions by the smelter have been made. Therefore, in this case, the freight and treatment rate now would be \$16 a ton, instead of \$21 a ton, as formerly. That is a cut of \$5 a ton. In other cases the cut is only \$3 a ton; so we take \$4 a ton as the average reduction. We are also allowed substantial increases in the amount of ore which we can ship. Under the new arrangements there is a nominal limit of 4000 tons a month, which is an increase of just 50%. That means practically that we can ship up to the full capacity of the mines. We shall increase our force about one-third in order to handle the increased output."

The Standard and the Hecla are now allotted 2600 tons a month. They can ship up to 3000 tons. The Morning is raised from 2000 to 3000 tons. The other properties are increased correspondingly. Secretary Brush of the American S. & R. Co. says: "The lead miners of the Cœur d'Alenes can not build rival plants,

because we have signed a contract with them for a whole year ahead. Contracts last year were for 8000 tons a month. Since May the output has been 10,000 per month and our contracts for next year call for 12,000. We have a contract with all the mines except one, which sends ore to the Pacific coast. There is no possibility of the establishment of rival plants, and I think the amount of ore contracted for will be more than the Cœur d'Alenes can produce."

There will be a meeting of the stockholders of the Standard and the Hecla companies on Oct. 6 to act upon the plan for consolidating the two companies, with a capital of \$3,000,000.

Injunction has been issued restraining the Gold Hunter M. & S. Co. from taking any ore from the Yolande claim, which adjoins the Hunter M. Co.'s property at Mullan. A mining engineer makes affidavit that from Sept. 21, 1899, the alleged time the Gold Hunter M. Co. started operations on the Yolande claim, the company had, up to the month of January, 1900, taken 15,906 tons of ore, valued at \$1,034,000, from the property, and that from that time until April 5, 1902, the company had taken out 7986 tons of ore, valued at \$480,000. I. L. Magee is manager Yolande M. Co.

Near Murray, the Paragon people are considering the construction of a concentrator next season, daily capacity fifty tons. They are sinking a shaft; at its completion a crosscut will be made to tap the ledge at a depth of 480 feet. About 1800 feet of work has already been done on the property in the way of crosscutting and tunneling; hoisting machinery is put in and a four-drill compressor will be installed.

The Cœur d'Alene M. Co. expects that its 5-mile ditch on the side of the hill to the north of the town, and which is to carry water to the placer grounds at the mouth of Dream gulch, will be completed Nov. 1. The company controls 3000 acres of land, and it is estimated that the gravel will yield 5 cents per square yard. The company is working forty men in the bed of Prichard creek; the bedrock there is 30 feet deep.

MICHIGAN.

HOUGHTON COUNTY.

The Lake Superior smelting works at Dollar bay are using coke instead of anthracite coal in the smelters, because of the coal strike. The same works are turning out Isle Royale copper in anodes for the recovery of silver by the electrolytic process, and are now casting the August product into anodes.

MONTANA.

CASCADE COUNTY.

C. W. Clark is securing a site for an additional smelter at Great Falls.

DEER LODGE COUNTY.

Work is resumed in the Cable property at Moose mining district, northwest of Anaconda. The property has not been worked since 1889, when it was closed down indefinitely. The property is under the charge of J. C. Savery, principal owner. Thirty men are employed at the Cable, under Superintendent Bacon.

FERGUS COUNTY.

R. E. Moulton projects a cyanide plant on the Alameda group of claims, near Gilt Edge.

GRANITE COUNTY.

(Special Correspondence).—The Montana G. M. Co. of Butte have recently brought in several retorts from their property, near Princeton, that averaged from \$900 to \$1200 each. They are still sinking the shaft and expect to go about 100 feet deeper.

Princeton, Sept. 21.

The Montana G. M. Co. has five claims 25 miles from Philipsburg. The Sunday claim is being developed; a shaft is 100 feet deep and a tunnel is in 450 feet from the entrance. The shaft and tunnel are connected at a point 400 feet from the mouth of the latter.

Murray & Miller, lessees of the Lead King properties at Garnet, have a load of ore, on which the smelter returns yielded them \$184 per ton. The Lead King has been developed to a depth of more than 500 feet, the vein showing strong.

L. S. Parker has a lease on the Shamrock at Garnet, and will sink another shaft and also drift for the pay ore.

JEFFERSON COUNTY.

W. A. Clark is working the Mayflower, near Whitehall. The shaft is more than 1000 feet deep. Much of the ore is rich, some of it averaging \$300 per ton in gold, which is the only metal the rock contains. Some tellurium ore has been found in the property. In only a few places in Montana has this class of rock been discovered. A few samples taken from the Mayflower were valued at \$10 per pound. Several tons worth \$100 each were

shipped from the Mayflower to the Butte reduction works two years ago.

LEWIS AND CLARKE COUNTY.

Fire destroyed the plant of the Columbia G. M. Co. at York, near Helena, last week; loss, \$35,000. The 10-stamp mill and the cyanide plant were destroyed; \$14,000 insurance. About 150 men were at work. If the company decides to rebuild, six months will be required.

MADISON COUNTY.

Ten Minneapolis men have bought the Galena mining property, 12 miles from Pony, 3 miles from Norris, for \$60,000. The Galena comprises two claims containing a vein of ore from which a quantity of gold has been taken by leasers. It is the intention of the new owners to begin active development at once under the direction of J. H. Briggs, who will stay with the proposition a year. Sinking will be continued to 1500 feet. A reduction plant will be built to treat the product, provided the showing warrants.

MISSOULA COUNTY.

Near De Borgia, the Deep Creek G. M. Co. has shut down its hydraulic elevator for the season. The men will be engaged in putting in new blocks in the flume, the old ones being worn out after two seasons' run. Manager D. Cromie says white pine will be used for the work, as it is more satisfactory than cedar.

SILVER BURR COUNTY.

Manager Wethey will rebuild the Butte Reduction Works at Butte.

NEVADA.

ESMERALDA COUNTY.

L. K. Mau, one of the original locators of the Pactolus group of mines, 35 miles from Luning, is in San Francisco to bring California men to Luning with a view to purchasing the property.

EUREKA COUNTY.

During the week ending September 12 the shipments of ore by rail from Eureka district amounted to 35,710 pounds from the Excelsior mine and 163,570 pounds from the Eureka Con.

HUMBOLDT COUNTY.

Raser City, the scene of the Donnelly mountain strike, has twenty-five men doing assessment work. There are no deep shafts or tunnels in the camp. No work of a permanent character will be undertaken before spring. About 200 tons of \$60 ore are sacked on the dumps. There are six ledges so far discovered, some 2 feet in width.

LINCOLN COUNTY.

Searchlight is on the western slope of the Opal mountains and near the center of a mineral belt, from El Dorado canyon 30 miles to the north to Newberry mountain, 25 miles to the south; width about 15 miles bounded on the east by the Colorado river. The country rock is chiefly porphyry and granite. The largest concern operating in the camp is the Quartzette Co. of Boston, Mass. The company owns several patented claims, a 20-stamp mill at the river, connected by a railway 12 miles long, with their chief mine, the Golden Treasure, in which 4000 feet of work has been done, proving the ledge by shafts and drifts. Their shaft is down 500 feet on the ledge and is being sunk deeper. On the 500-foot level the ore is wider and richer than in the upper levels. The July run at the mill was 1400 tons of ore, which yielded \$4000 in bullion. Between the 400 and 500-foot level the ledge is over 30 feet wide.

The Southern Nevada M. & M. Co. has the Blossom, 3 miles north of the Golden Treasure. They have 10 stamps in operation.

The Duplex Co. is working the Searchlight mine down nearly 400 feet with their shaft. When they reach the 400 foot level they intend putting in a pump and expect to have plenty of water to operate their 10-stamp mill, now erected and ready to commence work. The survey of the Salt Lake Railroad and Oregon Short Line is within 20 miles of this district.

At Silver King mining district, 45 miles northwest of Pioche, the Silver King reports an ore body 9 feet in width, carrying 6000 ounces silver per ton, creating a stampede from Pioche to that district.

The organization of Bamherger's De Lamar's mines has been perfected and the shares distributed among the members of the Eastern syndicate which controls the property.

LYON COUNTY.

The Oakland Con. G. & S. M. Co., Dayton, represented by Wiltz & Paramore, will timber the tunnel, put up buildings and develop the mine.

In the Nevada Chief mine, Rockland, in tunnel No. 1, on the new ore body, in an upraise, the ledge is 4 feet wide and there is a 20-inch vein, from which ore is being sacked for milling.

NYE COUNTY.

In twenty mining claims belonging to

Griffin & Cutting, 11 miles west and 12 miles south of Tonopah, the country rock is porphyry, schist and lime. From the deepest prospect opening so far half a carload of shipping ore has been extracted, showing 400 ounces silver per ton and \$30 per ton gold. There is a small percentage of lead in some of the ore. Water is scarce and a long way off.

The Bonanza says at the Fraction development work is progressing with sixty men. No. 1 shaft is near the 400 mark. At the big shaft they expect to reach the 400-foot before Nov. 1. They are doing fast work putting in a sot a day at this shaft and are sinking at the rate of 5 feet every twenty-four hours. Two hundred sacks of ore await shipment.

STOREY COUNTY.

The water in the Chollar Combination shaft on the Comstock stands 160 feet 4 inches below the measuring point. At the C. & C. shaft the water is being held at a convenient point below the 2150 level. Elevator No. 2 was recently taken up and a new throat piece and nozzle added to its length, after which this elevator was lowered into place and is now in steady operation, except when stopped a few hours each day to save pressure water.

P. L. Flanagan says he has bought from the Donner L. & W. Co. at Lake Tahoe the Van Schmitt dam for \$40,000, the Nevada P. & L. Co. to pay \$22,500 and the residents on the meadows to pay the balance.

Recently miners of Storey county made a protest against the S. P. railroad securing a patent on land of more value for mineral than agriculture. The matter was given a hearing before Register Gallup and the railroad withdrew the disputed land from the map, which leaves it free to the miners. The miners placed two men on the stand who testified to the worth of the land for its prospective sources. Mr. Fulton, who represented the company, did not make a contest of the matter and allowed the miners all they claimed.

WASHOE COUNTY.

Manager Hopkins of the Great Western M. Co. at Steamboat Springs has installed heavier machinery and believes there will be no difficulty handling the hot water in sinking the three-compartment shaft deeper.

The clean-up from the first run of ore from the Wedekind and Bell mines returned 4600 pounds bullion, proportion of gold one ounce in each 100 ounces of silver.

WHITE PINE COUNTY.

F. C. Williams, manager Ohio G. M. & L. Co., has a \$50,000 bond and lease for one year on a mining claim at Ely, containing a deposit of tungsten.

NEW MEXICO.

GRANT COUNTY.

The Kat & Kittens M. Co., of which G. A. Freeman of Cooney was manager, has passed into the hands of the Home G. & C. Co., a corporation of Canada. It is expected to sink the 150-foot shaft 130 feet deeper and do crosscutting. If the results are then satisfactory a cyanide mill will be erected.

R. H. Batchelder says a new company has been organized to build a smelter at Aberdeen, composed of Philadelphia men, to exploit a process of lead smelting invented by C. Wessell, which is claimed to be more economical than the present process.

OREGON.

BAKER COUNTY.

J. P. McGuigan, general manager Alamo Con. M. & M. Co.'s property at Alamo, 23 miles from Sumpter, will build a 20-stamp mill there this fall.

At Baker City, G. W. Daines, of the Daines M. & M. Co., says he will this fall erect new machinery on the property in the Greenhorn district, known as the Belcher, including a stamp mill of sufficient capacity to take care of the ore.

P. R. Bishop is superintending development work at the Climax mine, Cracker Creek district.

Sumpter reports a strike in the Cracker Oregon mine, owned by the Turnagain Arm Co. of Minneapolis. The ledge is 3 feet wide.

GRANT COUNTY.

(Special Correspondence) — The Red Boy Con. G. M. Co., head office at Baker City, mines and plants at Lawton, is now developing its water rights, which cover the principal streams and natural reservoirs within a drainage area of 60 square miles. The largest reservoir, which is Olive lake, has a storage capacity of 83,000,000 cubic feet. The water will be used under a natural head of 770 feet and will develop 2000 H. P.

More than 10,000 feet of development work has been done on these properties. At a depth of 700 feet the veins are united and have a width of over 16 feet. The mine was equipped at a cost of \$225,000. The steam plant consists of three boilers,

20x48 Corliss engine running hoist, air compressor, 20x36 Corliss engine running compressor, air receivers, pumps, drills, etc. The mill consists of a 25-stamp battery with a capacity of sixty to eighty tons per day, eight concentrators and crushing machinery. A cyanide plant treats the concentrates from the mill. E. Juessen, Spokane, Wash., is consulting engineer.

Baker City, Sept. 20.

JOSEPHINE COUNTY.

The Alameda M. Co., Galice district, have four quartz claims and fifty acres of gravel lands. They have let a contract for running a long tunnel to C. B. Mattison.

LANE COUNTY.

In Fohemia mining district there are three stamp mills running at the Helena, Musick and Champion, all owned by the Oregon Securities Co. Twenty teams are hauling ore and concentrates to the end of the railroad. The Knob mine is in operation. The Le Roy Co. has put in the first steam drill of the district in its group of eight claims. The greatest depth is in the levels of the Musick, 400 feet, and the Helena is down about as far. The Oregon & Southeastern Railroad is completed 12 miles from Cottage Grove and 10 miles more will be finished this year. It will be 38 miles long and will be entirely finished next year. A company has been organized by P. J. Jennings to cut a tunnel 1 1/2 mile long from the head of Champion basin through Grouse mountain to tap the Helena and Musick and bring the ore to the terminus of the railroad.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Carbonate Silver Extraction Co. is working the tallings at the old Iron Hill stamp mill in Carbonate camp. The ore carries an average of twelve ounces of silver to the ton. It is possible to leach four to five tanks a day. The company is obtaining an extraction of 75% to 85%.

At Lead, the Pluma G. M. Co. has bought the Hawkeye M. Co., and is planning extensive operations. The Hawkeye property, which includes nine acres of millsite, on which is the 40-stamp mill at Pluma. The ground joins that of the Pluma Company, in northeast Lead, and, with the Pluma, is surrounded by the property of the Homestake. This purchase gives the Pluma Company eighty-six acres, figuring in two millsites, both at Pluma. The Hawkeye mill is connected with the Hawkeye mine by a cable tramway 4600 feet long, which crosses the original Pluma group, and will be used exclusively in the conveyance of ore from the various mines. The mill is 500 feet lower than the mine. Forty more stamps will be added to the mill for cement ore, that lies across the Hawkeye and Pluma groups of claims. The old Pluma mill is 20-stamp, up Whitewood creek from the Hawkeye. In this mill a test run was recently made on cement ore; average value \$5 42 a ton. The company says it can convert this into bullion and deposit it in the United States assay offices at Deadwood for \$1.75 a ton.

At Terry, the Horseshoe M. Co. has begun excavating for the cyanide and stamp mill above the Mogul shaft in the Bald mountain district. The completed mill will be of 1000 tons capacity; 500 tons will be pushed to completion as soon as possible and the rest finished later. One hundred and twenty stamps will be put up now and 240 by Jan. 1st. The plant will be in two separate buildings, one to comprise the power house and crusher, the other the stamps and cyanide tanks. The ore will be carried by belt conveyors from the crushing plant to the cyanide plant, 80 feet square; the first part of the cyanide plant 450x250 feet, the finished plant to be 150 feet square. The B. & M. R. R. will begin spur tracks as soon as the mill is laid out. C. M. Fuller of Denver will have charge of the construction of the plant. H. Collins is foreman. A. Guionneau is engaged on the new plant. R. W. Rodda is superintendent.

UTAH.

BEAVER COUNTY.

Near Milford, at the Ben Harrison mine, twenty-four men are installing the new machinery and doing development work.

IRON COUNTY.

Leaching the ores of the Ophir M. Co., at Stateline, is to be relegated to the plain cyanide process. Superintendent Parker says with the use of cyanide a saving of 90% is possible. The hyposulphite process afforded a saving of 85%.

JUAB COUNTY.

(Special Correspondence).—The Centennial-Eureka M. Co., Eureka, are producing seventy-five to eighty tons per day, and have already shipped to United States smelter at Bingham Junction about 400 tons. They are now loading the second

lot for shipment. They only have part of a force working at present, but as soon as the smelter is completed and in operation will put on a full force.

Eureka, Sept. 23.

Manager McIntyre has run an upraise in the new channel of gold-bearing ore at the property of the Mammoth M. Co. Tintic, with the rock maintaining a satisfactory average; a recent carload of ore brought \$9000 at the smelter.

At the Lower Mammoth, Tintic, controls show 121 ounces of silver, 6 3/4% copper and 90 cents gold, the ore having a gross valuation of \$67 62 per ton.

Near Silver City, the Dragon Iron mine, L. E. Ritter, manager, sends 100 tons of flux daily to the furnaces of the American Smelting & Refining Co.

SALT LAKE COUNTY.

The New Red Wing Co., at Bingham, has two new ore bodies. Manager Orem says in virgin ground at a vertical depth of 400 feet from the surface in the Silver Hill ledge the lessees are wheeling out ore that averages 45% lead, fifteen ounces silver and \$1 gold per ton.

The management of the York Co.'s Bingham property, after driving west from the main Petro incline 1000 feet, has encountered the ore body looked for at a point over 1000 feet below the apex of the ledge.

On the authority of a local smelter manager the Tribune states that the furnaces of Salt Lake valley are consuming 2000 tons of ore daily, with the tonnages, flux and fuel increasing it to 3000, yet the capacity of the plant is being daily increased. It is estimated that nearly 10,000 mouths derive their food through one or another of the various avenues radiating from the smelter furnaces. There are four more to be blown in at Murray's \$1,000,000 plant, one more of those now installed at the Bingham Con., with the battery of five, with which the new \$650,000 smelter being completed by the United States Smelting Co., to follow. Out of Milford the Majestic Co. is engaged in the erection of another independent smelter and still another is projected by the Newhouse interests at Frisco and Bingham.

SUMMIT COUNTY.

(Special Correspondence).—The Ontario S. & M. Co. are now down in shaft No. 3 1900 feet, and expect to sink same to 2000-foot station; also doing a great deal of prospecting and development work. Shipping 2000 tons to 2800 tons of ore per month; employ 200 men.

Park City, Sept. 23.

Manager Brooks figures that five cars of concentrates from the California M. Co., 135 tons, averages \$45 per ton, lead, silver and gold.

The Park Record reports shipments of ore from the Mackintosh sampler for the past week as follows:

	Pounds.
Daly West.....	2,604,000
Ontario.....	1,014,000
Anchor Con.....	439,000
California.....	51,000
Loring.....	150,000

Total number of pounds.....4,258,000
Silver King.....1,440,100

Grand total.....5,698,100

WASHINGTON COUNTY.

R. C. Lund says the wagon road between the Dixie mines and the site for the new smelter is completed.

At Silver Reef the new cyanide mill is in process of construction.

WASHINGTON.

OKANOGAN COUNTY.

W. H. Plummer, president Methow R. & S. Co., says he will build a railroad from Pateros up the Methow valley.

PIERCE COUNTY.

The Pacific Improvement Co. has cut the price of Carbon Hill coal to steamers at Tacoma and Seattle. Heretofore the coal operators have been getting an average of \$3 25 per ton for coal furnished steamers at that port. The local managers of the Carbonado mines have now entered the fields and offer to supply steamers coal at \$2 10. Some of the competing mines are meeting the rate, while part of them are playing a waiting game. It is claimed that the coal cannot be mined and sold for \$2 10 at a profit, and that the Pacific Improvement Co. must soon increase price. Before the adoption of oil by the Southern Pacific, the entire output of the Carbon Hill mines was shipped from Tacoma to Oakland, Cal., being used largely on the Southern Pacific ferries. When oil came into use about a year ago, the mines at Carbonado were closed down.

SNOHOMISH COUNTY.

The Northern Pacific railroad has bought of J. D. Rockefeller the Everett & Monte Cristo railroad, 60 miles in length, from Everett to the Monte Cristo mines. The road was built ten years ago, after

Rockefeller had purchased the Monte Cristo mines. It lost money for several years, but is now on a paying basis.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence)—In the Oyster group of mines at Camborn, on Fish river, consisting of the Rossland and Criterion claims, owned by Wm. Pool, is struck free gold ore in the quartz lead.

The N. W. D. Co. of Michigan, who own the Camborn group, will put in a 10-stamp mill and large saw mill and develop their properties.

The John L., at Gerrard, on Tenderfoot creek, will put up a concentrating mill.

The Guena G. M. Co., on the Duncan Slope at Ferguson, have some high-grade gray copper ore.

The Silver Cup mine at Ferguson recently made a shipment of 1200 tons to the Trail smelter, netting \$195,000. They struck a body of gray copper ore in the 400-foot level.

The Metropolitan M. & M. Co. at Trout Lake are working the Triune and Metropolitan, and have 4 feet of gray copper in the Triune which will average about 300 ounces silver to the ton.

Ferguson, Sept. 20.

The Sullivan smelter at Marysville is expected to be in active operation within ninety days. The Canadian Pacific originally signed a contract to deliver the Sullivan ore to the smelter for 62½ cents per ton, and to that end began the survey for a railroad. Later it was found impossible to build the road, as the grade could not be eliminated sufficiently within the 6 miles traversed. As there was no special mode of delivery specified in the contract, the railroad company now is building a tramway to convey the ore. This will be but 1½ miles long and will cost \$27,000, as against \$150,000, the cost originally estimated for the completion of the railroad.

Slocan says the Enterprise mines will supplement its concentrating plant on Ten Mile with the Elmore oil process.

At Moyle the St. Eugene mine is closed down, the pump pulled out of the shaft, the machine drills taken out of the mine and cleaned and put away and the miners all given their time. Two men will be employed to watch the mine. Two years ago the company was employing nearly 300 men and its monthly payroll was between \$25,000 and \$30,000. It was shipping on an average of 2000 tons of concentrates every month, of a gross value of \$70 per ton. The fall in price accounts for the closing down of the mine. Manager Cronin says that the London price of lead must reach the £13 mark before a wheel will turn.

Rossland advances the suggestion that British Columbia lead producers form a combine in Canada and construct a smelter south of the boundary line to buy Canadian lead ore exclusively. The duty on lead ore is 1½ cent per pound; at this figure the Canadian lead miner would receive about \$250 for his product—\$1 per hundred higher than he obtains after marketing his lead on the London market and paying the reduction and freight charges. It is asserted that the miners would, as a set-off to the duty, have such profits as accrued to the smelter under existing conditions.

J. H. Mackenzie, general manager Le Roi mine and Northport smelter, on the coke supply question, says: The Crow's Nest Coal Co. controls workings at Fernie, Michel and Morrissey. At Michel there are 212 coke ovens now operating to their aggregate capacity. At Fernie there are 324 ovens, of which 160 are in full blast. At Morrissey there are no coke ovens, but the mines are producing large quantities of coal. The Crow's Nest Coal Co., therefore, has only sufficient coal on hand to operate 388 of its coke ovens out of a total of 536 ovens available, the reason for this being that the dark ovens are located at Fernie, while the coal to keep them running is at Morrissey. The ovens now blown in produce 450 tons of coke per diem, while the possible production of the entire equipment of ovens is sixty-seven tons of coke daily. If the coal company is enabled to secure a rate for the transportation of coking coal from Morrissey, where it has an ample tonnage now unused, to Fernie, where it has 164 coke ovens lying idle for want of coal to blow in with, their output of coke will immediately be raised to the maximum tonnage of 670 tons daily. Approximately, the requirements of the Kootenay smelters is 360 tons daily, making it evident that if the coal company is thus able to keep all its coke ovens in operation it will have over 300 tons of coke daily wherewith to supply the demand outside of the Kootenays, of which the Northport smelter, with a consumption of 200 tons of coke daily, is the principal factor. The Northport smelter is so closely identified with Rossland that it may be regarded as a British Columbia enterprise. One and six-tenths ton of coal is

required to manufacture a ton of coke; the charge of the individual ovens is six tons and seventy-two hours are consumed in the process of converting coal into coke; under the new management the miners are supplied with all the cars they require to move the coal broken down in the stoves, and in other particulars their operations are so expedited as to largely enhance their earning powers. Where men were only able to produce four to five tons of coal daily they are able to produce nine tons or thereabouts, and their remuneration is largely increased as a result. This practically amounts to a considerable increase in wages.

Phoenix says over 10,000 tons of ore have been sent out to local smelters in the last seven days. The Sunset smelter has again blown in and the Mother Lode smelter has put in its second furnace blast.

This week the Granby smelter treated 4930 tons, a total of 212,310 tons for the year.

The report of the operations of the Le Roi mine and Northport smelter for July shows tonnage shipped from the mine in July of first-class ore 14,492 7, second-class 1677.5 tons, aggregate 16,170.2. First-class ore averaged \$17.67 per ton, second-class \$16.35. During the month the expenditure on mine account was \$51,385.53. The cost of breaking and delivering ore on the railroad cars for the month was \$2.87 per ton. The cost of loading second-class ore from the dump was 27.3 cents, which, added to the 2½ cent tax for the month, brings it to 29.3 cents per ton. The cost of delivering first-class ore on railroad cars, including all mine expenditure other than cost of second-class ore, was \$3.50 per ton.

Trail reports regular ore shipments averaging 400 tons daily received at the smelter, but inconvenience experienced through a shortage of coke. The roast heaps are growing, but coke is not coming in fast enough to justify the blowing in of the copper furnaces. Two furnaces are in readiness to start, but will not be blown in until regular supply of coke is received.

The Ball Mountain mines, near Donald, have been sold for \$1,000,000.

Paragraph 2 of Section 5 of the Mineral Act Amendment Act, 1898, is interpreted that, should any free miner perform assessment work on his claim during any one year to the value of one hundred dollars or more in excess of the amount required to be done in any one year by the Mineral Act, the right thereby given such free miner of recording a certificate of work done to the value of each one hundred dollars, so as to cover his assessment work for an additional year in respect of each one hundred dollars in excess, is exercisable only during the year in which such excess shall be performed.

The report from the Northport smelter shows that 22,625.1 tons were received at the plant during July. Of this 19,965 tons was treated as follows: Roasted ores, 10,764.5 tons; raw Le Roi No. 2, 5008; raw Le Roi second-class, 2268 5; raw Le Roi first class, 1908. The gross value of the first-class ore treated in July is placed at \$256,086, and the net estimated profits on this class of ore is given at \$92,898 42. The gross value of dump ore was \$27,427.68. The estimated profits on this ore was \$15,450 09, the total estimated profits being \$108,348.51.

MEXICO.

BAJA CALIFORNIA.

At Alamo, on Aurora-Princessa mines, the 10-stamp mill on the property is worked fifteen hours a day. The company proposes to sink another 50 feet; total depth, 350 feet. The company is also sinking a new shaft on the Viznaga mine. The 10-stamp mill of the Viznaga mine is preparing to crush.

CHIHUAHUA.

The Boston & Chihuahua M. Co., organized under the laws of Colorado, will develop the Shamrock annexes of sixty pertenencias at Terrazas. G. W. Boyce is manager of the properties and will put in air compressors and hoists.

COAHUILA.

Trouble is reported at the Avino mines as a result of the importation of Chinese laborers to take the place of the Mexican furnace men, who have threatened to strike. A detachment of rurales was sent to the mines on the appeal of Manager Flynn for protection. For several months the furnace men have been dissatisfied. Recently they demanded better pay. Avino is in the mountains, 13 miles from the railroad. The engagement of the Chinese was made through Torreon agents. There is little difficulty in getting the men, but the question of getting them to work without trouble is another matter. There is little doubt that the management will give them a chance to work, even if there should be no strike. It is not probable that there will be serious trouble at the mines.

SONORA.

Phelps, Dodge & Co. have begun development work on the Indiana-Sonora property at Cananea, by sinking six shafts. The camp is prosperous and continues to grow rapidly.

SOUTH AFRICA.

A dispatch from Johannesburg says that Mr. Rathbone, former Government Inspector of the Rand mines, has returned from a geological survey of the southern fringe of the great Witwatersrand basin. He established the existence of the main reef series through 20 miles which is favorably situated for working. The dispatch adds that, should the reports prove true, it means another Rand with the existence of all deep levels geologically proved.

Late London advices say the Government has decided that the new South African colonies are to be required to pay \$500,000,000 toward the cost of the South African war. The colonies are, however, to be allowed ample time in which to make this payment. It will not be collected until the extension of trade and expansion of revenue permit. Consequently the loan will not be floated for two or three years. Mining profits will probably be taxed 10% more than they were before the war, and money will also be obtained by granting all kinds of concessions and mineral rights.

SOUTH AMERICA.

BRAZIL.

U. S. Consul H. W. Furniss of Bahia, Brazil, reports upon diamonds and carbons, the latter being the stones used in diamond drills. The rock is eruptive; the carbon, by great heat and pressure, has crystallized into diamonds. With conditions perfect the diamond of commerce was produced; with less perfect conditions the carbon failed to crystallize and appears in hard, blackish masses of irregular shape, known in trade as carbon or black diamonds. The original rock is granitic, and mixed with this is a sandstone of different degrees of hardness and a conglomerate of rounded pebbles cemented by a very hard matrix, often resembling a dark-colored cement. Both sandstone and conglomerate are of more recent formation than the granite, and they contain the diamonds. These precious stones are thus not found in situ, but occupy their position as a result of fluvial action. The diamonds and carbons cannot be removed from either the sandstone or conglomerate because of the impracticability of breaking the rock without crushing the precious stones. The miners, therefore, work in the gullies between the rocks and in the cavities about them, depending upon the disintegrating influence of time and the elements, and the washing down of this debris into the ravines and river beds. The method of mining there employed is of a crude type. The cascalho or diamond-producing debris is mined in the open or by tunnels, and at the end of each week this accumulation is laboriously washed, either in a sluice with running water or in large wooden basins manipulated by hand. In another method of mining a diving bell is used, and in the Paragua river, near Tamandua, 100 native divers work the river bed, collecting the gravel into sacks, which are hoisted into canoes and taken ashore. Mr. Furniss says that, with improved machinery and modern methods, much better results could be secured. Some of the most productive locations cannot be worked because the water leaks in faster than it can be bailed out by hand; here, even, a good hand pump would much improve conditions.

The output of carbons now averages about 2500 carats per month, but the output is decreasing while the demand is constantly increasing. Mr. Furniss says that immense quantities of carbons exist in that region, but it will take well managed companies with large capital to mine them profitably. Carbons are classified as porous, or crystalline and good. The good stones are now worth at the mines \$24 per carat, if the stone is over ½ carat in weight; for stones of ½-carat to ¼ carat the price is \$7.20 per carat; carbons of less than ½-carat are mixed with refugio diamonds, worth \$48 per oitava. The porous carbons bring half these figures, but not more than 5% of the stones mined belong to this class. The largest carbon ever discovered came from the Lencoes district; it was found in 1895, and weighed 3150 carats. It was sold by the miner for \$16,000, one-fourth of this going to the owner of the claim; this stone was finally sold for \$25,400 and sent to Paris to be broken up into marketable pieces. The next big find was in 1901, when near the same place as before a carbon of 577 carats was unearthed; this was sold by the miner for \$17,380. The average size of the carbons found is six carats. All diamonds and carbons from that district are shipped to Paris and London from Bahia City.

THE KLONDIKE.

George Anderson, the Dominion Government trade commissioner to the Yukon, says that the output of gold in the Klondike region this year will be \$11,000,000 to \$12,000,000, or \$6,000,000 less than last year. The Canadians, he says, now control 70% of the trade of the British Northwest Territory.

Personal.

J. KENT is manager Elia M. Co., Telluride, Colo.

J. B. PAXTON has returned from Taos, N. M., to Joplin, Mo.

GEO. STEUART is now manager Purlitan mine, Yankee, Colo.

J. M. MCPHEE is superintendent Golden Wizard mine, McEwen, Or.

W. M. BREWER is ore buyer for the new Crofton, B. C., smelter.

F. E. LLOYD is superintendent Arizona G. & C. Co., Patagonia, Ariz.

HENRY PAULSEN is manager Standard S. & R. Co., Val Verde, Ariz.

M. H. JACOBS, Idaho State Mine Inspector, is in Spokane, Wash.

C. HENLEY of Central City, S. D., has gone to Ashantee, West Africa.

W. F. ENGLEBRIGHT has returned from Bear Valley to Nevada City, Cal.

L. CUMMINS is now superintendent Alpha Con. mines, Coarse Gold, Cal.

J. C. COX of Aspen is now assayer and chemist Camp Bird mine, Ouray, Colo.

E. BAMBERGER is superintendent Keystone Co.'s property, Park City, Utah.

C. P. ROSECRANS, manager Standard Copper Co., Clifton, Ariz., is at San Jose, Cal.

C. H. LINDLEY of San Francisco is in the Cœur d'Alenes, Idaho, on legal business.

F. R. WARDLE has returned to San Francisco from a two years' sojourn in the Orient.

C. S. MILLER has been appointed superintendent of the Arastra M. Co., Granite, Or.

J. B. GRIMWOOD is constructing engineer Nevada County, Cal., Gas & Electric Co.

S. V. SHERROD has taken charge of the Bolonitos group of mines, Guanajuato, Mexico.

J. N. MOSELY of Wardner, Idaho, has gone to Lima, Peru, on a prospecting expedition.

GEO. JOHNSTON of San Francisco is installing mining machinery in Placer county, Cal.

J. T. KESCEL, late foreman Anchor mill, Park City, Utah, is succeeded by W. Nichols.

A. HOULE has assumed charge as superintendent of the smelting works at Encampment, Wyo.

G. Z. EDWARDS, general superintendent Con. Mercur, Utah, gold mines and mills, is in New York City.

GEO. E. SANDERS of the Oro Grande mine has returned from New York City to Wickenburg, Ariz.

H. C. DONALD is general manager Silver Knight and Clifford property, East Klondike, Tonopah, Nev.

W. W. O'BRIEN has been appointed superintendent Stratton's Independence mine, Cripple Creek, Colo.

J. N. MCLEOD is in charge of the assaying department Miners' Ore Sampling Works, Black Hawk, Colo.

F. BOYLE is now superintendent Ivers-Judge group of mines, White Pine county, Nev., succeeding J. Weber.

H. L. SHIPPY of the John A. Roebing's Sons Co. has returned to New York City from a visit to London.

SUPERINTENDENT N. JUDSON of the Yankee Hill G. M. Co. has returned from Los Angeles to Columbia, Cal.

O. P. POSEY is at the Gold Roads group, Kingman, Ariz., where a large plant of mining machinery is to be placed.

PERCY L. FEARN, M. E., of New York, is in Idaho examining some gold properties in the interest of foreign capital.

S. A. KNOWLES is foreman Sun & Moon mine, Idaho Springs, Colo., succeeding A. Clute, who goes to southern California.

R. LIDEN, assistant superintendent British Columbia Co., has returned to Greenwood, B. C., from Spokane, Wash.

T. B. O'BRIEN of Madison county, Mont., is in Butte with tellurium ore, valued at \$10 a pound, from the Mayflower mine.

A. C. HUMPHREYS is now president Stevens Institute of Technology, Hoboken, N. J., succeeding the late Henry Morton.

H. A. SHIPMAN, late superintendent

Stratton's Independence Co., Cripple Creek, Colo., is to proceed immediately to London.

S. Z. MITCHELL, general manager Tacoma Ry. & Power Co., Tacoma, Wash., is succeeded by W. L. Dimmock of Richmond, Va.

GEO. H. LEWIS, general manager Crystal Water Co., Tonopah, Nev., is in San Francisco to get supplies for Tonopah's water system.

DR. SIMONDS of Simonds & Wainwright, mining engineers of New York, is examining gold mining property in San Luis Obispo county, Cal.

A. J. HUGHES of the Hughes Iron & Steel Works, Hughesofka, Southern Russia, is taking observations of American manufacturing methods.

PROF. A. VANDER NAILLEN, president of the School of Engineering of San Francisco, returned on the 19th inst. after an absence of five months abroad.

T. H. TRACY is enlarging the smelter plant and the new electric light plant to be built by the North American Copper Co. at Grand Encampment, Wyo.

THOS. WALSH of Colorado is back from Europe. He proposes to form a syndicate in the interest of King Leopold of Belgium to develop the mines in the Congo Free State, Africa.

W. C. GREENE, president Cananea Copper Co., is going to New York to attend a meeting of the stockholders, and says the company is turning out 4,000,000 pounds of copper every month.

J. MACGINNISS, vice-president of Montana Ore Purchasing Co., has returned from New York City to Butte, Mont. While East he engineered the organization of the United Copper Co.

GEO. W. MYERS, Pacific coast agent Chrome Steel Works, Brooklyn, N. Y., and the Masurite Explosive Co., New York City, has returned to San Francisco from a business visit to Tuolumne county, Cal.

T. J. GRIER, superintendent Homestake M. Co. of South Dakota, has been visiting the Treadwell mine, Douglas Island, Alaska. It is rumored in Deadwood that his visit was in behalf of J. B. Haggin, one of the controlling stockholders of the Homestake, who is locally reported to contemplate the purchase of the Treadwell.

Commercial Paragraphs.

A CONTRACT has been let to the Joshua Hendy Machine Works of San Francisco to erect a 20-stamp mill for the Red Cross mine, Washington, Nevada county, Cal.

THE Ogden Assay Co., who for many years have been located at 1429 Sixteenth street, Denver, Colo., have removed to more convenient and centrally located quarters at 1725 Arapahoe street, Denver, Colo.

THE Western Electric Drill Co., Butte, Montana, report the sale of two Durkee electric drills, including boiler, engine, generator, etc., complete to W. E. Sanders, Bonanza group of mines, Wisdom, Mont.

FAIRBANKS, MORSE & CO., through their manager at Salt Lake City, Mr. C. P. Mason, report the sale of a thirty-four H. P. gasoline hoisting engine for Tonopah, Nev., including a large bill of mining supplies, being a complete equipment.

THE California Electrical Works of San Francisco handle the new type Sunbeam lamp, which they consider more satisfactory than many lamps now on the market. They carry a good stock in San Francisco and expect to be in a position to make prompt shipments at all times. They say: "The Sunbeam lamp will maintain its initial candle power beyond the time when most others will fail, and this is the period when the real quality of a lamp is demonstrated."

THE Holthoff Machinery Co., of Cudahy, Milwaukee, Wis., gives a statement of large orders taken by them as follows: Dos Estrellas M. Co., Mexico, complete cyanide plant; Johnny G. M. Co., Salt Lake City, Utah, 10-stamp mill, complete with power; Silverton M. Co., Silverton, Colo., miscellaneous equipment, including power, for stamp mill; U. S. Reduction & Refining Co., Colorado City, Colo., roll shells; Buena Vista M. Co., Mexico, roll shells; Inguaran G. M. Co., Mexico, 6200 feet of pipe line; Milwaukee Gaslight Co., Milwaukee, Wis., ten large condensers and four large internal fire boilers; State Board of Control, Madison, Wis., internal furnace boiler for Waupun State Prison; Magnus Metal Co., Chicago, Ill., 150 H. P. internal fire boiler.

THE Eureka Fire Hose Co., of Jersey City, N. J., have decided to discard their present direct-current power transmission system and to adopt an alternating current system in order to reduce the cost of fire insurance where motors are used in

the presence of inflammable material. This step has been taken on the advice of one of the largest insurance companies of this country. The new apparatus includes one 75 K. W., belt-driven alternator, furnishing two-phase current at 7200 alternations and 220 volts; also exciter, switchboard equipment, slide rails, rheostats, etc. A number of induction motors have been purchased, including the following: five of 15 H. P., one of 10 H. P., five of 5 H. P. and three of 2 H. P. With these there will be furnished a switchboard feeder panel, completely equipped with instruments and switches. The entire electrical equipment has been ordered from the Westinghouse Electric & Manufacturing Co.

Books Received.

Some time ago this paper said editorially that mining and metallurgy, electrochemistry and scientific progress along these lines moved at so rapid a rate that books on those subjects were often antedated and behind time when issued from the press, and that it was largely to the current issues of the trade journals and technical press that seekers after advancement should look.

If there were any exception to be made to that assertion it would certainly be in such an instance as that of the four sumptuous volumes received this week, with the compliments of the local representative of the International Text-book Co. of Scranton, Pa. The title of the series is, "Metallurgy of Gold, Silver, Copper and Zinc." One of the four treats on hypophosphite chlorination, copper, lead, zinc, electro-metallurgy; another on milling, sampling, roasting, cyanide process; a third on engines, boilers, chemistry, assaying; the fourth on mathematics, mechanics and hydraulics. They are text-books, simple and elementary in some ways, with questions and answers, slightly after the fashion of school books, but with a wealth of detail and a simplicity of explanation that gives them real value. It is within bounds to say that there is something of interest and value to be found in these admirable volumes to any student or practitioner in the departments of applied science of which they treat. Not the least in point of merit is the full index in each volume. The work, as a whole, is designed for use by the International Correspondence School.

Catalogues Received.

7x10 inches, about 900 pages, quarto, half morocco, a big thing every way, is the massive and mammoth volume sent by the Mine & Smelter Supply Co. of Denver, Colo. It seems ridiculous to class such a volume as a "catalogue." It represents a tremendous lot of clever and expensive work. Were some one to write the history of such a catalogue from its first start in the brain of some man in the machinery department to its final completion it would be an interesting story. This is "Catalogue No. 15." The number of the copy sent to this paper is 873. Next to the volume sent out by Manning, Maxwell & Moore, it is the biggest thing in the machinery catalogue line received in this office this year. The man who got it up—A. M. Candee—deserves special notice, and the enterprising concern that issues it deserves special mention. The work is in ten sections; it takes in about everything that a miner or machinery worker uses in the way of appliances, in the line of the Mine & Smelter Supply Co., is superbly illustrated, sumptuously printed on heavy plate paper and weighs seven pounds and ten ounces. Ordinarily it is said, "A copy will be sent to any address," but the writer hesitates to make the usual assertion in this case. The postage on each copy is 57 cents, and the cost of each must be considerable. Still, our readers might try asking for a copy and see what the result is.

Obituary.

MAJOR J. W. POWELL, director of the Bureau of Ethnology at the Smithsonian Institution at Washington, died at Haven, Me., on the 23rd inst. He had been connected with the scientific work of the Government since 1861. His most notable work was his exploration of the Grand Canyon of the Colorado. He was the first man who went through the Colorado canyon its entire length from Green River station to the mouth of the canyon. Major Powell's work as director of the Government geographical surveys in the Rocky mountain region in the early seventies was of value. This Rocky mountain district was one of the four surveys of the Territories which in 1879, were combined into the present geographical survey. He had been director of the geographical survey for more than a decade, beginning in 1880.

Latest Market Reports.

SAN FRANCISCO, Sept. 26, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 51½c, refined (1000 fine); San Francisco, 51½c; Mexican dollars, 43½c San Francisco, 40½ New York.

Seligman & Co., New York, say they will receive \$1,250,000 gold from Australia. The gold is due at San Francisco on October 6th. The South African gold consignment will amount to \$3,500,000.

Ladenburg, Thalmann & Co. say that \$500,000 gold has been consigned to them from Australia. It is due in San Francisco the latter part of October.

COPPER.—New York: Standard, \$10.75@11.25; Lake, 1 to 3 casks, \$11.75; carload lots, \$11.25; Electrolytic, 1 to 3 casks, \$11.50; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.50; carload lots, \$11.25. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £52 13s 9d spot per ton.

According to the figures of Secretary Stanton of the Copper Producers' Association, the domestic production of copper for August, 1902, was the smallest since April and amounted to 25,296 tons, against 26,749 tons in July and 26,740 tons in June, but was about 4000 tons larger than in August, 1901. The exports in August, 1902, amounted to 12,429 tons, against 11,733 tons in July.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 17s 6d per ton.

SPELTER.—New York, \$5.50; St. Louis, \$4.50; London, £19 per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$25.80; San Francisco, ton lots, 29c; 1000 lbs., 29c; 500 lbs., 29c; 200 lbs., 29½c; less, 30c; bar tin, \$3.35. London, £118 12s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 per flask of 7½ lbs.; Denver, \$49.65. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipsé, 37½c.

ALUMINUM.—New York, No. 1, 90% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 19.50c; San Francisco, Plumbers', 100-lb. lots, 16c.

NICKEL.—New York, 50@60c per lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.50; gray forge, \$20.50; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31 and \$31.50; open hearth billets, \$33 and \$33.50; San Francisco, bar, 7c to 12c per lb.

CHICAGO CURRENT QUOTATIONS.

CEMENT.—Germania, \$2.45; K. B. & S., \$2.80; Hewmoor, \$2.75; Trowell, \$2.75; Portland, \$3.00 per bbl.

LIME.—Santa Cruz, \$2.00; Roche Harbor, \$2.00 per bbl.

LUMBER.—(Retail): Pine, ordinary

sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; lath, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.30; Cut, \$3.30; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c per set; 14 oz., 40s., 9½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$7.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$13.00; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c per lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66½ B, 2c per lb.; soda ash, \$2.00 per 100 lbs.; hypophosphite of soda, 24@30c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3½@3¾c; California refined, 2@2½c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.25 @1.50 per 100 lbs.; sks, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c per lb.

OILS.—Lined, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 50c; cs, 55c; raw, bbl., 48c; cs, 53c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs, 25c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., 95c; cs., \$1.05; Neats-foot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, 4c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c per lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, per lb., 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) per lb., \$1.25.

MERCURY.—Bichloride, per lb., 90c.

MOLYBDENUM.—25c. per gramme; 1000 grammes=2½ lbs.

PHOSPHORUS.—(American) per lb., 80c.

SILVER.—Chloride, per oz., 75c; nitrate, 55c.

SODIUM.—Metal, per lb., \$1.00.

URANIUM.—Oxide, per lb., \$3.50.

ZINC.—Metallic, chemically pure, per lb., 50c.

ZINC.—Dust, per lb., 10c.

ZINC.—Sulphate, per lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELEVATOR.—No. 708,755. Sept. 9, 1902. M. A. Clelland, San Francisco, Cal. Assignor to Cahill & Hall Elevator Co., of same place. This invention relates to improvements in elevators for buildings and like uses, and consists of a mechanism by which an elevator cage may be raised or lowered, and a suitable well or guideway; means by which said movable portion may be raised from any point at which it may be standing, and moved in either direction up or down to any other stated point where it may be desired to have the movable part stop. The mechanism enables the cage to be operated from any floor or station independent of the station at which the cage may be standing and by which mechanism the cage will be started from its position and caused to move either upward or downward, and an automatic mechanism by which the cage or movable part may be stopped at any other desired station without further attention.

MACHINE FOR PERFORATING PIPES.—No. 708,763. Sept. 9, 1902. E. R. Graham, Bakersfield, Cal. This invention is designed to perforate pipes, such as the casings of oil, gas and like wells, where it is desirable to perforate the casing at points above the bottom of the well, in order to let in the surrounding fluid which may afterwards be removed by pumps. It consists of a series of radially disposed punches or knives, a spreader or mandrel by which the punches are driven out-

wardly against and through the casing, and means for suspending the parts at any desired point in the well, together with means for retracting the punches and mandrel.

KILN BURNING APPARATUS.—No. 708,707. Sept. 9, 1902. G. F. and H. N. Gray and R. South, San Francisco, Cal. This invention is designed to provide a more effectual means for applying heat in burning brick, pottery and similar wares within the kiln. It consists in the arrangement of drip burners or supply pipes, passages through which fuel oil may be delivered into the desired portions of the kiln from above and the discharge regulated, and supply pipes through which the oil is conducted to the burners so that the chambers where the burning takes place may have the temperature gradually raised to first expel the moisture and drive it off and finally to complete the burning or baking.

DEVICE FOR THE MANUFACTURE OF PHOTOGRAPHIC CARD MOUNTS.—No. 708,675. Sept. 9, 1902. P. J. Stuparich, San Francisco, Cal. This invention is designed for manufacturing ornamental photographic card mounts in a single operation, and consists of a punch and die by which the center of the card is punched out to form an opening for the reception of the picture, and a supplemental annular die fitting around the shank of the punch having its face adapted to form an ornamental border around the opening simultaneously with the formation of the opening itself.

BOX FASTENING.—No. 708,702. Sept. 9, 1902. E. Fletcher, San Francisco, Cal. Assigned to Nailless Lid Box Co., San Francisco, Cal. This device is designed to removably secure box sections together without the use of nails. It consists in forming the covers with transverse grooves on the top near each end, in which grooves the separating strips may be placed, and in combination with these wires fit into grooves or channels in the covers or in the strips, and extending diagonally outward and downward, the ends are bent so as to be inserted into the sides of the box. The opposite side of the wires serves to lock the parts in place and they are removable by simply detaching the ends from the sides of the box.

SAFETY ATTACHMENT FOR HYDRAULIC NOZZLES.—No. 708,693. Sept. 9, 1902. P. Bouery, Weaverville, Cal. This invention is designed to provide a safety attachment in connection with the pivoted or swivel joints of nozzles which are employed to direct heavy streams of water as in the case of the hydraulic washing of gold-bearing earth and the like. The nozzle is turnable on trunnions on the pipe section. Arms are secured to the nozzle, turnable therewith, and segmental flanges are arranged on the pipe section so that the arms will engage with the flanges.

PACKAGE.—No. 708,696. Sept. 9, 1902. E. H. Davis, Mesa Grande, Cal. Assignor to Nailless Lid Box Co., San Francisco, Cal. The object of this invention is to provide a package for the

transportation especially of small fruits, raisins and like commodities which are to be displayed when the package is opened. The box or receptacle has a loose lid having transverse grooves across the top, half of a length sufficient to extend continuously across the top and be seated in the grooves. These half grooves embrace the sides of the receptacle and are arranged in a slanting manner having spurs at the terminals which may be driven into the sides of the box and thus hold the lid in place.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING SEPT. 16, 1902

- 709,451.—BAO MAKING MACHINE—J. F. Ames, Portland, Or.
 709,191.—ROCK DRILL—R. Avery, S. F.
 709,135.—ORE LEACHING MACHINE—J. Brown, Tonopah, Nev.
 709,300.—FENCE POST—J. Buchtel, Portland, Or.
 709,590.—STEAM TRAP—J. Campbell, Port Blakely, Wash.
 709,301.—MACHINE GUN—E. M. Capps, San Diego, Cal.
 709,207.—ANIMAL EXTERMINATOR—L. N. Cornett, Nativiland, Cal.
 709,210.—TUMP WAGON—J. J. Eagen, Oakland, Cal.
 709,211.—PUMP—R. W. Elliott, Oakley, Cal.
 709,487.—STOVE PIPE HOLDER—J. E. Faulkner, Watertown, Wash.
 709,400.—ROD COUPLING—J. T. Fitzpatrick, Bakersfield, Cal.
 709,405.—WINDOW SCREEN—E. Hipolito, Los Angeles, Cal.
 709,153.—GATE—J. J. Hynding, Ferndale, Cal.
 709,321.—WOOD WASHING MACHINE—J. Keefe, S. F.
 709,333.—BED AND COFFIN—L. Krage, S. F.
 709,099.—BOTTLE—W. G. Lawrence, Oakland, Cal.
 709,338.—CAR COUPLING—W. S. Lennen, Tucson, Ariz.
 709,102.—WATER GATE—Martin & Ormand, Riverside, Cal.
 709,103.—MASSAGE MACHINE—C. E. Mason, S. F.
 709,104.—STAMP MILL MORTAR—W. A. Merralls, S. F.
 709,341.—GAS GENERATOR—C. W. Metcalf, Tucson, Ariz.
 709,236.—STATION INDICATOR—C. E. Morgan, Portland, Or.
 709,028.—PLOW—J. P. Mulroney, Plaza, Wash.
 709,370.—OIL BURNER—E. Stewart, Los Angeles, Cal.
 709,443.—OIL BURNER—W. H. Stewart, San Jose, Cal.
 709,248.—ELEVATING MACHINE—A. P. Tatterson, Stockton, Cal.
 709,428.—EXPLOSIVE ENGINE—F. B. Warring, San Jose, Cal.

SITUATIONS WANTED.

PHYSICIAN desires position with mining company. Good experience in hospital and general practice. Speaks German, Scandinavian, some French and Spanish. Anxious for advancement, but has no means. Address "Physician," care of this office, or 1327 S. Grand Ave., Los Angeles.

Cyanide Chemist, at present superintendent of cyanide mill, will be open for engagement after the 15th of October. Has been assayer of custom mill and mint. Ten years' practical experience of gold metallurgy in different countries. Address A. B. C., care Mining and Scientific Press, 606 Mack Block, Denver, Colo.

Have had eight years' experience as chief chemist and assayer for large copper smelting company; since then have been in charge of mines and smelting operations. Would like a position with some good, reliable company; can give the best of references. Address E. M. C., this office.

Cyanide and Stamp Mill Superintendent or Assistant Manager open for engagement after September 1st. Graduate. A thorough assayer and chemist; also accountant. Speaks Spanish. Will go anywhere. Specialty, construction; also successful treatment of low-grade and slimy ores. References "A. I." Address Practical, this office.

ASSAYER wishes to change position. Is also experienced amalgamator and miner. Would like to take charge of small plant. Speaks Spanish. "Aleman," Mining and Scientific Press.

Wanted, position by a first-class amalgamator and millman; also mining engineer and understands assaying; has had 15 years' practical experience in mining and milling; understands the erecting of milling machinery; best of references exchanged. Willing to go to any part of the country. Address Amalgamator, this office.

GOLD DREDGING.—Mining engineer with 8 years' practical experience in gold dredging is open for an engagement. X. Y. Z., care Mining and Scientific Press.

COMPETENT SUPERINTENDENT wants position in California; 15 years' experience in running mines, mills and smelters for profit, and managing men. College bred and technically educated. Formerly held positions as assayer, mining engineer, accountant, superintendent, and manager. Member A. I. M. E. High testimonials. Address "Superintendent," Box 813, Seattle, Wash.

WANTED.

Position as superintendent or assayer. Have had experience in mining, milling, cyaniding, smelting and putting up machinery and operating the above. Have a good assay outfit. Can sharpen tools. J. L. Wetmore, 1223 S. San Joaquin St., Stockton, Cal.

Value in Mining Literature.

The article on page 191 by an experienced Colorado miner on shaft sinking is the kind of thing that this paper takes particular pleasure in publishing, because it is just the sort of practical information of immediate value to any miner; it is useful, is what can not be found in any text-book or book of reference, and is what a good many want to know. It is illustrative of one phase of mining and scientific literature that appeals to all of us, viz., that while it is always easy to get descriptions of things, yet it is not always so easy to get clearly written accounts of

of knowledge there is a mutual advance, for "everybody is wiser than anybody," and sometimes the veteran can get a pointer from the tyro. Not the least of value in such an article is the immediate value to the man himself in writing it. For no matter how well a man may know the details of a subject, whether it be sinking a shaft, or constructing a ditch, or building a mill, or running a tunnel, yet, when he starts to write an article telling just how he did it, nine times out of ten he finds that he must marshal his facts and figures; must get data and set things down exact, and in the exactness lies the greatest measure of value to himself, and thus such

An occurrence unique in alleged cause is reported from a Portland, Or., machine shop, where three men were heating a small piston to shrink it onto a rod. While doing so it "exploded" with fatal result. Local accounts favor the theory that water seeped through 2 inches of solid cast iron, which under heat made steam pressure sufficient to rend the iron. The piston was 12 inches diameter and 12 inches long, the rod to fit through the center hole. It was an old piston and had been heated before. While it is locally asserted that there was no crack or fracture and no way for water to get in to be converted into steam, except by "absorption," such a

Hidden Treasure Vein No. 1, 600-Foot Level, Looking North, Portland Gold Mining Co., Cripple Creek District, Colorado. (See Page 187.)

how things are done, and it is just this latter that most interests the worker. There is always, of course, a certain amount of interest attached to illustrated accounts of big things, of great enterprises, but the reader, whether he be miner, millman, shift boss, or general manager, would be considerably more interested in the solution of some one of the little everyday problems that bother him in his work. That is why this paper so often urges miners and metallurgists to give of their store of experience, to give others the benefit of their knowledge and observation. There was a time that they didn't know and were glad to learn, and now that they have mastered many of the little details once so bothersome their light would be none the less for having lit that of their neighbors'.

The articles that tell how to do things, when written by the men who do them, are great help and of considerable encouragement to others not so experienced, and it often happens that in this interchange

an article is of value to him who writes it, as well as to those who read it.

The presentation and solution of ever-present problems that arise in daily work has long been our province and our privilege, and nothing is more welcome in the office of such a journal as this than a plain, clear story of how a thing is done, written by the man who has done it. He, probably, has done it so often and so well that it may appear trite, and even trivial, but its description may be as an inspiration to many others who long for just such information, and who are ready to respond with presentation of something else in which they have achieved a modest degree of success. There is a great deal of technical matter published, but that which is best and deserving of being preserved is what tells how things are done in the line of daily work, the "little" things as well as the big ones, for in this business, as in all others, it is trifles that make up perfection; and yet perfection is no trifle.

theory is not tenable, as only under inconceivable pressure could the most minute quantity of water permeate the pores of cast iron. It is more likely that when that piston was cast there was a minute flaw in the casting into which under pressure water percolated, oxidation closing the egress of steam upon heating, with disastrous result. The lesson is not to consider such an event as an "accident," for there is nothing accidental about it, but in such cases to make sure by drilling, if necessary, that no such predisposing cause for explosion exists.

It is a trite illustration to note metallurgical progress, but a notable case in point is afforded in Leadville, Colo., zinc ores. Formerly an ore in that locality had to carry 45% zinc before any of the plants would attempt treatment. There is now a good demand from there for ore carrying 30% zinc. Considerable such ore is now being shipped to zinc reduction works in Colorado, Kansas and Belgium.

Personal; Commercial Paragraphs; Catalogues Received, 198. New Patents; Notices of Recent Patents, 199.

REGARDING the recent editorial remarks in connection with the morally fraudulent grabbing of mineral lands under the timber act of 1878, it is to be further specially noted that each such applicant for the purchase of such land must make oath that the land is chiefly valuable for the timber thereon. If it can be shown that the applicant swore falsely the Government of the United States can set aside the patent if issued, and restore the land to the public domain, to be again open to mineral location in accordance with the Statute of 1872.

THE notable success technically and commercially of high-voltage long-distance electrical power transmission on the Pacific coast has created the impression in some quarters that such power transmission is limitless. But there are indications that the latest California achievement in this direction is close to the limit. Ten years ago the transmission of 20,000 volts 100 miles was deemed an impossible idea. The Bay Counties Power Co. is now successfully transmitting 40,000 volts 182 miles. Recent experience appears to indicate that beyond 60,000 volts the resisting power of the air begins to break down and that atmospheric conduction and leakage ensue. The price of conducting material is another limiting factor in long-distance transmission. Insulation is the furthest advanced and the least liable to limitation. The most important part of it all is the matter of profit, for at the point at which such transmission ceases to be reasonably profitable marks the limit of such expansion as has been so remarkable a local feature of electric engineering in the last six years.

ELECTRO-METALLURGY AND ELECTRO-CHEMICAL research are so important a factor in mining and scientific progress that a national society is now in process of formation based on the same general lines as the American Institute of Electrical Engineers. The new move originated in Philadelphia, and so far about 400 have been interested in membership. It is characteristic that as soon as any branch of progressive work assumes a certain place and dignity in the scientific world that its practitioners associate themselves in voluntary organization for the common good. This is a distinct organization from the American Electro-Chemical Society, a new organization that is attracting to itself some of the brightest minds in that branch of mining and scientific progress. This society held its second meeting at Niagara Falls, N. Y., on September 15-18, with an

attendance of about 200. The society now has 418 members. Several technical papers were read and discussed, one on the closed, continuous type of electric furnace being deemed worthy of editorial mention. The author, E. R. Taylor of Penn Yan, N. Y., produced designs of an electric furnace of that type, being the result of practical and successful experience. It is intended for the manufacture of carbon bisulphide by the combination of carbon and sulphur at high temperature. A detailed technical description of the furnace would not be interesting to a majority of our readers, but the notable statement was made by the author that with less nerve on his part and less actual risk of failure than it required to build the furnace he was describing, he could construct a continuous electric furnace "that would dwarf the largest blast furnace in existence." His present furnaces are 16x40 feet.

A DILLON, MONTANA, concern advertises that its shareholders are to be assessed so much or so little per share to supply funds to develop a mining property on which an option is held. The company tacitly admits it owns no mining property or any other kind of property, but claims possession of value in the option and that it is right in assessing its stockholders for money to demonstrate just how much that option may be worth. While the thing cannot be commended as wholly regular, yet it seems to us that it is not fair to condemn it. There is something in the idea. If the company means business and honestly intends to develop the property on which it has an option and thus determine if it be worth buying; if it proposes to employ labor and pay its bills and do some mining in miners' fashion, it may in a measure justly ask its stockholders to pay assessments for such purposes. Still the corporation should be perfectly frank with its stockholders, tell them the exact facts; have them precisely understand that after they have paid their money they really own nothing tangible. In that way the company can avoid being afterwards charged with having obtained money under false pretenses.

AMERICAN manufacturers of patented articles can protect themselves against importations of infringements of such articles without taking the matter into court. Section 11 of the tariff act provides: "That no article of imported merchandise which shall copy or simulate the name or trade-mark of any domestic manufacture or manufacturer, or which shall bear a name or mark which is calculated to lead the public to believe that the article is manufactured in the United States, shall be admitted to entry at any Custom House of the United States. And in order to aid the officers of the Custom House in enforcing this prohibition, any domestic manufacturer who has adopted trade-marks may require his name and residence and a description of his trade-marks to be recorded in books which shall be kept for that purpose in the Department of the Treasury, under such regulations as the Secretary of the Treasury may prescribe, and may furnish to the Department facsimiles of such trade-marks; and thereupon the Secretary of the Treasury shall cause one or more copies of the same to be transmitted to each collector or other proper officer of the customs."

RECENTLY was noted herein as a passing fancy the midsummer dream of dwellers on the Hassayampa, Ariz., who proposed a mammoth cyaniding scheme, where the ordinary tank or vat would be ignored, as too trifling for contemplation, and the whole bed of the Hassayampa devoted to tank purposes by the emptying therein of six or eight carloads of potassium cyanide, after which nature would be left to take its course. As no glittering advertisement of the millions so easily made has so far been noted in Eastern papers, the scheme may not have materialized. But Baker City, Or., has evolved a plan formulating a \$10,000,000 company to cyanide the sands of the Snake. It seems, however satisfactory dredging and the homely burlap may be, the process of thus amassing wealth is too slow, and from advance prospectuses it is learned that great store of gold can be won by building "a gigantic dam, where all, or nearly all, of the water in the river may be taken out of the stream, cyanide added and again be sent on its journey over the gold-bearing bars in its bed. At a

proper point below the point of diversion another dam will be built to bedrock and the treasure-laden waters run through pipes to a level tract below, where they will be made to give up their treasures by means of the ordinary zinc precipitation tanks. The scheme is one of the most stupendous ever conceived, as tanks of requisite capacity would cover hundreds of acres of land, and the dams would necessarily be tremendous affairs." Well, rather! But the further statement is vouchsafed that "the possibility of saving all the gold contained in the bars of the Snake river, which are estimated by competent judges to contain from 10 to 15 cents per yard in infinitesimally small particles, makes the first cost of the plant pale into insignificance. It is estimated that the first year's run will net from \$35,000,000 to \$50,000,000." The most noticeable thing about these airy visions is that men who keep on saying such things get to believing them themselves after a while.

Mistakes Not Irrevocable.

A Colorado correspondent dissents from a statement or expression of opinion that appeared in the issue of the 23rd ult., in which was stated editorially that: "A mining engineer who has made a big mistake somehow, sometime, somewhere, and who has cost some company a big lot of money, is not always a man to shun in selecting competent mine management. It simply means that someone else has paid for his experience and it is not always likely that he will repeat the extensive and expensive mistake."

He thinks that a mining engineer who has made a big mistake should not receive any further countenance from any big employer; that the fact that he has made a mistake will predispose him to make other mistakes, and, accordingly, that he is of no further account to anybody, including himself. This is kind of hard. We are all liable to make mistakes, for infallibility is something denied to all mortals. Indeed, the writer believes that the man who never made a mistake never did anything else, good or bad, and that it is by our mistakes that some of the best things in this life are founded, namely, in being able to avoid them, in having the lesson so firmly impressed in one's mind that it will make him more cautious and less liable to a similar error of judgment. Defeat is part of our education, and one sometimes gains as much from a defeat as from a victory.

It is believed that our correspondent takes too hard a view and sets too lofty a standard for anyone, including himself. Any argument is worth just what it amounts to, when run to its logical conclusion, and if our correspondent's conclusions are correct it would close out all progress, all effort, and all possibility of advance in any line of human thought or action. It would shut the gates of hope and mercy, and set us all back away behind where we were in the stone age.

The idea implies, in general, that a mining engineer accepting a good salary, in a good position, ought to know it all, which appears absurd. No man knows it all, and when he takes a position, whatever he be paid, he cannot be paid for what he does not know, for if he or anyone else anywhere were paid for what he does not know there would not be money enough in the universe to pay any one man any salary in any position. What he is paid for is what he does know, and what he does know is subject to a great many contingent circumstances, and has to be tested by conditions as they arise, conditions often found new and perplexing.

This is not intended, nor is it to be interpreted, as an excuse, apology, or palliation of incompetence, but merely to illustrate the fact (for it is a fact) that most of us learn by either observation or experience. Fortunate, indeed, is the man who can learn wholly by observation alone—who can note and avoid the mistakes of others without making a mistake himself; but still it is probably the fact in nearly every case that the lessons one learns by experience are vastly more valuable to him than anything he can possibly learn by mere observance of others' shortcomings. The whole thing is a question of ethics, that need hardly be entered into at length, the idea of the paragraph which elicited our correspondent's dissent being one that has been almost universally accepted in every line of work since work began, and as true as trite.

Concentrates.

THE freight on mining machinery from Chicago, Ill., to Baker City, Or., is \$1.32 per 100 pounds.

THE output of silver in the United States for the year ending June 30, 1902, was, approximately, 64,000,000 ounces.

CALCIUM CARBIDE costs \$3.75 per 100 pounds, or \$70 per ton in ton lots at distributing points east of the Missouri river.

IN the Mercur district, Utah, at the Chloride Point mine, gold has been produced at a cost of \$8 per ounce and silver at a cost of 23 cents per ounce.

SINCE 1853 \$1000 coined in standard silver dollars minted at the U. S. mint weigh 859.375 ounces, and the same amount in halves, quarters and dimes, 803.75 ounces.

OF equal weights, wood has two-fifths the evaporative power of coal in making steam—it will do less than one-half coal's work. Oil is more economical than either under general conditions.

IRON may be quickly and easily cleaned of rust by dipping in or washing with nitric acid, one part; muriatic acid, one part; water, twelve parts. After using, wash with clean water.

THE Land Department considers each individual placer location a separate mining claim in application for a U. S. patent, and upon each is required \$500 in work or improvements. One application will do for contiguous or adjoining claims.

AS to selective action in the cyanide process when copper is present, cyanide of potassium has an affinity for the copper, not for the gold; in case of excess of the solvent, the excess will operate against the base metals and be quiescent as to the gold.

THE magnetic poles are the points to which the magnetic meridians, as determined by the directions of the compass needle, converge. The one in the northern hemisphere is located 70.5° N., 97° W. The south magnetic pole has never been reached, but is believed to be not far from 73° S., 150° E.

WHEN the right to a patent to a mining claim has been fully acquired the equitable title in the purchase is complete and there is no obligation to make further expenditure in labor or improvements on the claim under Sec. 2324 of the Revised Statutes, and no adverse interest can thereafter be acquired by re-location or otherwise.

ZINC PRODUCTION is growing at a faster rate than copper production. The 1891 zinc production of the world was 404,320 tons; of 1901, 582,400 tons. The American production was 87,360 and 179,200 tons, respectively. The world is beginning to depend on the United States for zinc. Last year this country exported 23,000 tons of zinc.

POTASSIUM PERMANGANATE can be used in treating gold-copper ores. The finely crushed ore is ground with chloride of sodium and sulphuric acid and the permanganate added to the mixture. Hydrochloric acid is formed at first, which with the permanganate yields chlorine, which at the moment of its liberation dissolves the gold.

A GOOD cement for leather beiting is made by working together ten parts of bisulphide of carbon, one part oil of turpentine with gutta percha, forming a thick paste. The leather where the cement is to go should be unrolled and roughed, and when the cement is put on the ends should be pressed together closely till the cement has well dried.

THE failure of any applicant for the patent to a mining claim to prosecute his application to completion, by filing the necessary proofs and making payment for the land, within a reasonable time after the expiration of the period of publication of notice of the application, or after the termination of adverse proceedings in courts, constitutes a waiver by the applicant of all rights obtained by the earlier proceedings upon the application.

THE annual expenditure of \$100 in labor or improvements on a mining claim, required by Sec. 2324 of the Revised Statutes, is solely a matter between rival or adverse claimants to the same mineral land, and goes only to the right of possession, the determination of which is committed exclusively to the courts. It is a matter with which the land department has nothing to do, and hence can make no determination with respect to it.

MOLYBDENITE, the ore from which molybdenum is produced, is a soft, scaly, foliated mineral of glossy lead color, and is the sulphide form in which molybdenum occurs. It is largely distributed through granite, gneiss and limestone formations. In appearance the metal has a silvery look, somewhat resembling high-grade graphite, but from which it can be distinguished by its streak. Its existence in surface veins is indicated by the brilliant saffron color of the oxidized metal.

FOR $\frac{3}{4}$ in. and $\frac{1}{2}$ in. rivets, pressures of 60 to 70 tons are required on the rivets, the work done being about 7200-foot pounds for $\frac{3}{4}$ in. rivets and 9500-foot pounds for $\frac{1}{2}$ in. rivets. These figures refer to bridge work; in boiler work, where rivets are shorter and the holes usually better finished, less power is needed and the pressures required are about as follows: For $\frac{3}{8}$ in. rivets, 25 tons; for 1 in. rivets, 66 tons; and for $1\frac{1}{4}$ in. rivets, 100 tons. For cold flanging of $\frac{1}{2}$ in. steel plates a pressure of 600 pounds to 740 pounds is needed per running inch, with 5-16 in.

plates, 710 pounds to 750 pounds pressure per running inch for $\frac{1}{2}$ in. plates, and 380 pounds for $\frac{1}{4}$ in. plates, though much will depend upon the heat of the plate. For cold riveting, pressures of 300,000 pounds per square inch are needed.

THE reason why mercury is used in thermometers is because of all liquids it most nearly fills the conditions of returning accurately to the same volume upon being brought to its initial temperature, and of admitting a considerable change of temperature without a change of state. Moreover, it is easily obtained, is very opaque, and hence easily seen, and does not cling to the glass. Alcohol and ether are occasionally employed for moderate and for low temperatures where mercury freezes.

FINELY powdered graphite, when introduced into the cylinders of either steam or gas automobiles, assists the oil which is usually employed for the purpose of lubrication. Vegetable or animal oil should be used sparingly, if at all, for the lubrication of engine cylinders. Even the best mineral oil in the cylinders of gas engines chars under very high heat, due to the combustion of gases. The heat in a gas engine cylinder is from 1200° to 2000° F. Special graphite lubricants are prepared for the gears of both electric, steam and gas motors.

THE Idaho grubstake law provides that "written contracts relating to prospecting or mining or to the formation of copartnership for that purpose, when signed by the parties thereto and indorsed by at least one witness, may be recorded in the office of the county recorder of the county wherein it is proposed to prosecute the business of said copartnership or where the property affected by such contract is situated. Such record shall be constructive notice to all persons of the matters contained in such contract or copartnership agreement."

THE value of chrome ore depends upon its percentage of chromic oxide, Cr_2O_3 . The standard ore contains 50% of Cr_2O_3 , and for every unit above 50 there is an increase in value per ton of 75 cents to \$1; but below 50% there is a much greater reduction per ton. Ores that are low in silica are more valuable, and even when they are as low as 45% of Cr_2O_3 they find a ready market if they are very low in silica. Chrome ore has been produced in commercial quantities in California, Maryland and Pennsylvania, but can be imported cheaper from Turkey than it can be mined in the United States under present conditions.

IN assaying zinc precipitates by a method in which nitric acid is replaced by sulphuric acid, 1.10 A. T. of precipitate is heated with 20 c.c. conc. sulphuric acid and 60 c.c. water. This is boiled for one hour, cooled, distilled to 100 c.c., 75 c.c. mineral salt solution and 20 c.c. of lead acetate solution added, the precipitate allowed to settle for one hour, then filtered, washed and dried, care being taken to wash the precipitate into the point of the filter. The paper is burned off at a very low heat, the residue scorified until half covered over in the scorifier, then poured, and the button cupelled, thirty to forty grams of lead being used.

SUPERHEATERS are generally placed behind the boilers, in the flue leading to the chimney, although when the space is too contracted to permit of this arrangement a chamber may be constructed above the boiler. Care should be taken to permit the superheater tubes to be well drained, as otherwise water is apt to collect in the lower portion, and, in spite of the heat, it remains difficult to dislodge, since in most instances there is no provision for water circulation. The space taken up by the water diminishes the capacity of the superheater, and the water is apt to be carried over suddenly to the engines, with disastrous results.

AN application for a U. S. patent for a mining claim must be accompanied by an affidavit that \$500 worth of work or improvement has been expended thereon. Where there is a group of contiguous or adjoining claims and patents are wanted for them, if it can be satisfactorily shown that the work done on any one of them went to improve or develop the entire group, it would be admissible—provided that the affidavit shows that on such one claim the work or improvement was as many times \$500 as there are claims in the group on which patent is desired. That is, supposing the application is for four claims, then an aggregate of \$2000 in work or improvement must be shown to have been expended. The \$2000 can have been put entirely on any one of the four if it can be shown that such expenditure tended to improve or develop all four.

THE air used between the cylinders of a compound pump can be interheated by inserting an ordinary feed water heater into the suction or discharge line through which the water is pumped, the cold exhaust air passing through this heater on its way to the low pressure cylinders in the same manner as boiler feed water. Exhaust air is often several degrees below zero, and as compared with that temperature, mine water at 60° is effective as a means of heating. Under this system there is no freezing and the air consumption is cut in two. This may be carried into triple or quadruple expansion for large plants of heavy duty. A hoisting engine can be arranged for reheating very readily, but in all cases the heater must be placed as close as possible to the cylinders using the air. The heater should be carefully covered with magnesia and all hot pipe connections and cylinders using the air fully protected. The usual reheating temperature does not exceed 350°, a temperature that gives no trouble with lubrication, stuffing boxes, etc. The usual rule is not to heat to a point higher than will result in the exhaust being at mine tempera-

ture, thus in no way interfering with comfort or ventilation. The exhaust of a rock drill on a hot day may be below zero, though the air be used full stroke and without expansion; but with the air heated to a point which results in an exhaust temperature about equal to the atmosphere that 95% efficiency may be secured. With a small amount of heat the results are often six times more important than results from the same amount of fuel burned in a boiler furnace.

TO BE ABLE to calculate the value of a mining property, as one would calculate the ground to be moved on a railroad, is rarely possible. No law which can have general application exists. Every case must be judged individually, for no two cases are any nearer alike than two men. Formulae for mine examinations and estimates are pretty and read nice, but are not satisfactory in practice. Ore in sight is always an indefinite quantity when measured in net value. While tonnage may be estimated in many cases accurately, values are not so easily arrived at. There are commercial risks in mining which cannot be measured with mathematical accuracy, any more than they can in manufacturing. Labor cost may change, strikes may come, freight and smelter charges may alter; copper, silver and lead prices vary; supplies fluctuate in price; floods and fires and cares may come; and all these things are commercial risks. Then there are few ore deposits so regular that anything more than an approximate estimate can be made of their tonnage. When it comes to values, they are so changeable that what they will be out of sight is only a guess. Geographically, one may say that the chances are an ore body will continue. But no one can accurately say what its value will be.

IN the Red Jacket drift mine, Placer county, Cal., the gold is found in the channel of an obliterated river, now covered with volcanic filling to a depth of several thousand feet, but still at the top of a mountain. It is reached by a horizontal drift 1700 feet long. The drainage water is made to drive a water wheel and blower for ventilation purposes, and farther in its flow downward to drive another compressor, which furnishes the power for the operation of the mine, including an air compressor locomotive. Compressed air was adopted for the haulage system in preference to an electric traction system, owing to the irregularity of the tunnel and to the fact that there is no timbering in the mine, the volcanic roof of the tunnel being as hard and strong as cement. Consequently there were no convenient points for the attachment of insulators. The locomotive can take sixteen to eighteen empty cars into the mine at a speed of about 9 miles an hour. The loaded cars are taken out by gravity. The face of the working is over $3\frac{1}{2}$ miles from the entrance to the tunnel. This is a typical drift mine, representing in its operation the perfections, detail and economy of cost that experience in this kind of mining has suggested. Its original location was by purely theoretical deduction.

SUBSCRIBERS to a live, progressive technical journal might consider themselves a vast fraternal organization, whose business it should be to help each other. The man who learns how to do any work easier than he has been in the habit of doing it can lose nothing by describing the operation for the benefit of his brother miners or metallurgists who are subscribers, for the man who gives something of his own knowledge is sure to get back in return something of the knowledge of others, and in the long run all are benefited. The man who has read this paper for a year or longer will find his intellectual range broadened. He no longer considers himself one of a small community, but rather one of a large community, extending practically all over the world, because the readers of this paper can be found in nearly every civilized country on the globe. The miner in Oregon finds himself in touch with the miner in Australia or South Africa. There was a time, years ago, when experienced miners tried to keep their knowledge to themselves, under the impression that what they had spent years in learning ought not to be given away. In the early days of the publication of this paper this was a strong feeling in many places, but that is nearly all gone. The man who thought he knew how to do work better than anybody else discovered after a while that others knew as much as he did.

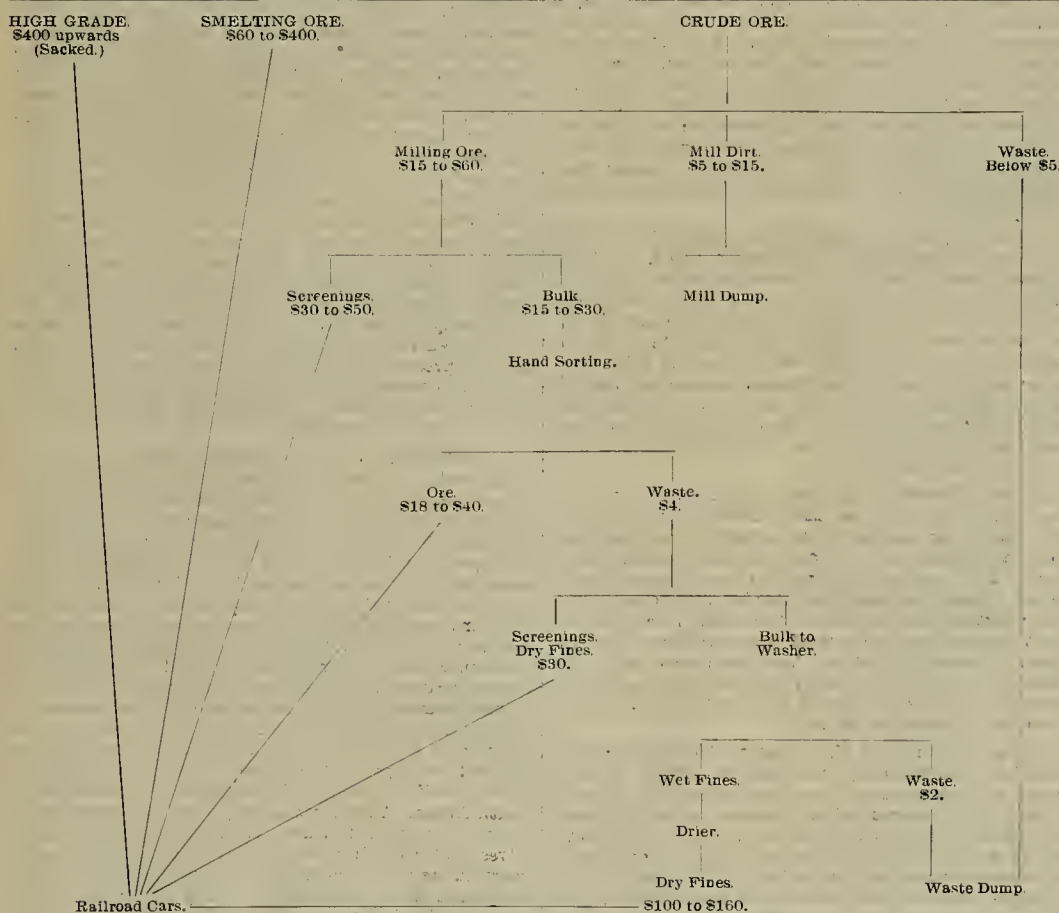

THE most recent improvements in the manufacture of sulphuric acid comprise a process used in Germany, being the substitution of cast iron recipients for concentrating the acid for those constructed of platinum. The high price of the latter metal has led the manufacturers to look for a substitute, and it has been found that the cast iron recipients answer very well in cases where it is not necessary to have an acid absolutely free from iron. The iron should be free from impurities and as hard as possible. In the process used the acid is first concentrated in lead recipients to 61° B, then introduced into the cast iron vessels, where it is further concentrated to 64°. It finally passes into two other concentrators, where it reaches 97° to 98° B. The smaller recipients last three or four months and the large concentrators from six months to one year, the loss being less than that of platinum and the cost comparatively small. Another process has been devised in England, in which the lead chambers are entirely suppressed, and nitrous vapors are used as an oxydant, the process resembling that which is now used for producing nordhausen, or fuming sulphuric acid. The process is advantageous in the production of concentrated acid directly, thus doing away with the concentrating process. It gives an acid which is pure and free from arsenic.

Timbering in a Colorado Gold Mine.

In the issue of Sept. 20 appeared an exhaustive article, with illustrations drawn to scale and especially engraved for this paper, the title being "Mine Timbering by the Square Set System at Rossland, B. C." The article was written by Bernard MacDonald, manager of the Le Roi mine, Rossland, B. C., and went into the subject in minutest detail of operation and costs, including the excavation of the ore.

In this connection it has been thought of further interest to portray the manner of timbering in a great mine in an entirely different region, and under entirely different circumstances, viz., the Portland gold mine, Cripple Creek district, Colorado. The three engravings on pages 188, 189 and 190 tell their own story, needing little of written explanation to the practical miner. The engraving on page 189 is merely given place to illustrate the fact that in this, as in other extensive mines, there are parts of the underground workings where timbering is unnecessary. At the time the flashlight photo was taken from which was engraved the picture on page 184, Hidden Treasure vein on that level—the 600—had developed an ore shoot 200 feet long, with an average width of 3½ feet. On the same vein in No. 2 shaft, on that level—the 600—as shown on page 184, was developed an ore shoot 205 feet long and 5 feet wide. Almost precisely similar ore development was made on the Captain vein on the 400-foot level, as shown on pages 188 and 190.

Regarding the handling of ore at the Portland mine, the accompanying diagram gives graphic representation of the system now in use there and the manner of handling the various products of the mine:

The diagram is self-explanatory. The crude ore as broken in mass by the large machine drills yields from the stopes in general two products, ore and waste, the waste not being absolutely valueless, but including all material that runs less than \$5 per ton. The proportion between ore and waste varies considerably in the different veins. In most of the stopes the product is ore and mill dirt—no waste.

A saving of values has been effected by passing the ore house waste from No. 2 shaft through a washing apparatus, which saves 50% of the assay values at small cost. This apparatus consists of an iron plate perforated with holes ½ inch diameter, set on an incline, on the upper surface of which numerous jets of water play in various directions. The ore house waste as dropped into a bin by the ore sorters passes over a screen, which takes out the dry fines at the daily rate of one ton of 1½-ounce ore. The hulk of the waste continues downward over the perforated plate, where the water jets wash off all the fines still adhering to the rock. This is collected and dried on a large, flat, hollow sheet iron box, heated by exhaust steam from the hoisting engine. This product yields one and one-half tons of ore running from 5 to 8 ounces per ton in every four shifts of eight hours each. The washer is only run eight hours per day—the day shift—and is tended by two men only, who were formerly fully occupied by tramping the waste

from the ore house. The water used is a small amount, circulating continually through a small boiler feed pump, run by exhaust steam from the hoisting engine. The final waste to the dump averages \$2 per ton, while the waste from the No. 2 ore house runs \$4 per ton.*

All big mines have their problems. Timbering and ore handling have been successfully settled. The question of handling the water is in a fair way to be. During 1901 there were pumped from the mine 147,912,898 gallons of water. They have had to handle 19,000,000 gallons of water in one month, but now have a pumping plant of sufficient capacity to take care of that quantity, permitting continuous ore extraction. The main working shaft is now near the 1200-foot level. The compressor plant is capable of driving fifty drills at an altitude of 10,000 feet. A tunnel 3 miles in length, jointly with the Gold Coin Co., passing through Straub mountain, under the city of Victor, entering at the 1400 level, would effectually solve the water problem. The only other problem of the company is to get rid of the excessive tax of \$53,000 per annum, imposed by the grangers of Iowa, the company being an Iowa incorporation. That, however, should be easy of avoidance or solution by dissolving the Iowa incorporation and reincorporating in some one of the other forty-four States.

Plans are now being drawn for the remodeling of the Burns shaft; among other things, is a belt conveyor for handling the ore. The ore on reaching the surface will be dumped over grizzlies, the coarse rock going through a crusher. The coarse rock coming from the crusher will be shot into a washing machine and from there falls on the belt conveyor. Ore sorters will take the ore off the conveyor; the waste rock

Wet Reduction of Copper Ores.

This method of obtaining copper is employed mainly with ores which are too low in grade to be worked profitably by roasting and smelting. It can be used under favorable circumstances with ores which contain as low as one-half of 1% to 1% of copper, and also for reducing the cupriferous slack which remains from the production of other metals. It consists in precipitating the copper from a vitriol or chloride solution by means of scrap iron or other reagent.

The solvents principally used for this purpose in Germany are diluted sulphuric and muriatic acids. As the former is largely produced by the dry process of reducing copper, sulphuric acid is usually cheapest in the neighborhood of copper mines, and hence vitriol solutions are generally used for the wet process in that country. Muriatic acid produces a chloride solution, and in the neighborhood of works which manufacture soda from common salt by the Leblanc process it is often sufficiently cheap and plentiful to be economically used for leaching copper ores and concentrates. In order to be worked by the wet process, ores should contain copper in the form of either oxides, sulphates or sulphurets, and upon all such minerals, including lasur and malachite, both these acids act with great energy. A special form of the wet process, known from its inventor as the "Dotsch method," is practiced in Spain, and to some extent in Germany with imported Rio Tinto ores, which contain copper and iron pyrites in combination with other metals and impurities. In this process the ore is leached with a chloride of iron solution, which takes up the copper, which, being immersed for a certain period, replaces the copper, leaving the iron pyrites practically intact. The copper is then precipitated from the charged solution with old iron, which, being immersed for a certain period, replaces the copper, which falls as a precipitate, and is then dried, smelted, and refined in the same manner as crude copper (Kupferstein) in the dry process. The two reactions which take place successively in leaching the ore and precipitating the copper from the solution thus obtained are stated in chemical formulas as follows:

1. $\text{CuS} + \text{Fe}_2\text{Cl}_6 = 2\text{FeCl}_2 + \text{CuCl}_2 + \text{S}$.
2. $\text{Cu}_2\text{S} + \text{Fe}_2\text{Cl}_6 = 2\text{FeCl}_2 + \text{CuCl}_2 + \text{S}$.

The tanks and other apparatus used for the wet process are made either of masonry or of wood which has been holed in asphalt pitch and then lined with lead. The leaching tanks have false or grated bottoms made of firebrick or hasalt. The leaching solution is pumped up repeatedly through lead pipes and poured over the top of the ore, whence it percolates downward through the mass, eating out at each passage more and more of the copper until at the end of eight or ten days it is saturated with metal and passes to the precipitating tank, where, after settling, the copper is released by the action of iron as above described, and the spent solution then regenerated and returned to perform the same service over again. By this process it is possible to leach out copper from ores down to one-fourth of 1% of the metal contained. Ores which contain lime cannot be worked with muriatic solution, as the acid attacks the alkali before taking up the copper. When a chloride of iron solution is used in the wet process, it may be cheaply made by dissolving 120 parts of common salt in 1000 parts of water and adding 280 parts of sulphate of iron (green vitriol). Crystals of sulphate of soda are formed, but these are removed by straining and the solution is then ready for use.

The proportion of iron required to precipitate copper from either of these solutions varies with certain peculiarities of the saturated solution itself, resulting from special characteristics of the ore under treatment. In theory 88.8 pounds of iron should be sufficient to precipitate 100 pounds of copper from a chloride solution of copper-sulphate ore. The more salts-of-iron oxide there is present in the lye—as often happens in treating ores heavily impregnated with iron—the more iron will be required to precipitate the copper, and the proportion may be as high as two to three pounds of iron for each pound of copper. The generation of these basic salts in the lye is one of the disadvantages of the wet process, since it not only increases the requirements of iron, but endangers the purity of the copper precipitate. This product is then washed to eliminate as much as possible of the salts of iron, graphite, silicic acid, antimony, arsenic and other impurities, after which it passes to the refining stage of the process.

The refining of cement copper, which is the technical name for the precipitate obtained by the foregoing wet process, is accomplished as follows:

If, after washing, the precipitate remains charged with impurities, it is smelted in a puddling furnace (Flammoeofen) into raw copper, and then purified. If it is reasonably pure after washing it goes direct to the refinery as cement copper, where it is treated in the same manner as the raw copper obtained by the usual German process of roasting and smelting.

L. DE LOBEL furnishes suggested details of a plan for a through line from Paris to New York via a tunnel under Bering straits; total length of lines, 14,670 miles, of which 6000 miles would have to be constructed. His plan is for a tunnel under the straits, distance 37 miles; two islands in the straits are utilized for air shafts and, possibly, stations.

will be permitted to remain on the belt, which rejects the waste way out on the dump. It is designed to make a saving in the cost of handling the mine product. The collar of the Burns shaft will be raised 30 feet.

*From the company's last annual report.

Tamping in Mine Blasting.

TO THE EDITOR:—Upon reading the "Concentrate" in the issue of Sept. 6 about tamping, the following suggested itself to me: To use from one-half to one stick of giant powder at tamping in mine blasting—according to liability of one blast shooting fuse out of another hole—for upper or any other kind of hole, would mean a great saving in time—wasted in tamping and looking for proper tamping by miners—to mine owners, and would decrease the number of accidents to miners, not to mention the powder headaches that would be avoided by handling powder longer than necessary. Impartial practical tests will show that the "tendency of giant" is not "down and out or down and up," but in all directions the same. If this is so, tamping for any other purpose but to hold the fuse in hole, even if as solid and compact as the rock drilled in, would be worthless in 999 out of every 1000 holes drilled in mines.

Chloride, Ariz.

C. KYLE SMITH.

Stamp Mill Construction.*

J. J. DEMING, Boise, Idaho.

The common operations or construction of a stamp mill do not necessarily involve a fine knowledge of chemical formulas or complicated mechanics. A good millwright or millman has that common sense which is the basis of all true science, and has won a knowledge of the true bedrock principles of stamp mill construction by close observation and experience, which no book knowledge can give him; always remembering never to use a new device or make a change without a reason for it, and that where there have been so many great improvements in the past, there is still room for more in the future, for no stamp mill has ever yet been built that was perfect in every detail.

One of the great axioms of successful stamp mill construction is to adapt the construction of the mill and reduction process to the character of the ore to be treated. This in a measure accounts for so many variations in stamp mill construction.

The most truly scientific method in the reduction

make a higher percentage of extraction from these pyritic ores is evidence that their system of mill construction and milling is second to none. If this be true, it is due to the proper recognition of the necessity for changing the modes of treatment and mill construction to conform to the different characters of the ores. These changes did not take place in a day, but are the outgrowth of years of hard work and observation. The mill men of Colorado have been trained in the best of schools, that of experience.

The mine owner should not consider the work finished when the ore is hoisted to the collar of the shaft, but on the contrary, the mill demands the greater experience and attention, and no management can be too careful in placing competent men in charge of the plant.

In the construction of the mill building there are three important factors to be observed: light, heat and room. Nearly all of our large mills are dark in the middle; none should be that way; builders depend too much upon side-wall windows for light. If the mill is not built in elevated sections, so that each department can have its own system of lighting, it is

true that natural rock foundation is better for any machinery, yet it cannot always be secured, and a better rule would be to locate the mill in the most convenient place with reference to the mine and other surrounding conditions, and if there is no rock foundation construct one. This may be a violation of all rules of battery foundation, but like many other rules there must sometimes be exceptions. If a natural foundation cannot be secured, make an excavation deep enough so that the bottom is of a homogeneous character. A foundation partly on rock and partly on sand can never last. A space of 72 square feet, or about 6x12 feet, will be large enough for a 10-stamp battery. On the bottom of this excavation build a cement concrete 3 feet high, using about three parts sand, three parts of broken rubble, and three parts of Portland cement; a coping of about 2 inches on this concrete, consisting of equal parts of sharp sand and cement will give a smooth level surface. After this concrete foundation has thoroughly set, it is ready for either an iron or wood mortar block. In a like manner concrete piers can be built for the mud sills and battery posts. Anchor bolts

System of Timbering, No. 2 Captain Vein, 400-Foot Level, No. 2 Shaft, Portland Gold Mining Co., Cripple Creek District, Colorado. (See Page 187.)

of any ore is certainly the most sensible, and it is one of the duties of every mill constructor or mill man to determine what are the exact conditions required, and then arrange his mill to them. If a stamp mill is to be the process employed in the treatment or reduction of a particular kind of ore, the first consideration in constructing that mill should be the arrangement and design of the process best suited to saving the values in the ore. It is the adaptability of the stamp mill to the ores of a great diversity of character which enables it to hold its own in the wake of the evercoming new devices continually offered by the inventive genius of this generation. It is this distinctive feature of combination that enables the stamp mill to compete successfully, for it is a crushing, amalgamation, reducing and extracting device combined, and despite these new inventions, with the encroachments of the smelter on one side, and the leaching process on the other, the stamp mill still continues to be the simplest and best way of extracting the hidden gold yet invented by the ingenuity of man. It is probably true that the ores of Gilpin county, Colorado, contain a higher percentage of sulphuret than any other gold-bearing mill ore treated by amalgamation at any of the chief milling centers of the world to-day. The fact that they

better to place skylights in the roof, for one skylight will give more light than four windows in the wall of the building. Whitewashed walls and ceilings will aid in producing better light. The amalgamation and concentration departments should be warm in winter. It is best to build this part of the building double board with building paper between the battens on the outside. If the mill has steam power, a very good system of heating can be arranged from the exhaust steam from the engine. If the mill is not equipped with steam power, a good stove or two with large hot-air drums will prove economical of fuel and keep a 30-stamp mill sufficiently warm for operations. Avoid cold drafts of air, for icicles, plate amalgamation and concentration will not work together.

In the matter of room or space, no millwright should try to economize in this particular. Have plenty of elevations between the different departments of the mill, plenty of room around the batteries and the concentrating machines. These three factors, light, heat and space, are not luxuries; they are necessities in every well regulated mill.

Next, we come to the battery foundation. Nearly all stamp mill constructors seem to think that the mortar blocks should be set on solid rock, or rather that mill sites must be chosen with reference to the foundation for the mortars. While it is probably

should be built in the concrete work for holding the mud sills and mortar blocks.

The back knee frame, while it has some objections, is considered best for a battery frame; it gives a solid support to the ore bins, and the pull of the belt to the cam shaft is downward. However, there seems to be a considerable difference of opinion among mill men as to just where the driving shaft should be placed; many insist that the shafting be placed on the battery sills, while others maintain that it is better to place this shaft on an approximate level with the cam shaft. This last arrangement has two or three advantages over the first. There is less vibration at this point than on the battery sills, less dust and dirt; and the use of the belt tightener is not required. The life of the belt in this position is much longer, as has been demonstrated in the mills of South Dakota, where the two arrangements have been used.

The iron battery frame has gradually come into use in Australia; this has added much to the appearance of the stamp mill, but the question is often asked, Does not the iron frame increase the vibration produced by the fall of the stamp? It is generally supposed that the wood frame takes up this vibration better than iron and prevents a crystallization of the iron work of the battery. This question is often a matter of controversy between mill men, but the experience

* Condensed from paper read before the Mining Congress at the fourth session.

of the Australian mill man does not sustain the idea of crystallization, for many of the iron-frame batteries in that region have been running for years without any serious results. The design of the mortar, which is seldom ever left to the millwright or the amalgamator, becomes an interesting question, for the character of the ore may require that the mortar be made an amalgamating machine as well as a crushing; in that case the mortar should be built wide and deep, after the fashion of the Colorado or Black Hawk mortar, which gives room for both back and front inside plates. On the other hand, the ore may be of such a class that inside amalgamation cannot be effected. Notable among this class are the milling ores of Custer county, Idaho. Every attempt at inside amalgamation of these ores has reduced the percentage of extraction. From this experience, the mill men of that district have learned to design their mortar as a crushing machine; narrow, with a shallow discharge. Again, we may bridge between these two extremes and design a mortar with a chock block and front plate only. This modification is to be recommended when both back and front plates cannot be used, for the sooner we catch our gold, the less chance there is to lose it. If it can be recovered in the mortar, it is better not to let it pass out in order to catch it on the outside. Finally, these different modifications become a business proposition to be carefully weighed by the mill manager, as to whether the increased extraction inside the mortar will make up for the loss in tonnage by inside amalgamation.

The depth of discharge, or the distance from the level of the issue to the top of the die is a very important factor, the importance of which is usually underestimated. In the deep discharge mills of Colorado, the distance from the top of the dies to issue is from 14 to 16 inches, while in many other milling centers the discharge is less than 2 inches. These varying conditions usually come from arranging the mortar to suit the requirements of the ore. In any case the discharge should be kept as constant as possible. It is better to put more metal in the stem and less in the bosshead. With a light steel tappet there is less vibration in the stem and consequently longer life. With a steel tappet and the end of the cam chilled, there will be less friction and little wearing of cams.

Shoes and dies should not be the same hardness; better have the shoes of steel, and the dies of cast iron.

Tables for the apron plates should be made heavy and solid and of the best material; usually 3x5-inch pieces, spiked together and dressed to an even surface on the top side, $\frac{1}{4}$ inch lower in the center, with a side rail on either side $1\frac{1}{2}$ x20 inches. This will make a solid bed for the plates. If the tables are long, 12 or 16 feet, it is better to divide them into two sections of 6 or 8 feet each, with a drop of 2 inches between the two. The pitch of the tables is another question that mill men do not always agree upon. The tendency in later years is to give the plates more pitch. The pulp in this case requires less water and gives it more of a rolling motion; a 2 or 2 $\frac{1}{4}$ -inch grade seems to give the best results.

The weight of the stamp varies from 500 pounds to the heavy stamp of 1250 pounds or more; only the prospecting mills have lighter weight. The most desirable weight for a given ore depends much more than is usually supposed upon the required conditions favorable to amalgamation. The light stamp of Colorado is an outgrowth of one of these conditions; while on the other extreme, the heavy quick drop of California is desirable on account of its great crushing capacity. A series of experiments carried out by the Alaska-Treadwell Co., among others, demonstrated that a stamp heavier than 1000 pounds was a good pulverizer, but not a good amalgamator. Likewise the same conditions have been found to prevail with the heavier steam stamp on gold ores of the Black Hills. The arrangement in the order of drops of the stamps in a battery must be arranged according to the work required. For rapid crushing, the order 1, 5, 2, 4 and 3 will work well, while for the long, slow drop of the Colorado mill, the order 1, 5, 3, 2 and 4 will give an even distribution of ore in the battery. The order 1, 4, 2, 5 and 3 for heavy stamps and inside plate amalgamation will give good results. The order 5, 1, 3, 4 and 2, commonly used in Australia, is a very good system, but the order of drop is more a fancy of the mill man, rarely any two men using the same drop.

We find in general stamp-mill practice these three classes of plates in use—the plain copper, the silver-plated copper, and the Mutz metal, a composition plate 60% copper and 40% zinc. While the plain copper is used in many mills, it is not to be recommended in any instance, and although its first cost is less, it will not compare with the many advantages that the heavy silver-plated plate has over it. While it is true that in time the silver plating will wear off and expose the copper, and in that case lose some of its

efficiency, it still can be plated again, for no large stamp is complete without a plating arrangement. Again, an old plate will always buy a new plated one. The Mutz metal plate used in Australia is in some instances superior to the silver-plated copper; its absorbing power for mercury is limited, and it is more easily cleaned up than either of the other plates, which makes it better for test runs or custom mills. When the ores contain compounds of other elements, which will cut up the mercury, the composition plate is preferable.

Again, it is said that the zinc in Mutz plates sets up a kind of galvanic action which has a tendency to purify quicksilver. The verdigris, so annoying to the mill man, never comes on the composition plate, but for all conditions, the silver-plated plates are superior to all others. The sluice plates should be made at least as wide as the plates above, instead of

from banking on the plates. Warming the water for amalgamation and concentration in winter is a point to which too little attention is given. This can be accomplished where steam power is used by passing the exhaust steam through a coil of pipe into the water tank. The water should be kept at an even temperature, never exceeding 70°; frequently a lower temperature will do better work. The water tank should be so arranged as to give a constant pressure at the batteries, hydraulic sizers, and concentrators.

Every stamp mill, no matter how small, should be equipped with sizing bars, rock breakers, and automatic feeders; better to have two rock breakers, one for the coarse and a smaller one for the fine ore. Uneven ore sizing and irregular feeding add very much to the wear and tear of the stamp mill. Do not try to make a rock breaker out of your mortar. If it pulverizes and amalgamates your ore, that is all

Hidden Treasure Vein, No. 2 Shaft, 600-Foot Level, Looking North, Portland G. M. Co., Cripple Creek District, Colo. (See Page 187.)

narrower, which is the common practice. The same amount of pulp and water must necessarily pass over them as the upper plates, and the gold expected to be caught by the sluice plate and more difficult to catch than that which has been caught on the plate above; but the reverse of this is generally the case. In most mills the sluice plates are much narrower, sometimes only 20 inches wide, and set at a greater angle, and the little gold caught is more by accident than by reason of design.

It occurs to me that they are excellently devised for carrying off the mercury, the gold and everything else, rather than arresting what has already passed the tables above. The quantity of water used is usually about 750 gallons per ton of ore crushed; this amount is sometimes varied to suit the specific gravity of the pulps, the intention being to regulate this factor so as to produce a slow, wave-like motion as the pulp passes down over the tables, using sufficient water to prevent the heavy particles of ore

that is required. It has been thoroughly demonstrated that the rock breaker is a great saver of mortars, shoes, dies, bossheads, screens, etc. The time lost in a year by the frequent stoppage of the mill in order to replace and make these repairs at once becomes a monetary question, which must be added to the cost of the excessive repairs.

A stamp mill can reach maximum capacity only through the aid of a perfect system of rock breaking, sizing and automatic feeding; besides, these factors are an efficient aid in the matter of amalgamation and concentration.

In the matter of machine feeding, it is safe to say that the automatic feeder is superior in every detail to the shovel, for man is human and the temptations known to stamp mill feeders, or other men, cause them occasionally to neglect their duty. Every mill should have an automatic sampler for tailings. This is an apparatus too frequently left out of the mill entirely. The lack of proper tailing samples is one

of the consequent losses of gold due to had milling, which is the result of ignorance on the part of the mill man as to what he is doing. It is to the mill owner's interest to know what is being lost in the tailings. It is to the mill man's interest to have the tailings run low; the hand sampler will soon learn to sample to an idea of his own, while an automatic sampling machine can not be coached. The grinding pan or clean-up barrel is another machine frequently left out in the construction of mills. Many mill men object to these as an aid in cleaning the residue from the mortars after taking out old shoes and dies; they claim that the grinding process of the machine causes the mercury to flour and a loss is sustained. This loss can generally be prevented very easily by giving the barrel a slower motion and adding a small amount of perchloride of iron to the contents to be ground. Mercury traps should not be discarded where amalgamation is

lunch. Mine owners do not like to spend a few hundred dollars in advice or experiment previous to the construction of a milling plant, but actually enjoy ordering a \$150,000 mill, and, too frequently, after it is completed and put in operation, they find that the plant or process is not adapted to the character of the ore, and, from this frequent haste and ill judgment, we find so many failures in our mining camps, which are monuments to folly. Among these many failures, the question often comes up: "Will the stamp mill continue to survive, amid the many inventions daily made; will it continue to compete successfully with the unending number of pulverizers and amalgamators, together with the army of new processes which the active brain of man brings forth from time to time?" Looking over the field of competition and the continued failures of the army of ill-devised machines, which their originators fondly he-

Mistakes of Miners.

From that section where California, Nevada and Arizona boundary lines approach, an old-time miner and traveling correspondent sends a letter which is chiefly of interest in contrasting past conditions in the business of mining. Revisiting where he was an active worker many years ago, he says:

The first thing which caught my eye was the relics of an old concentrating plant built eighteen years ago, and which cost a man in San Francisco who put the money up for a relative, \$86,000. It had five stamps and two concentrators. Miners from all over the county brought their ore to it to have it concentrated so as to save freight charges, which was in those days \$125 a ton to San Francisco. I mention one case in particular to show you how the miners fared. One mine owner brought in to the concentrator over five tons of ore which assayed \$264 per ton. He wanted to ship his ore to San Francisco, and to save the freight charges of \$125 per ton he concluded to have it concentrated, the five into one. He was advised by an old miner and mill man not to do it, but he did, and after the five tons were concentrated into one the one ton of concentrates assayed \$266 a ton. The man who brought the ore in and who was superintendent for the company walked the floor, but to no purpose. His values as per ore assay were gone, and others were treated the same way. The concentrator, or those who run it, was a failure, and it got no more work to do. It lay idle for a long time, and the concentrator that cost \$86,000 was finally sold to a man who moved it away, for \$2500.

Half a mile further I came to a 5-stamp chlorination mill that was built in the winter of 1875-76, and it was one of the best built and best equipped little mills built on the coast; but the siding on that mill and the shingles are not paid for to this day. The mill turned out the first bar of hulsion in February, 1876, and everybody had a grand time, had a ball in a saloon, where they preached and prayed on Sunday for want of a better place.

A little history of the workings of that mill, the crushing of ores and the treatment miners got would be of interest to your readers.

Chloriders and miners would take their ore to the mill to have it crushed, the mill man charged \$50 a ton for crushing, and he allowed us 80% of the assay value of the silver in the ore; nothing for gold, no matter how much was in our ore. They claimed they didn't save it, that it went up and out of the smoke-stack. He charged 15% discount on all the hulsion and from 2% to 10% moisture. So that really if a miner took \$100 ore to the mill he was lucky if he got his sacks back, which he paid 25 cents apiece for. And in this connection let me enumerate some of the prices we had to pay to produce that ore: Powder, \$1.50 per pound; fuse, \$2.50 per 100 feet; caps, \$2.50 a box; candles, 75 cents and 80 cents per pound; a plug of tobacco, \$1.25; sugar, three pounds for \$1; bacon the same; hams, 45 cents to 60 cents per pound; flour, \$13 per 100 pounds, and all things in proportion.

But there came a change. The superintendent of that mill company paid a great many chloriders for their ore in checks on a bank in San Francisco, and by some hocus pocus they had no mail come there for three months. Finally the checks came back endorsed, "Not paid for want of funds," and the superintendent left there between two days and forgot to come back; then the sheriff steps in, and after the necessary time the fellow that charged them the above price bought it. After a while he started the mill up on the same old basis. The miner paid him the same old prices for what he ate and wore, and so you may judge the enormous profits they were making out of the miners. He ran the mill at odd times for about three years, working ores up only to 60%, for the reason that those he hired to run it did not know their business and they were not chloridizing their ore. But there was a great mass of tailings accumulating from ores that would mill over \$500 per ton, and when they learned their business from a man who came there they worked those tailings all over and made a fine clean-up run a while, and sold the whole business to an Eastern company from Ohio. The Ohio company sent out a man to work the mine and mill, with the result that they had better paid him \$1000 a month to have stayed in Ohio, as he did not know hardly what he was sent out for, only his health and spend stockholders' money. So there was a "failure," the mill shut down, a man was hired to watch it; he finally sold the company for his pay, the stockholders wouldn't put up any more money under the management, he got judgment and now the mill is his, and it is hardly worth that much old iron, but there it stands, rotten and rusty from the foundation up, a "monument of rottenness

Captain Vein No. 7, 400-Foot Level, No. 2 Shaft, Portland G. M. Co., Cripple Creek District, Colo. (See Page 187.)

carried on by stamp mills. The arrangement of the stamp depends somewhat upon the location of the mill; if the site is level and the mill large, it is better to arrange the battery in two rows back to back; when a graded mill site is used on a sloping hillside, the batteries are arranged in one single row. This is a better arrangement, as the hillside gives the desired elevation for the different departments of the mill and makes a better condition for lighting the building.

The stamp mill of late has suffered much in reputation from the frequent failure of the designer or constructor to adapt the arrangement and construction of his mill to the character of the ore to be treated. The mine owner orders his reduction plant about the same as a man orders his dinner; he goes to the agent of a well-known manufacturer of machinery and tells him about the mine and the probable character of the ore, and then leaves the plan and management of the mill to him, the same as a man enters a restaurant and directs the head waiter to serve him with a good

lied would revolutionize the reduction of ores, there is every reason to believe that the stamp mills will continue to survive amid all of these new inventions and enjoy a career of further usefulness.

In conclusion, to mine owners and mill men who intend to build stamp mills: First, study the character and requirements of the ore to be treated, and, if necessary, go to some expense in experimenting to find out the true process of your ore; or, better still, employ a competent expert in that line, who is able to judge which is the real system by which to treat your ore. That done, design your mill according to these conclusions; employ the most competent millwright to superintend the construction of your plant, a man who can run the mill after he has built it and understands every detail of its operation; use your stamp mill intelligently and observe each and every one of its continued operations; take advantage of every occasion to use any new contrivance or change, which experiment and common sense may sanction.

and bad management," and a disgrace to the camp. An old timer says it would have been a blessing to the district if it had burned down before it turned a wheel.

Proceeding to the town: On the corner is an old Courthouse which is said to have cost the taxpayers over \$26,000; it never was worth over \$2500. The county must have been cursed with as bad a gang of boodlers as St. Louis. There is one store, saloon adjoining and Postoffice, the regular gang of sitters holding down chairs, all waiting for some one to come in and ask them to drink, peering and wondering who we are and why we intrude on their seclusion. They abuse people who come in to do something and abuse them if they don't, and the big fat fellow who runs the place laughs and joins with them in a drink. There will be a day, and it is not far hence, when there will be a chlorination plant and works here, with tramways from the different hills and mines right into the mill pounding away on rich ore. Ores can be worked here for \$3 per ton with the proper mill.

Shaft Sinking.

Written for the MINING AND SCIENTIFIC PRESS by
C. K. COLVIN, M. E., Denver, Colo.

So far as the writer knows, little has ever been written on the subject of sinking and timbering perpendicular cage shafts by the mining engineers of the country for the working of metalliferous mines. I have given this subject a great deal of thought and study, and it has been my fortune to have had the opportunity to put my ideas into practical application.

As every miner knows, the shaft of a mine—if it be worked by shaft—is the principal thing about it; in fact, it is the mine itself, and, further, it is the most expensive part of mining and, consequently, should be done intelligently.

When a shaft is completed, or, rather, when it is started, it should be of sufficient size to accommodate the transportation required, and no larger, as it is useless to spend time and money in breaking and timbering extra space that can not be utilized; it adds to the expense and there is no return from it.

The last shaft sunk by the writer was, in his opinion, as near the proper size for the ordinary working shaft as can well be figured. This shaft was 5'x12' in the clear, divided into three compartments, making two cageways and a third compartment to accommodate ladders, columns, etc. This necessitated an original break of 7'x14', as 8'x8' sawed timbers were used. If it were in bad, heavy ground, large timbers would, of course, be necessary. In the breaking two 3' air drills were employed, working on crossbars at each end of the shaft. These columns, if properly set, will enable the operators to drill up their rounds without any change of setting; it allows them to keep the corners out, as well as giving a good slant to the sump holes, and in ordinary ground nine holes on a side will complete the round. The depth of these holes depends on the cut or sump, and that, of course, depends on how the ground breaks.

In dividing this size shaft into three compartments, allowing for two 6' dividing pieces, it leaves two hoisting ways 4'x5', and a ladderway 3'x5'; using 4'x6' guides, the wide face in the shaft leaves a hoisting compartment 3' 4'x5' clear of everything. This will accommodate a cage with a 20" or 24" gauge track, and an ore car with a box 2' high, 2½' wide and 4' long, having a capacity of 20 cubic feet, which in round numbers is equivalent to one ton of broken rock. When these cars are new and stiff, they are about all one man can handle, but after they become worn and limbered up one man can handle them very easily. Hence, they are about the maximum size. They are not so high but that men can shovel into them handily; otherwise they might be built 6' higher, in which event they would hold 25 cubic feet, or about 1½ tons. This, however, would be too much for one trammer and not enough for two.

Some one may say that the sized shaft mentioned above is all right, but too small for a big mine. It is possible to hoist through this shaft, with double-deck cages, 2000 tons in twenty-four hours, which allows about three minutes for each trip, and most all of the heavy-duty hoisting machinery of to-day is guaranteed to hoist from 1000' to 2000' per minute. There is one condition, if encountered, in which this shaft, or, rather, the compartment for ladders and columns, might be too small, and that is where there is an excessive flow of water to be handled, in which event the shaft should be made 2' longer (5'x14' in the clear) which would make the pumpway 5'x5'.

These cages will accommodate nine men on each deck, or thirty-six men on the four decks at each trip.

For general uniformity and from an economical standpoint, the writer is of opinion that the dimensions herein given of shaft, cages, etc., are well adapted for any ordinary mining.

The square or staddle sets employed in timbering the above described shaft are very much the same as the ordinary set, with the exception that these sets have a 1' miter at the ends or corners, as well as being shouldered, which gives the full strength of the timbers, placed from 4' to 6' apart, depending on the weight and condition of the ground.

The shaft in question was sunk 900' and the records

show only three broken timbers from blasting. This was accomplished by what the miners called "the float." This not only protects the timbers, but also protects the men in the bottom of the shaft, as well as forming a staging, or platform, on which the timber men do all their work, and permits the work of timbering and sinking to go on at the same time without hindrance to either in any great degree. The timbering in this shaft was kept as close to the bottom as possible to allow head room for the shaft men.

The "float," after being constructed in several different ways, was found to be more durable when built as follows:

Take two thicknesses—three would be still better—of 1" boards, laying one lengthwise and the other crosswise, and nail together, after the fashion of a barn door. On each side of this bolt one ¼" boiler plate, covering the entire surface on both sides; use ½"x3½" bolts; put clear through and draw up tight; use plenty of them. The wood center acts as a cushion and protects the plate. Eyebolts should be put in near each corner, connected with chains across the ends.

Swing the float under the last set of timbers by means of chain blocks, hooked into the chains connecting the eyebolts, at each end of the shaft, the blocks being suspended from cross pieces resting on the sets above. Two-ton chain blocks will handle it, but heavier ones are better, as there is a heavy strain on them. The float should be built large enough to extend beyond the timbers at least 2 inches on all sides when swung into place. It will be necessary to put this together in the bottom of the shaft, as it will be too large to go down—under the middle compartment, which should be used as the bucketway when sinking, as it lands the bucket near the center of the shaft, where the muckers get on all sides of it. There necessarily must be a hole for the bucket to pass through to the bottom. When blasting, this is closed with some kind of a chain net, and the float should be drawn up tight against the timbers.

When the shaft is ready for another set, the timbermen drop down onto the "float," and, by means of the chain blocks, lower it down the proper distance, and they are ready to go at their work without any material interference to the shaftmen under them. After several months' use, the float will become cupped up from the force of the blasts underneath it. When this happens, lower it down to the bottom and turn it over, and that same force will straighten it out again.

When a bucket is employed in a shaft of this kind, it is necessary to use an idler or crosshead to keep the bucket from swinging. This is simply a frame working on the guides, supported by the chain hook or bail of the bucket. Near the bottom of the timbering or guides there should be chockblocks to stop it from leaving the guides and going into the bottom of the shaft, the hole in the idler being large enough for the cable to slip through and allow the bucket to pass on to the bottom.

Another very convenient device employed by the writer was a bell line contrivance. As every miner knows, a good bell line is a very important thing, es-

pecially when sinking, as very often endless trouble and delay are caused. Wires of an electric signal are not good in the bottom of a wet, muddy shaft, and a line with knots and splices is equally as bad. The device referred to is simply a wooden drum 24" in diameter, with an 8" or 10" face, with 4" or 6" flanges, dependent on the amount of rope required. Put a 1" round iron shaft through it, loose; take a bar of iron ½"x2½"x4' long, drill hole 14" from end and slip onto the shaft; attach small line to short end of bar or lever (wire preferably), pass over small pulley and into engine room, where attach to bell; on the long end of the lever put counterbalance to take up weight of the line suspended in the shaft. A weight is better than a spring for this purpose. Have the long end of the lever work in a slot so as to control the sweep, which will be from 6" to 12".

On the side of the drum next to the lever put four engaging dogs, made out of ½"x1" iron; put on with screws; place near the outside rim at equal distances apart, so that two dogs will engage at the same time, the dog at the short end of the lever resting on the top side of the lever and the other one reversed, so that when the drum is turned toward the short end it pulls the lever down and rings the bell in the engine room. The shaft line, whatever length required, is suspended in the shaft (¾" hemp), the surplus wound on the drum; the drum is then located as near over the collar of the shaft as possible, avoiding sharp angles for the line, the drum shaft being set in horizontal bearings.

Whenever it becomes necessary to lengthen the shaft line, simply turn the drum back until the dogs release or disengage the lever, then unreel whatever length of line is required, re-engage the dogs and the line is again ready for use. Sufficient space must be left between the drum and the bearing to permit the lever to be slipped clear of the dogs when lengthening the line, which is a matter of 2" or 3".

There is one thing more the writer wishes to speak about, and that is cage chairs. Never put them in a shaft. They are dangerous and expensive. There are several different patents of chairs that are attached to the cage; in the opinion of the writer, any one of these is preferable to the old-style chairs, which necessitates a set at each level. The writer has, however, used but one of the many different styles, and that was the Jelinek safety chair. For safety, convenience and economy there is absolutely no comparison between this and the old style.

RECENTLY the steel smokestack of the electric light plant at Canton, Pa., 100 feet high, needed painting. The fireman made a sort of kite or parachute which snugly fitted inside the stack. He attached a string to the parachute; the draft in the stack carried it and the string with it up through the stack and out, the parachute coming down outside the stack. A small rope was next tied to the string and pulled up, and finally a rope strong enough to hold a man. Then tackle was arranged to haul up a man to do the painting.

To date 1280 patents for using oil as fuel have been granted by the United States Patent Office.

Hoisting Engine at Oliver Iron Co.'s Mine, Ely, Minn.

In the issue of the 20th ult. appeared a technical description of a new double-drum Corliss engine, built by the Sullivan Machinery Co. of Chicago, and installed at the Savoy-Sibley shaft of the Oliver Iron Co.'s mines near Ely, Minn. By mistake, another

illustration of one of the Sullivan Co.'s make of hoists appeared therewith. The illustration that was designed to accompany that article is here given place. Reference thereto, in connection with the article on page 164 of the issue of the 20th ult., will make the entire matter clear.

Mining and Metallurgical Patents.

Patents Issued September 23, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF ELIMINATING THE SULPHUR FROM SULPHIDE ORES.—No. 709,482; A. Gutensohn, London, England.

Process for elimination of sulphur from sulphide ores, consisting in crushing ore, mixing it with crushed iron pyrites, carbon and sodium salt which will yield sulphide of sodium when mixture is heated, amount of carbon added being largely in excess of amount required to form sulphide of sodium, heating mixture to temperature approaching incipient redness, adding sodium chloride during heating, then exposing it freely to air to effect oxidation; burn off all sulphur that is set free.

AIR COMPRESSING APPARATUS.—No. 709,520; E. J. St. Croix, Madrone, Wash.

Apparatus for compressing and storing air; reservoir; main conduit adapted to convey air under pressure to reservoir; gate valve to control conduit; second gate valve in conduit closely adjacent to reservoir; auxiliary conduit adapted to convey steam to main conduit; gate valve to control same; driving cylinder; branch conduit leading from main conduit to cylinder, having gate valve therein; double series of air compressing cylinders, each of less length of bore than driving cylinder; series arranged within cylinders in tandem, disposed at opposite sides of center line of driving cylinder; conduit leading from one head of each compression cylinder to reservoir; port of ingress in end; check valve in last conduit; check valve arranged to control port; piston rod for each series of cylinders; like rod for driving cylinder; oppositely disposed levers operably connected to rod of driving cylinder, arranged to drive piston rods of compression cylinders; valve-operating mechanism for valve of driving cylinder, operably connected to one lever; manually operative air pump connected to reservoir.

CENTRIFUGAL TAILINGS ELEVATOR.—No. 709,721; W. Peck, Dunedin, New Zealand.

In machine of class described, wheel provided with beaters, being mounted for rotation, being free of an inclosing casing, whereby, on rapid rotation of wheel, material supplied thereto will be centrifugally scattered, standard of wheel being swivelly mounted.

APPARATUS FOR TREATING PULVERIZED ORES OF GOLD OR SILVER.—No. 709,593; D. C. Boley, Chicago, Ill.

Apparatus for treating finely divided ores by filtration, combination with moving filter surface, of means for creating vacuum beneath filter as it passes portion of its course, means for producing at same time air pressure backward through filter as it passes another portion of course, means for producing at different time air pressure backward through filter, at same portion of its course, combination of rotatable barrel having around its inside surface series of chambers separated from interior of barrel by filtering fabric, means for inducing vacuum in chambers during portion of revolution of barrel, in part of pipes containing valves controlled automatically by cam caused to operate by motion of the barrel.

CHILIAN MILL.—No. 709,689; G. F. Waddell and W. J. Evans, Anaconda, Mont.

The combination of main shaft, sphere mounted thereon, spider hub loosely mounted on sphere, journal arms projecting rigidly from hub, rolls mounted on journal arms, die co-operating with rolls, drag arms projecting from hub, journal pins carried by drag arms, rotary annular pan discharging on die and rolls, secured to shaft above hub, journal pins projecting from bottom of rotary pan, links connecting journal pins of water pan to those of drag arms.

ORE CRUSHING MACHINE.—No. 709,822; C. C. Lane, Los Angeles, Cal.

Ore crusher, comprising revolving frame; revolving crushing rolls mounted in frame; tread for rolls composed of plurality of concentric rings, having spaces therebetween; supports for rings; screens below tread, adapted to deflect crushed ore into troughs

at side of and below tread; arms affixed to revolving frame, having scrapers on bottom thereof, adapted to work in troughs.

ELECTRIC IGNITER FOR EXPLOSIVE ENGINES.—No. 709,598; H. A. Gray, Plainfield, Ill.

An explosive engine, in combination, cylinder, valve therefor, cam driven by engine moving rod, movable electrode, second electrode, shaft comprising two sections to one of which second electrode is fixed, clutch for coupling two shaft sections, one of the members of which is slidably mounted upon shaft, pin projecting from clutch member, arm secured to valve rod having beveled extension for engaging pin to uncouple clutch and also turn shaft section to which electrode is fixed, spring for coupling clutch when arm is withdrawn from pin, governor, pivoted lever actuated by governor for engaging valve rod when advanced by cam.

ROTARY SLIDE VALVE FOR PUMPS, COMPRESSORS OR MOTORS.—No. 709,682; L. Roedel, Passaic, N. J.

Combination, with two stationary cylinders having interior inlet and outlet channels, of slide valves on heads of cylinders, shafts connected with slide valves, means for imparting rotary motion to shafts, balancing device between inner ends of shafts, balancing device consisting of differential piston, larger piston, cylinders for piston, couplings between shafts and cylinders.

MINING DREDGE.—No. 709,733; H. J. Barton and A. C. La Buò, Oakbar, Cal.

In mining dredger or excavator, scoop of shovel form, draft loop connected to lateral walls of scoop just above center of height thereof, rear handle lever pivoted to scoop, catch carried by scoop for holding lever upright, loading drum located near surface of

ground, draft or loading cable carried by drum, connected to draft loop, hoisting cable connected to handle lever.

CONCENTRATOR.—No. 709,770; J. A. Holmes, Salt Lake City, Utah, J. F. Wood, Denver, Colo.

An ore concentrator, comprising sluice box, means for imparting longitudinal reciprocating motion to box, series of pans arranged in box one above another, pans being longitudinally curved and inclined laterally, discharge openings through side walls of box at highest side of pans, discharge and inlet openings at opposite side of box, reservoir upon which box moves, receiving pan carried by box adapted to be submerged in water contained in reservoir, inclined amalgamated plates for receiving material from receiving pans, plates being arranged in reservoir, mercury troughs supported below plates.

MANUFACTURE OF ALLOYS OF THE ALKALI METALS.—No. 709,489; G. F. Jauhart, Paris, France.

Method of manufacturing alloys of alkali metals, such as potassium and sodium, which consists in mixing one of the metals with caustic oxide of other metal, then heating mixture in vacuo at temperature of from 200° to 300° C., and in then allowing residue to cool.

PROCESS OF PRODUCING CYANATE OF POTASSIUM.—No. 709,570; S. Zuckschwerdt, Leopoldshall, Germany.

Separation of cyanate of potassium from cyanide and carbonate, thereby producing pure cyanate of potassium, first treating salt mixture obtained from synthetic cyanogen processes, with sufficient water to dissolve carbonate temperature not over 66° centigrade, whereby cyanide and cyanate remain undissolved, then treating remaining undissolved salt mixture with sufficient water to dissolve cyanide temperature not exceeding 5° centigrade, whereby cyanate remains undissolved.

ELECTRICALLY TREATING ORES.—No. 709,817; C. E. Dolhear, Boston, Mass.

Method of reducing metals from their ores which consists in dissolving crushed ores in nitrate of suitable metal, adding to mixture thus formed sulphuric acid, subjecting solution to action of an electric current, whereby metal is plated out of solution.

PROCESS FOR TREATING TELLURIDE GOLD ORES.—No. 709,038; W. Pethybridge, London, England.

Process for recovery of gold and tellurium from telluride of gold contained in ores, consisting in treating pulverized ore with solution of ferric sulphate, used alone; separating filtrate from solid residue; treating residue for recovery of free and solid gold therein, treating filtrate for precipitation of tellurium by metallic iron and boiling, separating further filtrate of ferrous sulphate, and converting ferrous sulphate into ferric sulphate by oxidation.

PROCESS OF MELTING NICKEL.—No. 709,218; H. L. Haas, New York, N. Y.

Continuous process of melting and refining nickel containing carbon, consisting in subjecting column of mixture of nickel in granular form directly with fuel to heat; passing large quantities of air under excessive pressure upwardly through entire column of nickel and fuel, to assure temperature above melting point of nickel and to oxidize carbon in nickel; allowing melting nickel to flow downwardly through mass and in contact with air, drawing off melted nickel with more or less continuity below column; supplying

fuel and granular nickel as necessary to top of column to maintain temperature and continue process.

PROCESS OF DESULPHURIZING FURNACE GASES.—No. 709,358; E. Pollacsek, Budapest, Austria-Hungary.

Method for desulphurizing furnace gases which consists in passing gases through sponge-like material formed by action of gases upon mass consisting of ten to fifteen parts by weight of sawdust, thirty to thirty-five parts by weight of not-caking fuel, twenty to twenty-five parts by weight of caking fuel, thirty to thirty-five parts by weight of peat and six to twenty parts by weight of caustic lime.

The Gold Production of North America, Its Geological Derivation and Probable Future.

NUMBER II.

The most important gold belt in North America is that stretching along the Pacific coast. It is throughout characterized by free-milling quartz ores with auriferous sulphides. A great erosion has taken place since it was formed, and here, too, as in the pre-Cambrian deposits, we have to deal with the lower part of veins, the upper parts having generally been removed to the extent of thousands of feet in many places.

Beginning in Baja California, Mexico, 100 miles or more below the boundary lines, this great belt continues through San Diego, Los Angeles and Kern counties up through the central part of California, where it is developed in great strength; then up to northern California, southwestern and northeastern Oregon. In the latter State it is modified by the appearance of many silver-gold deposits and veins carrying auriferous sulphides without free gold. Covered for a distance by the lava flows of the Cascades, it again appears in southern British Columbia, on Vancouver Island, among other places. Strong development is again attained in the Cariboo district in central British Columbia, and it continues through Omineca, Cassiar and Atlin districts to the Klondike region, and thence, bending westward, follows the Yukon to the western end of the continent at Nome, on the Seward peninsula.

Throughout this immense stretch of country the veins are accompanied by great development of placers; they are indeed characteristic of this class of gold veins and by far most of the product has been obtained from placers. At many places in California, as well as in Oregon and Alaska, the veins from which these placers were derived were very disappointing, the fact being that the primary deposits are often scattered in many little seams, rather than concentrated in great veins. California alone has yielded \$1,300,000,000 from this belt, Oregon \$55,000,000, British Columbia and Northwest Territory \$120,000,000, Alaska \$31,000,000; a total of over \$1,400,000,000. During 1900 the belt yielded \$50,000,000, of which one-half came from British Columbia and the Yukon. This represents a great increase compared with the figures of ten years ago, and the question is whether this increase will be maintained. At least \$27,000,000 were obtained from the new placers on the Yukon and in Alaska.

If no further great discoveries are made in this region our knowledge of placers forces us to the belief that this last figure will rapidly decrease. Even if the placers gradually decline in the northernmost territories, it is believed that increased quartz mining will in some degree compensate for this; but the quartz mines have usually in the older districts yielded less than the corresponding placers. California's output will doubtless be maintained at about the present figure for many years.

Besides the Pacific gold belt there is a broad zone in the central and eastern part of the Cordilleran region which contains an abundance of Mesozoic gold deposits. Many of these seem to have been formed a little later than the California gold quartz veins, perhaps largely at the very close of the Cretaceous, or possibly at the very beginning of the Tertiary period.

This broad zone begins in Mexico, where the Pacific States of Sonora and Sinaloa contain many veins in pre-Cretaceous sediments, granites and crystalline schists. Some of those in Sonora occur in Triassic rocks and are considered to be of the same age as California veins. Similar deposits in old rocks continue through the southwestern part of Arizona, but their age is not definitely known. Prominent veins are those of the Congress, Fortuna and Gold King mines.

Similar deposits appear again in Nevada and Utah. In Nevada a few of them are free-milling gold quartz veins, but in the majority the ores are sulphides alone and silver exceeds the gold as to the value in them.

In Utah the principal gold mines are those of the Mercur district, in which ores suited to the cyanide process occur in limestone close to intrusive sheets of porphyry. These yielded over \$2,000,000 in 1900. Most of the remaining amount credited to Utah is derived from gold-bearing ores of the smelting class, which are found in veins and irregular deposits in sedimentary rocks close to bodies of intrusive (Cretaceous?) porphyries. The future of the gold pro-

duction here is very closely connected with the vicissitudes of the silver market. In Colorado the most important Cretaceous gold deposits are those of Leadville. Here, again, the ores occur in carboniferous sediments near porphyry contacts, and the gold production, small until a few years ago, reached \$2,700,000 in 1900.

In Idaho and Montana the late Mesozoic veins are developed on a large scale. We note here the interesting fact of a junction with the Pacific belt, through northeastern Oregon and central Idaho, into Montana. Going eastward, the free-milling and quartzose character is partly maintained, but silver becomes more prominent in the ores, and auriferous smelting sulphide ores often replace the native gold. Central Idaho contained many rich placer camps which have yielded their millions, like Oregon, and in Montana the first years of mining were largely monopolized by the placer deposits. The great producing quartz mines contained, however, much silver, and the pan amalgamation is the most common process.

After the exhaustion of the placers, silver ores containing a little gold were extensively worked by smelting. This industry has declined during the last years and, instead, at least \$1,000,000 per annum is obtained as a by-product from the smelting of Butte's copper ores.

The majority of gold-bearing veins in Idaho and Montana are genetically connected with the intrusion of very large bodies of granitic rocks during the Cretaceous and very earliest Tertiary period. This explains the fact of relationship with the Pacific gold belt mentioned, for there, too, the veins stand in undoubted casual connection with the great Mesozoic granitic "batholiths," as the large intrusive bodies are called. As far as we know, these batholiths are either absent or only developed on a small scale in Nevada, Utah and Arizona. The veins were found in this granitic rock and also, perhaps, chiefly in the zone of more or less altered sediments surrounding them. They were undoubtedly formed after the consolidation of these granites and probably by waters heated by the vast coloric resources of the intruded rocks.

Montana has probably produced about \$175,000,000 of gold since discovery, and the output in 1900 was \$4,700,000. Milling and cyaniding ores contributed \$2,300,000, copper ores \$1,100,000, and other smelting ores \$700,000. The placer output was \$500,000.

Looking at this of the central Cordilleran gold belt as a whole, it is believed that, north of Mexico, it has produced at least \$310,000,000 since discovery, and during 1900 its tribute to the total of North America was about \$16,000,000.

In this great chain of deposits the gold production is closely associated with the silver and copper industry. The effect is, perhaps, to make it more stable. According to past experience, no wonderful increase of production may be expected, but rather, perhaps, a steady maintenance and, perhaps, a gradual increase. Placer mining, with its dwindling tendency, is almost eliminated in the consideration of this belt.

(TO BE CONTINUED.)

Crocker-Wheeler Branch Office Managers' Convention.

The Crocker-Wheeler Co. held at its works at Ampere, N. J., on September 25-26, its annual managers' convention. On the evening of the 25th the annual banquet was held at the Engineers' Club. Those present were the officers of the company—Schuyler S. Wheeler, Gano S. Dunn, W. L. Brownell, Putnam A. Bates, C. N. Wheeler and F. V. Henshaw; and the branch managers, Samuel Russell, Jr., Julian Roe, J. Hally Craig, Louis P. Hall, W. H. Wissing, Francis B. DeGress, Henry J. Sage, William A. Dohle and Harold Lomas.

At this dinner there were many interesting speeches made by the branch office managers who came from the various districts throughout the entire United States. During the evening Francis B. DeGress of the company's New York office, he having been in the service of the company longer than any of the other branch office managers, presented to their general sales manager, Putnam A. Bates, in the name of the managers, a token of their esteem and an acknowledgement of his efforts in their behalf, which Mr. Bates responded to in his usual happy manner.

The purpose of the convention is to bring all of the men closer together and give them an opportunity of comparing notes and planning methods for handling the largely increased business of the company.

Specimens Wanted.

TO THE EDITOR:—Can you tell me a locality in California or Oregon where I can get a ton or more of nicely colored rose quartz, handy to transportation, and the name of anyone I could write to? Also, can you give me the same information in regard to pink satin spar and Iceland spar? F. T. S. Copper Mountain, Alaska.

At a meeting of the American Institute of Electrical Engineers in New York City last Monday, President Scott said that since the organization of the institution in 1884 the value of electrical installation in the United States, outside of telegraph and telephone plants, had increased from \$1,000,000 to \$4,000,000,000.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Near Anvil creek, the ancient channel gravel beds above the present water course are being worked. Twenty men are at work on No. 4 above, ground sluicing and shoveling in, and the work is paying satisfactorily. Sixteen thousand dollars was cleaned up after a three-days' run. No. 5 Anvil has lately been bought by the Pioneer M. Co. for \$125,000.

Manager Leland of the Mlocene Ditch Co has brought 5000 inches of water to Anvil mountain and will be able to deliver it on the creek under a 300-foot pressure. He agrees to handle the tallies of the creek properties and pay the owners of the claims a bigger percentage of profit than they obtained from working the ground. The pumping plants are proving a success, the first cleanup from Copper Gulch, where but little profit was made by old methods by the use of water supplied by the pumping plant amounted to several thousand dollars.

The Hot Air mine is on Glacier creek. One afternoon five sacks of gold, representing \$48,000, was brought in, representing one cleanup and the work of sixteen men shoveling in for ten days. In fourteen days this mine is reported to have yielded \$71,000 in gold dust.

At the Hot Air, Pioneer and other mines the season is so short in which sluicing and hydraulic mining can be carried on, it is imperative for the miner to utilize every available hour of time and there is no cessation of work night or day.

No. 6, owned and operated by the Pioneer Co., is yielding heavily. No. 8, the banner claim of the creek, continues to yield as heavily as any claim in the district. But little work is being done on 9, 10 and 11, owing to the scarcity of water. The prayers of the miners of Anvil, if they do, is for rain, and plenty of it. They figure it is just as easy and twice as profitable to run three sluings of boxes as one.

Juneau reports that the Rodman Bay section has started up again. One hundred men are employed at the Rodman Bay mines.

ARIZONA.

COCHISE COUNTY.

Ross, who with Nichols won the world's drilling championship at Bisbee last 4th of July, is reported to have made a good strike of \$125 ore in a new prospect near Bisbee.

The Bisbee Miner says: At the Modern Mining Co. sinking is resumed; drifting on the 200-foot level in ore will be continued.—At the Copper Glance fourteen men are employed.—The Black Diamond mine, 4 miles from Pearce, has machinery installed.—The Calumet & Arizona is having smelters built at Douglas. It is expected that they will be blown in Nov. 1.

For about two months, says the El Paso News, mining men of El Paso have been negotiating for the purchase of the Vulture mine.

The Old World Fair M. Co. property, twelve claims, owned by Shattuck & Williams, 2 miles east of Bisbee, shows ore that gives 30% copper. Hoisting machinery has been ordered.

The Copper Queen M. Co.'s daily output and shipment of copper will remain about the same until the completion of the new smelters at Douglas. Superintendent Douglas has returned and there may be considerable new work started.

GILA COUNTY.

President Smith and some of the other directors of the Old Dominion Co. are to visit the mine. The recent shut down of this mine and smelter has been such a calamity to Globe that hopes are entertained that this visit means something toward the resumption of operations.

The Globe Silver Belt is told that the United Globe has from the Federal smelter at El Paso a flat rate of \$13 per ton on copper ores shipped from Globe, payment to be made by the Federal on a basis of 3 cents below New York quotations on electrolytic copper, and that lessees are preparing to take out ore for shipment.

GRAHAM COUNTY.

H. C. Anderson, superintendent Shannon Copper Co., is building a new concentrator and expects it to be running May 1, 1903. It will be framed of wood, instead of steel, as first intended, as owing to the orders now piled up in the steel mills, it would delay the completion of the concentrator for four or six months if the company should wait until the steel for framing could be supplied.

Clifton says forty-seven tons of copper ore shipped from the Standard Copper

mines to the smelter last week netted \$1002. Ninety tons of the same class of ore will be shipped this week. During the present year the Standard has received over \$18,000 net from ore shipments.

MOHAVE COUNTY.

(Special Correspondence).—Going towards Chloride one passes some fine prospects. The Pinkham, Midnight and Sunlight mines are working away taking out ore for the smelter which is to start in a few days. Mr. Heard, the vice-president, is at the smelter having some new machinery put in, which was the cause of his not firing up sooner. The smelter is all right and every one hopes for its success. Everything around here and everybody has a business appearance. The Mluncosota and Conner mines are working away, also the Tennessee. They are starting up the Elkhart above Chloride. There is also talk of starting the Schuykill. Chloride is a thriving, busy place, but in some spots it needs a sanitary officer with a club. That whole section from Todd basin to Chloride is a remarkable mineral region.

Chloride, Sept. 22.

PIMA COUNTY.

F. Brownell, superintendent Producer M. & S. Co., near Covered Wells, Quijota district, near Tucson, will put in a 50-ton smelting plant.

O. B. Steen, of the Eureka M. Co., will put machinery on the mine. It will be hauled to the camp from Patagonia.

PINAL COUNTY.

W. I. Rand of Boston has bonded a large area of silver-lead ground near the Jack Rabbit mine and will begin operations next month.

P. P. Parker of the Copper Mountain M. Co., Copper Butte, 20 miles east of Florence, has the main shaft down 175 feet. The company will erect reduction machinery of large capacity. As they have a large amount of leaching ore in sight, they may elect to erect a leaching plant.

SANTA CRUZ COUNTY.

The Calumet & Arizona Copper Co., at Douglas, will double the capacity of their copper smelter.

YAVAPAI COUNTY.

Near McCabe, on the 27th ult., fire was discovered in the McCabe mine, owned by the Model M. Co., below the 200-foot level. The origin of the fire is unknown. As there are several miles of workings underground, all heavily timbered, it will be difficult to control the fire. The Gladstone mine, which adjoins the McCabe and connects with it, has hunkheaded its levels and there is little danger of the fire spreading to its workings.

At Mayer, on a spur of the P. & E. R. R., M. B. Boss is overseeing the erection of an oil burning smelter for the George A. Treadwell M. Co.

United Verde officials at Jerome have given out that the smelter will be blown in on Jan. 1, 1903. Others say it will not be. From a force of nearly 1000 men a month ago, there are now but five men employed. The superintendent has told those directly under him that they should keep him informed as to their whereabouts, so that they can be sent for when work is resumed, but in the meantime advises them to find positions elsewhere.

Superintendent Martin of the Monarch G. & C. M. Co. says in the drift to tap the ore body in the Eclipse claim small bunches of high-grade free-gold ores are encountered, which is an indication that they are in the neighborhood of the Eclipse ore. If this is correct, the mill will be kept in operation, as there is ore in sight to keep it running for months.

The Logan Co., operating on Cherry creek, have a shaft down 80 feet and have taken out thirty tons of high-grade ore.

At the Lion group thirty-five men are at work developing. There is a mill on the property and it will soon start up.

The Bradshaws report a strike in the Gray Eagle mine. A crosscut exposes ore 7 feet wide, 6 feet of which gives an assay value of \$30 a ton gold, and 1 foot \$75 a ton gold. The strike was made in a crosscut from a tunnel at a depth of 300 feet. The ore body is exposed for 700 feet. The mill near the property will be started up as soon as there is sufficient water. G. P. Harrington is general manager, T. Lee superintendent.

New York reports the purchase of the Congress gold properties, Congress, by the Development Co. of America: consideration not announced.

YUMA COUNTY.

At Quartzsite the Valenzuela has resumed.

CALIFORNIA.

ALAMEDA COUNTY.

The Yellow Metal M. & R. Co. has incorporated in Oakland; L. Cooper, H.

Lancaster, A. McGrach, G. H. Bennett, J. E. Shelter.

AMADOR COUNTY.

At the Kennedy mine the mill is crushing ore from the 2400 level. Superintendent Truscott at the South Eureka mine has the shaft below the 2300-foot level. The 20-stamp mill is in operation. At the Wildman, Superintendent Ross expects to soon resume sinking in the Emerson shaft, now down 600 feet.

At the Central Eureka mine, Superintendent Thomas, at a depth of 2000 feet has 10 feet ore.

The Jackson Ledger says the Sargent mine owners who contracted to sink 300 feet at \$11.50 per foot threw up their contract. They got down about half the distance and made fair wages most of the time, until the flow of water became so strong they could not control it. They asked the company to put in a pump to handle the water, which the company did not do. So the men quit.

The Moore mine is sold to W. A. Nevills for \$70,250.

At the Del Monte, during ten days of power drilling in August, 23 feet of tunnel was driven at a total cost, including labor, powder, fuse, candles, caps, water, coal and oil, of \$294.40, or \$12.80 per foot. During twenty-one days of hand drilling in August, 21 feet of tunnel was driven, at a total cost of \$254.30, or \$12.10 per foot. Amount of upraise driven in August, from old tunnel level, 14 feet, at a total cost of \$53.65, or \$3.85 per foot. Total length of upraise from lower stulls on September 5 was 37 feet. Total expense for construction, including labor on buildings, laying and moving pipe, during August was \$283.05. The total length of crosscut tunnel driven on September 1 was 289 feet. Assays show a value in free gold of about \$2 at this point, indicating that the ledge carries values, and will probably develop well on drifting. Water supply was cut off August 10, and has since been turned into the ditch in sufficient quantities to resume power drilling.

BUTTE COUNTY.

The Register says three new dredgers are being built near Oroville. The Leggett & Wilcox No. 2 is being constructed near the Faul place; the Butte near the Boston machine shop and the American 2 miles south of town. The Cherokee dredger has put on three crews and is running day and night.

The Western Power Co. has incorporated at Oroville; T. L. Neal, A. L. Stephens, B. D. Neighbors, T. H. Hastings, W. Henderson. This company has acquired rights on the headwaters of the North Fork and proposes to establish an electrical power plant. The company proposes to use the Big Bend tunnel which was dug for the purpose of turning a large portion of the bed of the North Fork of the Feather river from its natural channel, with a view of mining therein. The venture did not prove a success from a mining point of view, but the value of the property for power purposes in the generating of electricity has of late attracted attention. Arrangement was begun some months ago for the erection of a large power plant and the transmission of electricity to San Francisco.

CALAVERAS COUNTY.

At the Campo Seco M. Co.'s property the double-compartment shaft is 80 feet in depth, crosscuts east and west from the 60-foot level being in 50 feet in either direction. A 12 H. P. gasoline engine, capable of hoisting from a depth of 500 feet, furnishes power for raising rock and water and also drives the air compressor which supplies air for operating the machine drill. The engineer empties the bucket when hoisting either water or ore. When bringing rock to the surface the bucket is hoisted several feet above the ground, a hinged platform is dropped into place, the bucket is lowered upon it, and by pulling the rope the engineer tips the platform, dumping the rock into a car. In hoisting water the bucket goes to the top of the gallow's-frame and the engineer works a lever that swings a wooden trough beneath it, into which the water is emptied.

The Crystal mine has put up a gallow's-frame and timbered the mine to a depth of 100 feet.

The Record says a new 120-stamp mill will be put up at the Royal mine.

CONTRA COSTA COUNTY.

The National Paraffine well is down 1700 feet and it is expected to soon strike the oil sand.

FRESNO COUNTY.

The property of the Fresno Copper Co. is 18 miles northeast of Fresno. A two-compartment shaft is being sunk, one for the pumps, the other as a manway. The company will put in a 100 H. P. double-reel engine.

In Los Angeles Judge Welborn, in the United States Circuit Court, decides that in the controversy between the Copper

King Co., Ltd., and the Wabash M. Co. it is permissible for the parties involved to arrange for three expert mining men or engineers to visit the mines in question and make a report to the court of the actual condition and of the damage, if any.

HUMBOLDT COUNTY.

The Wild Goose Oil Co. abandoned its well at over 1000 feet, owing to a lost string of tools. The rig has been moved and a new well will be drilled.

KERN COUNTY.

Bakersfield reports that the effort to develop oil north of Poso creek has been abandoned. The Defiance Mineral, which has been operating for the past two years on Section 14, 23-27, is pulling the casing in its third well with the intention of quitting work. This well is down 1600 feet, and two other wells were sunk by the company to a depth of 1200 and 1400 feet, respectively, but without result.

MENDOCINO COUNTY.

A well at Point Arena is drilled over 530 feet, with oil and gas indications.

MONO COUNTY.

Near Bodie, W. A. L. Loose has relocated a claim near the Syndicate which has a 600-foot tunnel.

The Oxford Beta T. & M. Co., Aurora, has leased an assessment of 1 cent per share.

NEVADA COUNTY.

Jas. D. Hague, president North Star Mines Co. has made a report to the stockholders, in which among other things he says within the past few months the productive capacity of the mine has increased by a body of ore developed in the eastern portion of the old North Star workings, between the 1100-foot and 1900-foot levels, where a winze has been sunk from the 1100 about 350-feet downward, on the dip of the vein following continuous ore of very profitable quality, while the same rich ore body has been found, about 100 feet or more still deeper, by a long drift from the 1900-foot station of the main incline. Between January 1st and September 1st there have been mined from this newly developed ore body 3678 tons of ore, yielding about \$146,000, at a cost for all expenses of operation and development in these workings of \$40,000, an operating profit of \$106,000, or about \$29 per ton. The operating receipts of August were better than the stated averages, showing an output of 620 tons of ore, a product of about \$47,000, or over \$75 per ton, costs of about \$8000, or \$13 per ton, and a profit of \$39,000, or over \$62 per ton.

The operating profit from this source, about \$106,000, has been sufficient to pay all costs of development in the workings at the deep shaft, with all other incidental expenses of every sort, during the past eight months, and to leave a surplus of about \$35,000.

The superintendent reports that in the month of June the water hoisted from the main station, about 1600 feet vertically below the surface, averaged about 400 gallons per minute and amounted to 100 tons per hour, or 2400 tons per day, all raised to the tunnel level, more than 1400 feet high, but despite this a considerable amount of development work has been done.

The main raise, following the vein upward from the Central Shaft bottom, on the 4000-foot level, has been advanced 400 feet, showing a well-defined vein of fairly profitable quality all the way. Since January 1st, 7583 tons of ore have been raised and sent to the mill, producing \$54,511.65, or \$7.139 per ton. The clean quartz, mined by itself would probably average between \$12 and \$15 per ton, but it has been unavoidably mixed with so much waste in mining under existing conditions that the yield of all material crushed has but little exceeded \$7 per ton, sufficient to pay production expenses. The 3900-foot level has been driven westward more than 400 feet from the deep shaft, in the expectation of finding the continuation in depth of the main ore body of the upper workings, and within the past two months this drift has disclosed a very well-formed vein of good ore, which now promises to realize the above mentioned expectation. A sample of thirty-two tons of ore, broken along 60 or 70 feet of this drift, has been crushed lately as a test, yielding about \$17.50 per ton, about the recorded average yield of all the ore produced in the upper workings, amounting to more than 300,000 tons, yielding between five and six million dollars. This recent development Mr. Hague considers significant, giving assurance of productive and profitable operation of the mine for many years to come. He does not think it probable that water will permanently hinder mining operations in these deeper workings. Persistent pumping should ultimately check the excessive flow, which, under normal conditions, can easily be dealt with by pumps. The pumping capacity of the

deep shaft is now being doubled and it is probable that within a short time the difficulties existing hitherto will be wholly overcome.

Suit is begun in the Superior Court by the Pennsylvania M. Co. against the stockholders of the Grass Valley Exploration Co., or W. Y. O. D. Co., for \$525,000, in addition to interest and attorneys' fees, to determine a point which Judge Morrow did not touch upon in his recent decision in which the Pennsylvania Co. was awarded a verdict. At that time Judge Morrow intimated that he would appoint a commission to award the amount of damages. Shortly thereafter it was an open report that this portion of the original suit would be settled by the Exploration Co. turning over its mining property to the plaintiff in lieu of cash. A meeting to discuss this phase of the case was held in San Francisco on the 20th and continued until the 22d, when the negotiations fell through. The suit begun is the result. The complaint alleges that the defendant company within the past three years had removed 35,000 tons of valuable ore, estimated to be worth \$525,000, from the mill and 900 level of the Pennsylvania ledge. Should the plaintiff be awarded the final decision—for the case will be carried through all the higher courts if the Pennsylvania Co. wins in the Superior Court—the loss may fall on the stockholders of the Exploration Co. in proportion to the amount of stock each holds.

A two-fifths interest in the New Independence mine, near Graniteville, has been bought by J. Goodwin of You Bet. A new 10-stamp mill is building. C. M. Root continues as superintendent.

For the Union Hill mine Superintendent Creller has bought a 10-stamp mill formerly in use at the Engish Mountain mine near Graniteville. The mine is being unwatered.

The new 5-stamp mill of the Puscheck mine at Chicago Park is about finished. A new 120 H. P. compressor will be put in and the mine unwatered.

PLACER COUNTY.

At the Azalea mine, Blue canyon, 300 feet of main tunnel will be made this season. During the past sixty days the company has expended \$1480.09 in development work.

At the lower Forest Hill divide Russell & Burrage have started a new tunnel to tap 7 miles of the tunnel on the main divide at Peckham hill, 91 feet below the old Rough & Ready tunnel. The new is in 245 feet. The machinery comprises a steam compressor, blower, machine drills and a forty light power electric plant.

The Turkey Hill mine is sold at sheriff's sale for \$8193. The plaintiffs, Pereira vs. Hamilton, secured a judgment on labor liens. The property was bid in by A. K. Robinson for plaintiffs.

The Vore mine at Weimar will be reopened next season. The Crater mine, near Ophir, will be put in operation; also the Gold Blossom.

RIVERSIDE COUNTY.

The Ramona G. M. & M. Co. has incorporated at Riverside; C. H. Briggs, E. and R. H. Beall, A. A. Caldwell, D. F. Body, W. F. Jordan, W. F. Walke.

SAN BERNARDINO COUNTY.

San Bernardino reports the sale of the Iron Chief, on the desert directly east of Mount San Bernardino, for \$20,000, to J. F. Cullin of Pittsburgh, Pa.

Manager Thompson, at Vanderbilt, now has twenty-nine men at work on the Gold Bronze and St. George mines.

F. O. Wilkinson, who represents the Hearst estate, has received at Manvel (or Barnwell, as it is now called) 13,000 pounds of machinery to be placed on the Green Monster claim. A reduction plant will be placed on the property.

L. M. Gregory, president Giant Ledge G. & C. Co. at Manvel, claims to have smelting ore in sight. Water has been developed sufficiently in New York canyon at the company's millsite location.

The reports of Prof. G. E. Bailey of the California State Mining Bureau have attracted renewed attention to the deposits of niter near Death valley and a rush is reported to that desolate region. Expeditions are leaving Daggett, Borate, Randsburg and Mohave for the valley. Three hundred men are reported at Ballarat for information as to which portion of the desert is the best. The deposits are 130 to 145 miles from Daggett, 110 to 130 miles from Randsburg and 45 to 70 miles from Ballarat. They extend over a territory 25 miles long and 15 miles wide. No water can be found in the vicinity of the niter, Furnace creek, 35 miles distant, being the nearest point to the niter beds at which water can be obtained. Shafts have been sunk in the niter beds from 5 to 45 feet without finding any moisture. These shafts are reported in niter from the surface down. The most convenient point to the deposits is Ballarat, from which water must be carried. By way of

Ballarat the distance to the new Tarapaca is between 125 and 130 miles from the railroad, the terminus of the nearest line being Johannesburg.

SAN DIEGO COUNTY.

At Julian the Oro Blanco M. Co.'s tunnel is in 1100 feet and will be pushed this winter.

J. A. Wauchope, manager Noble mines, Pine Valley, is looking for men to be employed there.

SAN LUIS OBISPO COUNTY.

W. H. Wright is manager Pine Mt. and Oceanic quicksilver mines. In the early days of the local quicksilver excitement \$200,000 was expended on the Pine Mt. property. The company has felt its way along without undue expenditure of money. The usual retort was erected and ore from the old tunnels worked as long as profitable. The desired object was to discover the main lode. After sinking shafts and driving tunnels at points where good outcroppings appeared, a tunnel was started 300 feet below the summit of the ridge. This tunnel now reaches into the mountain 1400 feet. The owners will next spring put in a reduction plant, furnace, crushers, tramways and machinery for hauling ore. The company has its own sawmill.

SHASTA COUNTY.

W. F. Mitchell, manager of the Shasta G. & C. Co., tells the Tribune of Salt Lake, Utah, where he now is, that at De Lamar's Bully Hill mines and smelter at intervals bullion of the value of \$500,000 is stacked up at the plant. A new strike recently made in unexplored territory through a new opening from the surface discloses a remarkable ore body, some of the ore containing a valuation of \$5000 per ton in silver and gold. Mr. Mitchell says the output of three months at the mine and smelter was such as to reimburse De Lamar for all he was out in the acquisition of the group, for which he paid \$265,000.

Forty-three mining location notices were filed with the Shasta county recorder in September.

J. J. Chambers will put a smelter on the Afterthought property.

The break in stocks makes Trinity quoted at 11.

The McCloud River Electric Power Co. has let a contract for preparatory work on a 15,000 H. P. plant to the San Francisco Construction Co. and G. W. Elder of San Francisco.

H. H. Noble of the Northern California Power Co. says he will build a third power plant on Pitt river to develop about 200,000 H. P., the power to be transmitted to San Francisco 260 miles.

At Keswick the smelter is running full capacity. At the beginning of the year two furnaces were in operation, but a third one was started last week. There is ore in storage to keep a fourth going. Two of the three briquetting machines are in constant operation.

The Salt Lake Tribune of the 28th ult., says \$20,000 paid to A. H. Tarbet relinquished his property rights in the Afterthought group of mines, the property upon the payment of \$150,000 to pass to W. F. Snyder of Salt Lake City. The Western Exploration Co., of which Mr. Snyder is president and manager, has an option on the Balakala group in the same locality, and the purchase of the Afterthought indicates the option on the neighboring proposition, which involves \$650,000, will be exercised. A condition of the deal requires continuous work until the final payment on the Afterthought is discharged. The property has already been extensively opened up with good results.

According to local reports, the Afterthought copper mine, 20 miles from Redding, is bought by the Great Western G. Co. from the Tarbet Syndicate of Salt Lake City, Utah, for \$150,000—\$20,000 cash, the remaining \$130,000 in one year.

SIERRA COUNTY.

Work is resumed on the Mabel Mertz mine, above Alleghany, by H. McCormick.

R. Phelan is operating mining property in Slug canyon and has a bond on the Butte Saddle property, Sierra City, fourteen men being employed there.

Parrington, McCree & Bacon of Salt Lake City, Utah, have been examining the Mexican ledge on the South Fork, bonded to a company represented by H. M. Bacon.

SISKIYOU COUNTY.

John C. Young of Baker City, Or., is interested in the Hummer mine, East Fork district, 6 miles from Callabans. The capping of the Hummer is gossan rock, the vein below a quartz with iron sulphides, but no copper. The workings are shafts and crosscuts. Ore near the porphyry contact gives a return of 10% copper.

The Phillips Arrastra M. Co. at Seiad has tunneled over 80 feet into the mine,

which shows ore the entire distance. They will sink a shaft on the vein, which is 5 feet across. The company has a quartz mill on Seiad creek. The ore has yielded \$24 per ton.

TUOLUMNE COUNTY.

(Special Correspondence).—The Mack Con. G. M. Co. has bonded all its property here to L. H. Carver of San Francisco. There is an equipment consisting of a 10-stamp mill, compressor, holsts, boilers and engines, pumps, tools. Considerable development work has been done on a vein averaging 5 feet in width, disclosing the existence of two ore bodies that carry good values. The Mack shaft is down 400 feet and the Wooten 300 feet, both of which are double compartment, sunk on the vein at an inclination of 35°. Mr. Carver will direct future development.

Big Oak Flat, Sept. 25.

The Jamestown Magnet says at the Eagle-Shawmut mine ninety men are kept to work during the shut down. The chlorination plant is being run to its full capacity. Removing the forty stamps from the old mill to the new is about completed and in a few weeks time 100 stamps will be dropping regularly at the Shawmut mill.

Near Tuttle town the Tarantula mine is being dismantled, the machinery to be removed to the Last Chance mine at Angels.

The Santa Ysabel G. M. Co. of Boston, at Quartz, will reorganize with a capital stock of \$2,000,000; present capital, \$750,000.

At Confidence S. A. Addison will add to the cyanide plant so as to enable it to run all winter. Fifteen more men will be required.

The Sonora Union-Democrat says the forty stamps from the old mill are being removed and set in place alongside the sixty in the new building at the Eagle-Shawmut mine. The 100 stamps will be dropping before the close of October.

The cyanide plant at the Mt. Jefferson is in operation and gives satisfaction. Heretofore the sulphurets were handled at a great cost, which was only possible owing to their rich character. In shipping them away for treatment it cost the company \$19.50 for every ton treated, while now with the mine plant a ton can be treated for \$2.50—a saving of \$17 on the ton.

W. Tucker, superintendent Stockton Gravel M. Co. near Jupiter, has a new saw mill, capacity 10,000 feet. A crosscut saw has been added to the equipment. A third pipe line is being put in and another monitor will be installed. A blast will be set off in November in the old works—two tons black powder in one shot.

Superintendent J. H. Burkhart will put in a new 10-stamp mill at the Mt. Hood.

Near Carters, E. C. Holmes has bonded the Great Wonder and New Century mines at \$10,000.

TRINITY COUNTY.

The Journal reports that, on Bullychoop mountain, the Bullychoop M. Co. has completed its new works. The towers for the gravity tramway are in position and ready for equipment. The mill and mill buildings will be completed next week. The company expects to start up the mine Oct. 10th. Twenty-five men are employed, to be increased to sixty when the mill is ready to crush ore. The ledge is over 20 feet in width, of low grade and well mineralized. During the year before the mill was moved the mine paid dividends. The removal of the mill to its present position and other improvements made will facilitate the working of the mine and will cheapen the cost. The tramway alone will effect a saving of 75 cents a ton in handling rock. W. B. Gester is superintendent and A. P. Anderson foreman.

The Texas Jack mine, Edmonds & Subbett owners, has a stamp mill.

At the Oriole mine, owned by Collins Bros. & Paulsen, the ore is crushed in a cannon ball mill.

The Enterprise mine at East Fork is developed by 3500 feet of levels, dips and winzes. The pay shoot in the Lone Jack is 30 inches wide—\$10 to the ton in gold. The pay shoot in the Enterprise averages \$50 in gold per ton. The property has a 10-stamp mill and a tramway uniting the mine and mill. The mill run for July was seventy-four tons and the result a gold bar worth \$839.63. In August twenty-one tons were run through the mill and a gold bar worth \$613.99 was the result. A new pump and hoist are to be installed. The Spokane purchasers are Hays & Stevens.

COLORADO.

BOULDER COUNTY.

The Boulder County mine, at Cardnal, has run steadily since June, 1901. Twenty men are employed, mostly on development work, doing little stoping. The mill is treating 600 tons a month—a 30-stamp

rapid drop mill. The management has postponed enlargement of the mill until spring; will then double its capacity.

CHAFFEE COUNTY.

A deal has been made by the Colorado Securities Co. by which Missouri men acquire ninety-two acres mineral land in Granite district.

CLEAR CREEK COUNTY.

Idaho Springs reports that Judge Clifford of Chicago on petition of C. E. Dickson of Jacksonville, Ill., has appointed the Merchants' Loan & Trust Co. as receiver for the Con. Stanley M. Co., owning the Stanley property at that place.

Georgetown reports the Vidler tunnel attracting attention. It has cut a vein 225 feet from the entrance sealed with streaks of galena and gray copper. The tunnel, within 7000 feet, will cut through the Continental divide.

The Empire Tunnel Co. has the tunnel in 1400 feet. Last week a vein was cut carrying \$8.80 gold per ton. The company owns the Gold Dirt property and has thirty men at work repairing, altering and extending the workings. Milling ore is blocked out, through which run streaks of milling ore.

Shipments from the Gold Fissure average 1000 tons per month, being the usual output. This ore is shipped to the Carpenter smelter at Golden and averages about \$11 per ton. Thirty men are employed.

On Bellvue Mt. the Poorman group of twelve claims is being worked by an Eastern company, A. I. Bean superintendent, who is cutting a station 190 feet in the tunnel for a 22 H. P. gasoline hoist. The shaft will be sunk to a depth of 300 feet. The company will start a tunnel from the Clear creek side, near Dumont, driving on the vein, and in a distance of 1200 feet will attain a depth of 800 feet on the Poorman vein.

The mills of Idaho Springs district are in operation to their full capacity. The Jackson mill is running on ore from the Old Town mine, Russell Gulch; the Newton mill on ore from the Gem vein, Newhouse tunnel, and Main Trunk, Kansas-Burroughs and Gower Syndicate of Gilpin county; the Bonieta mill on ore from the Quito and Fraction mines and the Eagle Bird mine at Yankee Hill; the Bertha mill has ore from the Lillian, Waltham and Old Town mines in Russell district; the Gold Cord mill on ore from the Newton and General Thomas mines; it is operated under lease by the Little Mattie Co., who are also operating the Mattie mill at full capacity. At the Wilkie mill ore from the Boodle mine, Gilpin county, and the Seaton, Silver Age and Sun and Moon mines is being crushed.

FREMONT COUNTY.

J. Stovekin, manager Cripple Creek beam mill at Florence, talks of a new mill between Colorado Springs and Cripple Creek, on the line of the Short Line Railroad. He has applied for a patent for 160 acres of land and says he will erect a mill that will be able to treat \$5 ore at a profit.

GILPIN COUNTY.

Superintendent J. Neidmeyer has seventy-five men at the Gunnell and Grand Army mines; average daily shipments, eight tons, most of which goes to the mills of the company at Black Hawk.

The Boston & Denver Con. M. & M. Co. afford employment to fifty men, all of whom are working on tribute account. About 100 tons of ore are daily taken out and treated in the big mill, which is also handling some custom ore.

Operations are resumed at the P. K. and Bant mines, east of Black Hawk, under the management of G. D. Johnstone.

GUNNISON COUNTY.

The Goodhope mine, at Vulcan, is in more ore. There are five levels running from the main shaft, all in ore. Shipments have been small, averaging \$15,000 per month. The shipping ore from the Goodhope is running \$200 per ton.

HINSDALE COUNTY.

J. D. Brown is superintendent California mine, below Henson. An air compressor is in; a 6-foot vein carries silver, lead and from \$2 to \$5 per ton gold. He expects to build a mill next spring.

Near Bonanza, J. D. Baldwin is superintendent of the Rawley, one of the largest producers in camp. A concentrating plant is going in and will be in running order May 1, 1903.

The Juretta is working two shifts. Superintendent Ashley has assays as high as 250 ounces silver.

Manager J. MacMillan of the Little Sister M. Co. has a group of claims in the heart of Bonanza's mineral belt.

LAKE COUNTY.

Near Leadville the Moyer is shipping 250 tons of ore daily. This has to be hand-sorted before it goes to the smelter. The ore is varied, containing iron, zinc, copper

and lead, some straight iron sulphide which goes straight to the cars, the balance is sorted out by miners. The lessees of the Moyer are putting down a new shaft that will reach the lower contact at a depth of 1000 feet.

There is now coming out of the Yak tunnel 200 tons per day of sulphide ore and zinc, including the tonnage of the company and that of the lessees.

A car of ore from the Washington mine of the Washington G. M. Co. at Granite, near Leadville, returned 6.38 ounces gold and 4.05 ounces silver, for the high grade, and 2.18 ounces gold and 1.02 ounce silver for the medium-grade ore. The consignment was made up of ore extracted from the 118 and 175-foot levels from the high-grade streaks in big vein, which is 25 feet wide. Leaving out the rich streaks the vein averages \$7 to the ton.

Manager Guth of the Banker mine has returned to Leadville from New York to resume work on the mine, sink the shaft and do prospect work in the low-grade ore bodies. He is considering the erection of a milling plant to treat this low-grade ore.

MESA COUNTY.

A uranium plant of ten tons capacity per day is to be erected at Grand Junction by C. E. Carpenter of Cincinnati.

MINERAL COUNTY.

Ore shipments from Creede during August were the largest of any month this year, amounting to over 7000 tons. Up to Sept. 20 they aggregated 4764 tons, requiring 238 cars for conveyance to market.

OURAY COUNTY.

In the Tabasco mines, Burrows park, the main tunnel, 1265 feet in length, runs alongside the vein, going clear through the mountain. The vein has been cross-cut in ten places along the tunnel. Its width is from 7 to 30 feet, the average width being about 20 feet. A number of mill runs from these cuts give an average of \$11.20 per ton. The mill, located 2 miles from the mine, is ready to start, but the connecting tramway is not quite finished. The capacity of the mill is about 100 tons per day. When in full operation, the company expects to clear \$1000 a day over all expenses. The Iselde mine is operated by the Dupre Co. The ore body is 2 to 6 feet wide; the output is half a carload daily. Some ore comes out of the mine running 100 ounces gold to the ton.

The Brooklyn mine, near Chattanooga, is to have a 10-stamp mill. The low-grade ore will be handled on the ground, the richer material going to the Durango smelter. About three cars are shipped each week, containing three ounces gold and some silver.

Superintendent G. T. Bradley, near Ouray, has the Pickett mine, Poughkeepsie gulch, in preparation.

The Des Ouray Con. has incorporated in Montrose to work the Republican, Virginia Bell and about twenty-five other claims on Mineral creek.

PUEBLO COUNTY.

At Pueblo the Philadelphia smelter has made an additional order for 120 tons of Ilmorock per day from the quarries west of the city.

The oil refinery at Overton will be dismantled and the machinery taken to Boulder, where it will be used in an oil refinery to be established at that place. The refinery has not been used for several years. It was built to refine the oil from the Florence field, which was conveyed there by an immense pipe line. The original cost of the plant was several hundred thousand dollars.

Pueblo reports A. Raht of the American S. & R. Co. is in that city with S. Gugenheim. It is understood by the local management of the American smelter that the visit is to make plans by which a new smelter will be erected on a tract near by.

SAN JUAN COUNTY.

The Silverton Miner says an effort is being made to consolidate about a dozen of the best properties at Red mountain into one large company. Some Eastern men are on the ground trying to buy the different mines desired, and if successful they will be extensively developed.

The mine operators of San Juan county have organized a miners' employment agency where good practical miners can secure employment in the properties represented in the membership of the association.

The sale is reported of the Titusville group on Kendall mountain to the Guggenheim Exploration Co. for \$500,000. The property was owned by T. H. Kane and W. J. Kane and the Eastern stockholders of the Hercules M. Co.

Near Silverton, M. & W. Moyle have transferred the Gladstone, on Sultan mountain, to the Silverton M. Co. for \$20,000.

The Good Hope mine, Bear creek, reports a strike of tellurium.

SAN MIGUEL COUNTY.

The Smuggler-Union mills at Pandora are daily crushing 500 tons of ore. The company is employing 450 men at the various mines and mills; eighty men are employed at the Contention mine in Bear Creek basin; the long tramway from the mine to the mills runs steadily. The company is daily shipping from three to four cars of concentrates; the principal gold values are saved on the plates by amalgamation.

The stub tram, from the upper terminal of the long tramway to the mouth of the tunnel at the Liberty mine is completed and working. When buckets loaded with powder, timber or other mining material reach the upper terminal they are shifted on the stub and the supplies delivered direct to the mine. The mill is running at full capacity and both the canvas table and cyanide plants are treating tailings. Three hundred tons of ore are sent to the mill every twenty-four hours, and an average of seven cars of concentrates are sent to the smelter per week.

SUMMIT COUNTY.

The Pennsylvania property, Peru district, near Argentine, is sold to the Ohio Mines Syndicate, known as the Plata-y-Oro M. Co. F. Graham has managed the property, employing twenty-five men.

TELLER COUNTY.

The men who staked the late W. S. Stratton are now being heard from in great numbers, being even more numerous than those who staked the late Jno. W. Mackay.

A surface strike on the Nil Desperandum of the Gould Con. Co. shows \$100 ore in a 12-foot shaft.

Beginning Oct. 1, the following are the freight rates between Colorado Springs and the Cripple Creek district:

Ores and concentrates (minimum weight 24,000 pounds per car), actual value not exceeding \$30 per ton of 2000 pounds.....	\$2 50
Actual value over \$30 per ton, but not exceeding \$100 per ton of 2000 pounds.....	3 50
Actual value over \$100 per ton, but not exceeding \$150 per ton of 2000 pounds.....	4 50
Actual value over \$150, but not exceeding \$200 per ton of 2000 pounds.....	5 50
Actual value over \$200, but not exceeding \$300 per ton of 2000 pounds.....	6 50
Actual value over \$300 per ton of 2000 pounds if released to that figure and so specified on bill of lading.....	6 50
Actual value over \$300 per ton of 2000 pounds and not released to that figure.....	6 50+
One per cent of value in excess of \$300 per ton	
When smelters will not issue and furnish to delivering agent a certificate showing actual value, and where the ore is not released in accordance with second preceding clause.....	9 50
Actual values not exceeding \$20 per ton of 2000 pounds.....	1 00
Actual value over \$20, but not exceeding \$25 per ton of 2000 pounds.....	1 25
Actual value over \$25, but not exceeding \$30 per ton of 2000 pounds.....	1 50
Actual value over \$30, but not exceeding \$40 per ton of 2000 pounds.....	2 00
Actual value over \$40 per ton of 2000 pounds.....	2 50

Ores and concentrates, less than carloads, shipments will be charged for at fourth-class rates per 100 pounds. All charges must be prepaid.

The Cripple Creek M. Co. has stopped sinking at the 1100-foot point and is cutting a station at that level of the Hull City placer. The leasing company is gradually decreasing shipments. Twenty-five tons a day is now being produced, chiefly from the 1000-foot level. The ore is averaging \$50 per ton. A connection is being made between the Glorietta workings and the main shaft at a depth of 785 feet in the latter workings.

The continuation of the Anaconda ore shoot has been opened 10 feet below the tunnel level, in block 42, by E. Peterson. The ore shoot is 8 feet in width and samples \$30 to the ton.

H. L. Coe is manager Squaw Mountain M. & M. Co. and has a contract to operate their April Fool claim from the 660-foot level of the Goconda mine. The vein matter averages \$11.20 to the ton in gold.

The new double hoist on the Zenobia is in operation. The 200, 300, 400 and 500-foot levels are being extended to exploit the territory, and sinking has been resumed and will be continued to a depth of 1400 feet.

The Mary McKinney mine pulled its pumps last week, allowing the sixth level workings to be submerged. This action is taken in view of the fact that it will be several months before the new 1500-gallon-a-minute pump arrives, so that it is inadvisable to keep pumping 300 gallons a minute when there is nothing being done

in this level. The shaft was sunk to 600 feet some time ago and a station cut, which was later enlarged to accommodate the new big pump when it should arrive. The pump may not be received before Jan. 1, so that there would elapse three months of needless pumping, and the object which would be gained would be nothing more than keeping the station at 600 feet clear of water.

Cripple Creek says work on a big scale is to be resumed on the Newell tunnel, Grouse mountain, fifty men to exploit the vast ground. The work so far performed has cost \$100,000. Manager Newell says he is prepared to go ahead and spend another \$100,000, if necessary. The main tunnel is in 1400 feet. A lateral has been extended north a distance of 1100 feet, and from it has been sunk a winze to the depth of 110 feet. It is the intention to deepen the winze down to the 500-foot point below the tunnel.

Eight of the fifteen companies owning property on Guyot hill are under operation. There are employed on the mountain 181 men, who receive on an average of \$3.32 per day, making a daily payroll for the hill of \$600. The largest force is employed by the Mary McKinney Co., it having 120 men on its payroll, who average \$3.50 per day.

What is locally believed to be the continuation of the Anaconda ore shoot has been opened 10 feet below the tunnel level on block 42 of the Anaconda estate.

Thirty men are sorting and washing the dump of the Elktion mine. Considerable low-grade ore is being shipped weekly from the dump; most of it will average \$15 to the ton.

A proposition that receives attention from mining men on the watersituation of the Cripple Creek district is driving a tunnel from below Grouse mountain toward the El Paso mine, connecting with the 600-foot level in that property.

London dispatches of the 1st say that the Venture Corporation, promoter of the Independence mine at Cripple Creek, confirms the report from Colorado Springs that it is preparing to bring suit for \$5,000,000 damages against the estate of W. S. Stratton. Mr. Baker, managing director of the Venture Corporation, is now in the United States and is said to be preparing the necessary evidence.

Work has been resumed on all of the properties owned by the Stratton's Cripple Creek M. & D. Co. throughout the camp. Superintendent Johnson is in charge.

In Cripple Creek district, on Battle mountain, there are seventeen properties under operation, either on company account or by lessee; employed by them is a total of 1682 men. The average pay for each man is \$3.50 per day—\$176,400 a month. The territory of Battle mountain is owned by a total of twenty-eight companies and of that number about two-thirds are under operation. The Portland has 490 employees; Stratton's Independence has 400 men; the Ajax 200 men; the Gold Coin 150 men; the Granite 92 men; the Strong 80 men; the Ophir Co. 50 men; the Modoc Co. 45 men; it is expected that that number will be doubled when it starts work through the new shaft. Gray & Kurtz, operating the Monument, have twenty-five men; on the St. Patrick property, seventeen men; the Sunset-Eclipse, twelve men; ten on the Mary Cashen; on the Monument, Dillon, Coriolanus and Mary Alice, twenty men.

The men on the Portland are breaking about 9000 tons of ore a month. On the Ajax, 3000 tons of ore is broken and shipped each month. On Stratton's Independence a tonnage of 300 tons of ore a day is shipped. The Gold Coin is daily averaging sixty tons of ore. Gray & Kurtz, operating the Monument, are shipping thirty tons of ore a day that will average \$40 to the ton. The Strong averages three broad gauge carloads of ore each day. The Modoc is not shipping heavily at present. A good ore body is at the depth of 425 feet on the Mary Cashen. The Mohican is making regular shipments. The Ophir Co. shaft is down 600 feet and to be sent to the 1000-foot point.

The public dividends paid amount to \$10,940,524. Of this the Portland distributed \$4,267,080; Stratton's Independence, \$3,558,000; the Gold Coin paid \$1,160,000; the Strong, \$1,615,000; the Modoc, \$310,000; the Monument, \$30,444.

Men familiar with the underground workings estimate that there is enough ore in sight to mine for the next five or six years.

IDAHO.

ADA COUNTY.

J. W. Burton, manager Gold Eagle mine, Boise, Idaho, continues the incline to the 300-foot level, 80 feet below the present sump at the bottom of which he reports ore of fine quality.

CUSTER COUNTY.

The dredger at Stanley is being repaired.

The management says the boat will have to be enlarged before dredging operations can be resumed.

A bond has been given on the Mountain Girl group of mines to W. J. Bryan, who projects a 20-stamp mill.

Grading for the new mill at the Valley Creek mine is finished.

There was a recent trial run of one of the smelting furnaces at Mackay. The equipment may have to be changed. Only one stack was blown in. The hauling capacity will therefore have to be increased. The two furnaces have a daily capacity of 1000 tons ore. Automatic bins may have to be put in.

SHOSHONE COUNTY.

The following reduced rates for the Cœur d'Alenes on lead concentrates and ore, graded on previous scale of values, took effect Sept. 22, 1902: Denver & Pueblo, \$8, \$10 and \$12 per ton; Leadville, \$7, \$9 and \$11; East Helena, \$2.75, \$4 and \$6.

The Marietta G. M. Co. has secured control of the Atlas group of claims in the Cœur d'Alenes. The company paid \$10,000 for the property and announces that work will be started at once to develop the property.

The town of Delta, one of the oldest mining camps in the Cœur d'Alenes, will soon be no more. Every strike on the town site is to be torn down, burned or moved away. The town site has been purchased by the Beaver Creek G. M. Co., which will dredge that portion of the creek.

After four years of litigation the Skookum mine case has been settled. K. J. Hanley, plaintiff, has been awarded damages to the extent of \$265,241 by the master in chancery at Spokane. The Skookum mine is in the vicinity of Wardner. The defendant was the Empire-State Idaho M. Co. The court held that during the four years of litigation the defendants had extracted ores from the Skookum grounds to the extent of \$4,354,957.

Mullan reports a copper strike on the property of the Park C. & G. M. Co., Steven's peak, 5 miles south of there. The owners of the property say the vein is 10 feet wide. It is said the ore will carry 26% copper. The directors of the company are Samuel, Burke, Gies and Bernard, all of Wallace.

Wallace says the Northwestern S. & M. plant, 1 mile west of there, has been sold by the Mine Owners' Association to the American S. & R. Co., to be turned over Oct. 1. The plant has been established twelve years. All the ore produced from the mines of this district is sampled at the plant before it is shipped to the refinery. Until May last the plant was owned by Potter & Whitlow, when it was purchased by the Association.

MICHIGAN.

HOUGHTON COUNTY.

Houghton reports the Adventure mill in commission, with one head of stamps in operation. One feature of the new mill is the use of two Huntington mills for the regrounding of raggings or coarse sands. From these mills the material goes to Overstrom tables for treatment. The pump is a four-section Reidler compound, the first to be used at a Lake mill.

Calumet estimates that about 4,000,000 tons of ore will have been shipped from the port of Superior by the close of the present season. All the copper ore ports have been heavy shippers and ore carriers are now waiting at some of the lower ports. The indications are that the rush will continue up to the close of navigation. It is estimated that the shipments for the first half of September will be equal to those of the same period of last year, when a record was made. It is said that the Calumet & Hecla mine will have shipped enough mineral by the close of navigation to keep its smelters at Buffalo in operation until next season. The indications are now that, owing to the increased production, next season will see the heaviest movement of copper ever recorded from lake ports.

MONTANA.

BEAVERHEAD COUNTY.

J. M. Humes of Butte has charge of development work in the placers of French gulch.

FERGUS COUNTY.

Murphy Bros. are operating a mine in the Cone Butte district, close to the Golden Eagle group, a cyanide proposition.

Hoisting machinery has been placed on the property of the New Syndicate Sapphir M. Co., Yogo. The season's work is reported satisfactory.

The mill at Kendall is crushing 300 tons of ore daily. The bulk of the ore comes from the west cut, 75 feet wide and 100 feet deep. The new shaft is down 250 feet, where drifting goes on. The company's refinery is ready for work.

FLATHEAD COUNTY.

With the drills operated by the Ameri-

can Kootenai M. Co., near Libby, 47 feet of holes were drilled in one shift of eight consecutive hours, including the time consumed in taking and setting up drill from one tunnel to another, which takes about one hour. Their mill has been started up.

GRANITE COUNTY.

F. D. Brown is manager the Henderson M. Co. at Sunrise. Eighty men are now employed. The mill is dropping twenty stamps crushing ore from the Queen and Bunker Hill mines. E. C. McCool is mill foreman, T. Botschelder mine foreman.

The Sunrise mill and concentrator, near Philipsburg, are in operation, the concentrator handling fifty tons of ore. The ore comes from the Bunker Hill mine, half a mile from the mill. All the claims in the district are reported practically controlled by the Henderson M. Co., which succeeds the Sunrise M. & M. Co. About fifty men are employed; F. D. Brown manager, C. C. Spencer superintendent.

L. U. Loomis is manager at Gold Creek where the Gladstone G. M. Co. is operating. The company has control of the Gladstone group of mines and has twenty-seven men employed. Excavation is completed. The company has built 4000 feet of flume and dug 4000 feet of ditch. A bedrock dam of cement and concrete has been built, collecting all the waters of the west fork of Blum creek. This furnishes 75,000 gallons per day. The mill is thirty tons capacity and treats the ore by the cyanide process. It is calculated that the ore can be mined and milled for \$4 per ton.

LEWIS AND CLARKE COUNTY.

The Twilight mine at Unionville, south of Helena, has been bonded by Butte men.

MADISON COUNTY.

The Gold Hill mine, near Parrot, is under option to F. A. Heinze and associates of Butte; consideration said to be \$40,000.

Minneapolis men have bought the Galena mine at Sterling for \$60,000. The Galena is a good producer and has been a profitable mine. Ore worth \$100 per ton is now on the dump. An inclined shaft comprises the principal development at present; deepest level only 225 feet.

The Fairweather M. Co. of Minneapolis which has a bond on the U. S. Grant mine, near Virginia City, say operations will be resumed October 10.

Casals reports a landslide which totally destroyed the hydraulic plant, including flumes, sluices, monitors, etc., of Thibert Creek M. Co., which cost the company \$60,000. The men who were at work had a narrow escape from death. The company was getting ready for the season's clean-up; besides losing their valuable plant, they also lost their season's work.

PARK COUNTY.

Livingston reports the probability of a big smelter to be installed at that point.

NEVADA.

To illustrate the present mining activity in Nevada is appended a list of one week's incorporations at the capital:

Home Run M. Co., \$80,000, Tonopah.

Salt Lake & Reno M. & M. Co., \$600,000, Reno.

Alpine Placer G. M. Co., \$100,000, Reno.

Yankee Blade M. Co., \$100,000, Tonopah.

Oro Flno M. Co., \$75,000, Reno.

M., F. & I. Co., Ltd., \$400,000, Reno.

CHURCHILL COUNTY.

Shipping borax from the mines at Cottonwood to Winnemucca has begun.

ELKO COUNTY.

D. A. Herron, general manager of the Lucky Girl mines, near White Rock, says he is operating a 20-stamp mill on the property and regular shipments are being made. About seventy-five men are employed in the mine and mill. The property is owned by a Marysville, Montana, company, who were proprietors of the Drummond mines in Montana.

LANDER COUNTY.

The gold and copper mine at Iron Canyon, sold last year to Eastern men, and subsequently resold to Pettigrew, Hyde & Fox, for \$75,000, is being developed and good ore extracted.

LINCOLN COUNTY.

A new hoist is going in on the Rio Vista claim of the New Era property. The New Era Co. will put in a pumping plant at the Boland well, and will pump the water to the Rio Vista; 6500 feet of pipe will be required.

Pioche says an assay from a picked sample from the Pioche mine, at Silver King, gave 8050 ounces silver. West, McGee & Wheatley will sack the rich ore.

A. Murphy is superintending work on the properties of the E. & F. Co. He tells the Tribune the ore from the new discovery at Silver King, 40 miles north of Pioche, spoken of last week, is a sulphide of silver and verifies all that has been claimed concerning its richness. He says the ledge has now been opened up for a

distance of 50 feet along the surface, the high-grade occurring in chambers and promising the means with which to continue development.

NYE COUNTY.

Tonopah will have water in the near future for milling, fire and domestic purposes. Rodgers & Adams of the Tonopah Water & Power Co., have bought 50 inches of water in Twin river for \$10,000. The company also has an option on other holdings on the river and the remaining water rights, and if the company take the same, are to pay an additional \$15,000. The company has completed a survey of the proposed line, 60 miles in length, from where the water will enter the 12-inch pipe to the reservoir in Tonopah.

Sodaville hears of a strike in the Tonopah Fraction in shaft No. 2 at 330 feet, measuring 7x17 feet.

S. T. Pearson, general manager of the Nevada Co. at Berlin, is milling an average of seventy-five tons of ore daily. Nearly 150 persons are afforded employment.

At Tonopah W. B. Sollender will put a 34 H. P. engine and hoist on the Gold Hill Extension claims, on which a double-compartment, all-timbered shaft has been sunk 75 feet. It is the intention to sink 500 feet before crosscutting.

WASHOE COUNTY.

The Pyramid Lake M. & M. Co. has opened bids to upraise a three-compartment shaft from the second level of the inclined shaft to the surface and to continue the shaft downward another 100 feet. There were four bids, ranging from \$3000 to \$8500. The contract was let to F. O. Norton. Work on the shaft will begin at once.

M. Scheeline has bought the sulphur mine near Steamboat Springs.

G. Wedekind, discoverer of the mine of that name north of Reno, says, while eating his lunch one day, he noticed a yellowish float rock that he thought was ore, and he gathered up one or more pieces and sent them to his son-in-law at Cortez for assay. After several weeks he learned that the ore assayed \$1400 to the ton. He followed the float up the hill and within 100 feet found the Wedekind mine.

WHITE PINE COUNTY.

The Rocco-Homestake mine reports an ore vein 8 feet high and 4 feet thick assaying \$40 per ton in lead, silver and gold.

NEW MEXICO.

GRANT COUNTY.

Because of high smelter charges the Aberdeen Copper Co. will erect its own plant at Lordsburg. Plans and specifications for a lead smelter of 100 tons daily capacity are drawn. It is expected to have it in working order Feb. 1, 1903. The company is running its concentration plant eight hours a day, all that can be done with the limited water supply.

OREGON.

BAKER COUNTY.

Near Sumpter, Superintendent Walker has begun work on the California concentrating plant. Coarse crushing Cornish rolls will be followed by jigs, where the Baker City says a Chinese who has leased the Salmon creek placer mines found a gold nugget worth \$15,000, the largest nugget ever discovered in Oregon. heavier pieces will be separated and saved. An aerial tramway 2800 feet long will be built from Blacksmith tunnel to the mill.

MALHEUR COUNTY.

F. J. Melkle says a 20-stamp mill will be put up on the Black Eagle mine, of which he is the principal owner and manager. It is low grade, averaging \$3 per ton; ledge is 250 feet wide and easily worked. They have water power to run a 100-stamp mill.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The new purchase of the Baltimore & Deadwood cyanide mill, on Deadwood creek, at the mouth of Blacktail, will be put to work reducing Columbus ore. On the northerly end of the property various upraises and crossdrifts have been made in the siliceous ore body, running \$20.

The Homestake has six mills, with an aggregate of 900 stamps, reducing 3600 tons every day, turning out \$18,000 daily.

The strike of the Hidden Fortune Co., in prospecting by drill for the continuation of the Grantz shoot, has been extended the present week over a further area. The company will sink a shaft to mine and raise the ore from the new development on the Bingham. A grade 100x600 feet is being excavated for the shaft, 500 feet southwesterly from the entrance to the Baltic tunnel. Superintendent Steel is grading for delivery of lumber for the shafthouse.

The Pluma M. Co. feel encouraged by late developments in the shaft it is sinking on its property, and by a recent mill run of ore in the old Pluma stamp mill,

showing the ore to carry \$5.42 per ton. It can mine and mill its ore with a mill capacity capable of handling 150 tons per day, for \$2 per ton, and has the property of the Hawkeye Co., together with its 40-stamp mill, situated at Pluma, and the aerial tramway connecting the mine with the mill for transportation of ore. The Pluma shaft is down 310 feet. Superintendent Ellison has installed the 12 drill compressor and is operating machine drills.

At Cyanide the Gold Edge Co. has siliceous ore in the main shaft at a depth of 300 feet. Superintendent Goodman thinks he is near the lower quartzite, and should large bodies of ore be cut on that level, it will stimulate deep mining throughout the whole of Ragged Top and Squaw Creek district.

T. J. Grier, manager Homestake M. Co., is locally credited with the statement that the company is preparing to construct a large stamp mill—not less than 400 stamps under one roof, and, possibly, 600—which will necessitate an auxiliary cyanide plant equal in capacity to those now in operation at Lead or Gayville.

The Searfish G. M. Co., Ragged Top district, is producing 6000 tons per month. All ore taken from the property is treated at their own mill. The gold is sent to the Government assay office at Deadwood. During August two bricks returned nearly \$24,000. The last brick sent out was 927 fine.

At Central City the shafthouse at the new Bingham shaft of the Hidden Fortune Co. is building. The old Golden Crown mill will be moved to this site and thus utilized.

At the Otto Grantz the company is drilling two new holes a day; the claim proves continuous, running from \$8 to \$200.

Lead says Chicago men are interested in the Anaconda G. M. Co., which owns 400 acres between Bear Butte and Elk creeks, 1½ mile west of the Uncle Sam mine of the Clover Leaf M. Co. The group is cut by four free milling ledges. Assays as high as \$88 a ton have been obtained. The general average is \$8 a ton. An order will be placed for a steam hoisting and pumping plant.

The last annual report of the Homestake Co.'s operations shows that the Homestake produced in bullion \$4,303,917.57 for the year ending June 1, 1902, against \$3,639,332.03 for the year ending June 1, 1901. The six stamp mills of the company produced 241,207.96 ounces of bullion, gross, worth \$3,747,406.14 in gold and \$28,496.74 in silver. Mint charges against this amounted to \$10,081.55, which left \$3,765,823.33. The cyanide plant at Lead, operated on tailings, produced twenty-five bars of bullion, valued at \$537,723.77. The proceeds of concentrates amounted to \$430.45.

The different mills of the company reduced during the year 1,218,089 tons of ore. Of this the Homestake mill reduced 287,134 tons; the Golden Star, 288,319; Amicus, 193,015; Deadwood-Terra, 169,435; Monroe, 139,200; Mineral Point, 83,705; Pocahontas, 57,290. The monthly average of ore milled has been 101,507 tons, or about 3850 tons a day. This ore has yielded \$3.53 a ton net. The monthly cleanups at the stamp mills have amounted to \$314,658.74 on an average, and the cyanide plant has yielded a monthly average of \$44,810.31. The financial report of the secretary furnishes some interesting figures. Among the receipts, in addition to the bullion amount, are shown bills payable, \$300,000; proceeds of sale of Black Hills & Fort Pierre Railroad to the C. B. & Q., \$1,000,000; balance of cash transferred, \$91,037.40; new capital stock issued, 8400 shares at \$75 a share, \$630,000. With numerous minor items and various balances the receipts are brought up to \$6,617,910.63. Incident to the operations of the different mills and mines the following disbursements have been made: Amicus mill, \$94,086.09; bullion freight, \$6298.50; B. & M. shaft, \$115,950.34; cyanide, \$202,483.48; cyanide construction No. 2, \$127,915.46; dividends for the year, \$1,260,000; Ellison shaft, \$21,753.12; general and legal expense account, \$27,490.59; Golden Star shaft, \$26,524.61; Golden Gate shaft, \$17,331.17; Homestake mill, \$119,613.29; Deadwood-Terra mill, \$103,560.40; Mineral Point mill, \$109,303.84; Monroe mill, \$78,028.92; Pocahontas mill, \$25,044.12; property purchased, \$302,451.95; promissory notes, paid in August, 1901, \$750,000; salaries, \$20,614; stables, \$32,602.66; maintenance of superintendent's house and housekeeper, \$5,353.07; survey, \$22,182.50; tramway, \$43,007.13; taxes, \$59,506; water and increased water plant, \$379,878.58.

Superintendent T. J. Grier says: "During the past twelve months 100 stamps were added to the company's milling facilities, so that at this writing 900 stamps are dropping on ore from the mine. Three months ago the installation of a Reider pump at the 1100-foot level was completed and the pump started. The mine is now equipped with pumping facil-

ities in duplicate. The Ellison shaft was sunk 100 feet during the past few weeks—is now 900 feet deep and is being sunk further. None of the other shafts on the property have attained greater depth than was reported a year ago. A second large cyanide plant is in course of erection at the north end of the property and will start about the latter end of August on tailings from three mills containing 360 stamps there located. Preparations are in progress looking to the installation at the Ellison hoist of a large compressor, with boilers to run it, in order to supply the deficiency in air felt in operating additional drills to supply with ore the additional stamps started during the past two years."

YANKTON COUNTY.

At Gayville, Cyanide No. 2 of the Homestake is completed.

The regular employees of the Columbus Co. at the old Portland mill are engaged on the reconstruction of the mill. New batteries and new guides are being put in; the sand pump has been moved 10 feet closer to the batteries. The intention is to re-roof the engine and boiler room and paint the mill. Practically all of the force formerly employed by the Portland Co. has been retained by the Columbus Co.

UTAH.

Near St. George, C. W. Johnson of Tonopah, Nev., has bonded the Paymaster group of mines adjoining the Dixie group on the south, for one year for \$80,000. The lessee is to commence work within thirty days, install a gasoline hoist and make a road from the Paymaster dump to the Dixie Co.'s road. A shaft 300 feet deep has been sunk.

JUAB COUNTY.

Ore shipments from Tintic district for the week ending Sept. 26 were:

	Cars.
Ajax.....	1
Alaska.....	1
Bullion-Beck.....	6
Carissa.....	1
Centennial-Eureka.....	17
Dragon (iron mine).....	18
Eagle & Blue Bell.....	15
Eureka Hill.....	8
Gemini.....	6
Grand Central.....	20
Lower Mammoth.....	2
Mammoth.....	9
Yankee Con.....	6
Total.....	110

W. D. Sheppard will put a mill on the Pioneer group of gold-bearing locations, 6 miles southeast of Diamond, Tintic district.

SALT LAKE COUNTY.

(Special Correspondence).—The Garland lease on U. S. M. Co.'s property are shipping 125 tons per month.

The Columbia C. M. Co. are doing considerable development work. The drift along What Cbeer vein from the Dederich upper tunnel for 600 feet shows values of 2½% 50 feet thick. This ore concentrates readily about fifteen tons into one, making a high-grade concentrate and a saving of 80%. The company is mining fifteen tons of second class, which averages 7% copper from the Alls-Well vein, which is being milled at the old Rogers mill; in addition to this they are shipping about thirty tons of first-class ore monthly, which averages about 25% copper. The ore is shipped to the Bingham C. & G. smelter at Bingham Junction. They are also driving the Cunningham tunnel, which is expected to tap Alls-Well vein about October 15, and will give an additional depth of 170 feet on the dip. C. H. Cook is superintendent in charge.

Bingham, Sept. 26.

(Special Correspondence).—The Tintic M. & Dev. Co., operating the Yampa at Bingham, have done about 4000 feet of development work. They were closed down from April till August. The incline shaft is 700 feet deep. The upper tunnel, 1100 feet, tapped the ore about 500 feet from the surface. The lower tunnel is in something over 2100 feet, running in the foot wall. Expect to cut the ore about the middle of next month. They are furnishing air from their compressor to the York mine. W. J. Craig is superintendent.

Bingham, Sept. 26.

(Special Correspondence).—The U. S. M. Co. at Bingham canyon hope to have their tramway in operation and shipping ore over the main line by Oct. 10. The branch they expect to have completed about Nov. 1. The tramway is about 14,000 feet in length. Two hundred and fifty men will be employed when the mine is running full capacity; employing 105 at present. The tramway will have a capacity when completed of 1000 tons in ten hours. They have 1,750,000 tons of ore blocked out in the mines. The U. S. Co. are the owners of the Centennial-Eureka, Old Jordan and Galena group, Telegraph and Niagara and U. S. smelter.

At present they are permitting visitors to go through their mines.

Bingham, Sept. 27.

The Bingham Con. wants an outlet for ores in its Brooklyn group at Bingham and has in a tunnel that at 2600 feet will connect with the shaft at a depth of 850 feet. The tunnel has been driven 1500 feet and the output of the Brooklyn next year will be passing through it to the furnaces.

SUMMIT COUNTY.

J. S. Free, superintendent Park City G. & S. M. Co., will work five claims overlooking Bonanza flat.

The New York Bonanza Co. has bought the Richmond claim, adjoining the Nall-driver and the New York, at Park City, for \$5000.

W. M. Wantland has bought the Lawrence group at Park City.

Superintendent Getsch of the California tells the Park Record that he has broken down about fifteen tons of ore in the intermediate stopes that give returns of seven-tenths ounces silver, 38% lead and \$5 50 in gold. The breast in the southwest drift is about 3½ feet.

TOOELE COUNTY.

(Special Correspondence).—Everything around Stockton nearly seems to be depending on the success of the tunnel being driven by the Honorine mine. As soon as the tunnel is finished or even commences to drain the surrounding country there will undoubtedly be a great deal of development work done in the neighborhood of Stockton, as well as prospecting through the hills.

The Oregon Short Line Railroad are employing quite a force of men, grading for their new line, which will pass through the city of Stockton. They have in operation a large steam shovel, made by the Bucyrus Co. of Milwaukee, Wis. When the road is completed it will be a standard gauge track from Salt Lake City, which is now narrow gauge.

The Honorine Co. are the owners of about thirty patented claims. The property has produced about \$2,000,000 down to the water level. They undertook to sink and did sink down to about 150 feet below water level, and at this depth were obliged to handle about 2000 gallons per minute, and soon decided to abandon pumping the water, as it was very expensive. They then commenced to figure on some other scheme for handling the water in their mine, and finally decided on driving a tunnel to drain the property. The tunnel is now in over 1200 feet. All of the work is being done by hand at present, as it is all soft ground. They have machine drills ready to start as soon as needed. The tunnel was commenced on July 7 and they expect to be able to start to drain the water by March 1, which will be about 4000 feet at that time. They have an air shaft, down now 240 feet, that connects with the tunnel. The insurance on their compressor plant, which was burned July 28, has not been adjusted as yet, but as soon as it is settled they will erect a new compressor plant. The plant, which was new, was entirely destroyed by fire. They are now getting air for their shaft and tunnel from the old compressor which was installed several years ago. The plant that was burned had been in operation only a short time.

The Black Diamond mine, which is near the Honorine, is down 180 feet and it is stated they have some very fine ore. Stockton, Sept. 25.

(Special Correspondence).—The Ensign G. M. Co. here in driving their tunnel have ore in the breast that assays from \$10.33 to \$86 70 in gold per ton. The tunnel is now in 250 feet. This company have fourteen claims. The quartz and lime is cut by a porphyry dyke. This ore is alongside the porphyry dyke extending across the face of the tunnel. F. M. Bishop of Salt Lake is president of the company.

Lincoln, Sept. 26.

Manager Dederichs, in the Black Diamond, Stockton, has 3 feet of lead carbonates on the 180-foot level.

UTAH COUNTY.

At Lehi the Salt Lake City Onyx & Mining Co. has possession of the Caroline group of claims, West canyon, adjoining the May Flower group on the south, and will develop it.

The May Flower is putting in pumping machinery.

WASHINGTON.

FERRY COUNTY.

At Republic the California mine has fifty men employed.

James Cronan, superintendent Bodie mine at Bodie has men upraising and sinking from the No. 2 level. A tramway is to be built.

OKANOGAN COUNTY.

Chesaw calls attention to placer discovery in Beaver county, 6 miles south of there. Nearly all the land in that vicinity has been staked as placer. There is an abundant water supply. The yield is shot gold and reports say there is plenty of it.

WYOMING.

CARBON COUNTY.

At Grand Encampment, the New Rambler mine has been sold for \$250,000, Holmes, Holiday & Hamilton retaining an interest in the new company.

The Big Horn Copper Co. has incorporated. The property is 3 miles south of Pearl.

Manager Davis will sink 100 feet on the Grant property, north of Pearl.

At Grand Encampment the aerial tramway of the North American Copper Co. is completed. It has a capacity of 700 pounds each half minute. The cost of transporting the ore from the Ferris-Haggerty mine to the smelter at Encampment, 16 miles away, in the past has cost \$8 a ton; with the tramway the cost will be approximately 5 cents a ton per mile.

FOREIGN.

BRITISH COLUMBIA.

Rossland reports the Velvet mine for ore treated at the Northport smelter received from sixty-three tons eighty-eight ounces of gold, sixty-six ounces silver, 2900 pounds copper; net proceeds the ore specified \$2027, average \$24 42 per ton.

B. W. Layton, who has returned from Marysville, thinks it will require between \$75,000 and \$100,000 to complete the Sullivan smelter and clear up the outstanding indebtedness of the Sullivan Group Co. He asserts that the work has been mismanaged; that the company within the past year had spent \$100,000 for the construction of a smelter and has practically nothing to show for it except a lot of brick, a flume and one or two other accessories that can be utilized in the completion of the plant.

During the week ending Sept. 26 the Granby smelter treated 5300 tons of ore; total treated to date, 523,274 tons.

At Slocan the Arlington and Speculator properties, acting in concert, will erect works for the treatment of their ores. The mill will treat the contents of the entire vein.

FRANCE.

At Commeny, on the 26th ult., the National Congress of French Miners adopted a resolution, by a vote of 80 to 18, in favor of an eight-hour day, including the time occupied in descending and ascending to and from the mine at meals.

MEXICO.

Mexico has at present 231 copper mines, 252 mines of silver and copper, 93 of gold and copper, 34 of silver, lead and copper, and 29 of iron and copper, a total of 639, located in twenty-two States and two Territories. The State of Sonora leads with 142 mines, followed by Chihuahua with 109, Durango with 72, Michoacan with 72 and Zacatecas with 64. Lower California is credited with 31 mines producing copper. These include the Boleo mine and make much the greater part of the copper product of the entire country.

Commercial Paragraphs.

THE Weigle Steel Pipe Works, Denver, Colo., has a contract for a new power pipe for the Highland Mary mine and mill, Silverton, Colo., a mile of 14-inch steel-riveted pipe under a 920-foot head, and a contract for a power pipe for the Elkins M. & M. Co. at Silver Plume, Colo., 6000 feet of 22 and 20-inch steel-riveted pipe under a 250-foot head.

MR. R. J. CORY, manager of Allis-Chalmers Co., Denver office, has recently returned from Mexico. While there, Mr. Cory closed the contract for his company with the Compania Minera de Penoles for extensive additions to their large smelting plant at Mapimi. The order amounts to some 800 tons of material, consisting of the well-known Wetley roasting furnaces, air compressors, pumps, etc.

THE Commercial Oriental Expedition Co., Seattle, Wash., says it will send a steamship from Seattle on Nov. 15, 1902, on a six-months' tour of the East; purpose purely commercial; route selected with a view of enabling the representatives of American business houses to test trade and to establish permanent agencies. The lower deck of the steamship is fitted for exhibition purposes and will be electrically lighted. S. G. Simpson is president.

THE Pelton Water Wheel Co. of San Francisco reports having just closed a contract with the Vancouver Power Co., of Vancouver, B. C., covering three Pelton wheel units, with a combined capacity of 10,000 H. P. The wheels are for direct connection to electric generators; the power to be used for electric railway and manufacturing purposes in the vicinity of Vancouver. As instancing the progress of electric transmission, may be mentioned the fact that the Pelton Co. has under construction at the present time Pelton water wheels aggregating 30,000 H. P., all of which are to be used in connection with electric transmission of power.

Personal.

T. T. BAKER has returned to Butte from Pony, Mont.

E. W. PARKER of the U. S. Geological Survey is in San Francisco.

D. FALCONER is superintendent Cortez mines, Lander county, Nev.

CHARLES ALLIS has returned from the Black Hills, S. D., to Chicago, Ill.

SCOTT WHITE is treasurer Greene Con. M. Co., Cananea, Sonora, Mexico.

W. J. WHITCOMB is now superintendent Keystone M. Co., Leadville, Colo.

H. H. TODD has returned from Hite Cove, Mariposa Co., to Alameda Co., Cal.

R. E. EVANS will be professor of mining at the Nevada State University, Reno, Nev.

CHARLES BUTTERS will arrive at Virginia, Nev., from New York City next week.

L. HAGEMAN succeeds E. H. Harrington as assayer Kennedy mine, Amador county, Cal.

C. D. GALVIN, largely interested in copper, will make San Francisco his future headquarters.

BERNARD MACDONALD is reported about to move from Rossland, B. C., to Spokane, Wash.

C. H. CUTTING, manager Troy-Manhattan Copper Co. of New York, is visiting Troy, Ariz.

M. E. HILTNER goes on the 10th as chemist for the Columbus M. Co., Central City, South Dakota.

JAMES COLQUHOUN, president Arizona Copper Co., is expected from Scotland at Clifton, Ariz., this week.

T. L. HUDDLESTON, superintendent Galena King, Stockton, Utah, has returned there from Butte, Mont.

W. O. CLYMO has returned to Butte, Mont., from an inspection of mining properties in White Pine county, Nev.

H. V. CROLL, manager Allis-Chalmers Co., Salt Lake City, Utah, has recently returned there from an Eastern trip.

W. W. ROSE, superintendent Boleo copper mines, Santa Rosalia, Sonora, Mexico, has returned there from El Paso, Texas.

H. I. WILLEY has returned to Nogales, Ariz., from Campo Santo Nino, Sonora, Mexico, where is located the Yaqui Copper Co.

A. L. TUTTLE has been appointed manager of the mines at Jimulco, Coahuila, Mexico, to succeed J. S. Whyte, who died recently.

MARK R. LAMB, mill man of Los Angeles, goes to Virginia City, Nev., in connection with the Blaisdell appliance in the Butters mill.

S. A. PARNELL, former superintendent Old Dominion, Globe, Ariz., is to take the superintendency of the Trimountain, Houghton, Mich.

MANAGER W. S. RICHARDSON, Bufo M. & S. Co., Santa Rosa, Sahuaripa district, Sonora, Mexico, has returned there from San Francisco.

BENJ. VENUTI has resigned from the White Pass, Alaska, traffic department, and is now general agent for the Dawson & White Horse Navigation Co.

MARTIN J. HELLER, examining expert for J. R. De Lamar, has returned to San Francisco after a three months' trip to the Copper River district, Alaska.

J. L. BUTLER, the father and founder of Tonopah, Nev., is in San Francisco engineering a mining deal looking to the further mineral development of that section.

A. ORME has been tendered the position of general superintendent of the mines owned and controlled by C. R. Ray, scattered over Jackson and Josephine counties, Or.

C. H. MACKAY will visit Grass Valley, Cal., to see the Allison Ranch mine, and the new mill, the Mackay estate being interested with J. L. Flood in the ownership of the mine.

B. GRANVILLE, president La Calera M. Co., has gone from Nogales, Ariz., to New York. John Henderson is manager of the company's copper mines near Chahorra, Sonora, Mexico.

G. BEVERIDGE, former owner Santa Rosalia mines, Sonora, Mexico, has returned to San Francisco. He will send a party of prospectors to the Sierra Madre mountains, Mexico, to be out six months.

MANAGER PROVOT is stated to have severed his connection with the Indiana-Sonora C. & M. Co., La Cananea, Sonora, Mexico. The properties are now in charge of C. E. Ricketts, consulting engineer for Phelps, Dodge & Co.

F. KLEPETKO, who resigned the management of the Anaconda, Mont., smelt-

ers some time ago to take the position of consulting engineer for the Haggin-McCune Copper Co., Peru, S. A., is still detained in New York City by illness.

H. A. SHIPMAN, former manager Stratton's Independence mine, Victor, Colo., goes for Bewick, Moring & Co. of London to take charge of the properties of the Cosmopolitan Proprietary Co., Western Australia, under a three years' engagement; salary, \$9000 for the first year and \$10,000 for each succeeding year. Mr. Shipman is now in Denver, Colo.

Catalogues Received.

A 4-page folder with mammoth half-tones portrays the successful carriage of salt in the works of the Colonial Salt Co., Akron, Ohio, by the use of the Robins belt conveyors, made by the Robins Conveying Belt Co., Park Row Bldg., New York City.

Advance Sheet No. 15, of the Jeanesville Pump, gives in graphic form a series of representations of that apparatus, showing range of operation, design and construction, with detailed data as to everything of possible connection therewith, apparently forestalling any question likely to be asked by intending purchasers. There is a separate treatise on "The Application of Condensers to Pumping Plants" that is of equal merit. The whole is admirably arranged and will be sent on request to the Jeanesville Iron Works Co., Jeanesville, Pa., or 1328 Seventeenth street, Denver, Colo.

The Crane Co.'s complete pocket catalogue of steam goods, etc., of date August, 1902, 4x7 inches, contains 464 pages, gives twenty-one full-page views of its different buildings and branches in principal United States cities, has a concise index summary, a convenient index and detailed illustrated showing of styles and prices of the numerous steam appliances that giant concern supplies. There are several new tables and the arrangement of the entire contents is such that any one subject can be readily found and understood. The bound volume will be sent to any address upon application to the company's central office at Chicago or of any of its numerous branches.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PORTABLE HAY-LOADING DERRICK.—No. 708,199. Sept. 2, 1902. E. Brust, Davisville, Cal. The object of this invention is to provide a compact, rigid, economically constructed device to be used for loading or stacking hay and the like. It is adapted to be moved readily from place to place in the field, requires no side stays or guys to steady it, and when placed in proper position it will pick up a load at any desired point and automatically swing the load to the point of discharge. It consists of a wheeled frame or base, a pillar or mast pivotally supported thereon, trapezoidal supports upon said base and carrying at their upper convergent ends oppositely disposed journal blocks in which the mast is turnable, a vertical truss rod connecting said blocks and the wheeled frame whereby the structure is rigidly united, a jib or arm supported intermediate of its ends upon the mast sheaves on either end of said arm, a fall rope woven through said sheaves, and direction sheaves upon the base frame, around one or the other of which said rope is adapted to pass; and other details of construction.

DUMPING WAGON.—No. 709,210. Sept. 16, 1902. J. J. Eagen, Oakland, Cal. This invention is designed to provide a simple dumping device applicable to the running gear of ordinary wagons. It includes a flat platform mounted on the running gear, a longitudinally sliding box or body having a plurality of compartments, means for locking the box in a horizontal position, or of allowing it to elide rearwardly for the purpose of dumping.

WOOL WASHING MACHINES.—No. 709,227. Sept. 12, 1902. J. Keefe, San Francisco, Cal. This invention is designed for cleansing wool and consists in the combination with washing tubs or tanks of a series of endless traveling helte in pairs within the washing tub having adjacent faces of the two belts moving in the same direction, and one or both having projecting spurs to insure the travel. Carrying rollers receive the wool at the upper ends of the belts, and it passes thence through squeezing rollers and is again submerged in the second tank, through which it passes in like manner, and so on until it is sufficiently cleansed.

ANIMAL EXTERMINATOR.—No. 709,207. Sept. 16, 1902. L. N. Cornett, Natividad, Cal. This invention is designed to generate smoke or other noxious vapors, and to force such vapors into the holes of burrowing pests, such as gophers, squirrels and the like, the apparatus being portable. The generator chamber has a removably perforated receptacle fitted therein and adapted to contain the combustible materials, an air compressor and connection between the compressor and the generator.

HARNES ATTACHMENT.—No. 708,676. Sept. 9, 1902. J. T. Surbaugh, Arbutuckle, Cal. The object of this invention is particularly to provide a means for securing buckles, rings and the like upon harness or wherever else buckles and rings are used in connection with a leather or like support; and to provide a durable reinforcement for

the ordinary leather strap and stitching by which buckles and rings are held. The fastening device is carried by the strap and a retainer consisting of a metal plate between the layers of the strap, the plate being of less width than the strap and bent at its center, and the members brought together to lie one on the other in direct contact and concealed from view by stitching the edges of the layers together. A rivet passes through the end of the plate and the strap to secure the parts together.

ROCK DRILLS.—No. 709,191. Sept. 16, 1902. R. Avery, Sausalito, Cal., assigned to R. Avery Drill Co. of San Francisco, Cal. This invention is designed to improve the mechanism for carrying turning and reciprocating drills such as are used for perforating rock. The drill is so supported that it may be directed in any direction, and may also be withdrawn, moved out of line with the hole and restored to its proper direction whenever necessary. Connected with the drill is a mechanism operated by a flexible cord which is connected with the person of the bummer welder, so that the swing of the body will raise and turn the drill at each movement, and place it in position for a new stroke, the whole business being carried on by a single process.

BAG MAKING MACHINE.—No. 709,451. Sept. 16, 1902. J. F. Ames, Portland, Or. This invention is designed for the manufacture of bags complete from cloth which is furnished in continuous rolls or lengths of any desired quantity. The apparatus includes means for feeding the cloth from a continuous roll and advancing it through the machine, first to a cutter by which it is cut to the desired length, second to a folder by which the separated sheet is folded centrally to bring the edges together. This sheet is then advanced to a sewing machine which sews one end. It is then advanced to a point where its direction of motion is changed, and is moved transversely and at right angles with its former direction thus passing the edges of the folded sheet through another machine, sewing up this edge. Bags thus formed have the advantage of having a finished selvage at the open mouth.

GLOVES.—No. 709,555. Sept. 23, 1902. R. N. Carson, San Francisco, Cal. The object of this invention is to provide an improvement for gloves which are used for handling hot metal, wire ropes and other uses where there is great strain and wear, and it consists in a novel reinforcement for the palm and the inside of the thumb and forefinger, so that these extensions will receive the principal part of the wear and prevent the rapid destruction of the glove.

CULTIVATING PLOW.—No. 709,601. Sept. 23, 1902. A. Horner, Paaulio, Territory of Hawaii. This plow is especially designed for working the ground between rows of sugar cane or equivalent vegetable product which is grown in a similar manner. It consists of a pair of angularly mounted revolving disks adjustable forward and backward with relation to the team and inclining toward each other at the top, a double or shovel plow adjustably located in front of the disks and a sub soil plow in the rear, these parts being all adjustable with relation to each other, so that the ground can be thoroughly cultivated, weeded, destroyed and the earth hilled up against the rows to any desired degree.

TRACTION ENGINE.—No. 709,593. Sept. 23, 1902. Daniel Best, San Leandro, Cal. This invention is designed to provide an elastic support for the boiler, engine and supporting frame, and such connection between the frame and the hearing wheels and axle that the movement of the supported parts upon the springs will not interfere with the proper meshing of the gears by which power is transmitted.

METALLIC FENCE POST.—No. 709,617. Sept. 23, 1902. J. A. Utter, Crawfordsville, Ind., assigned to J. F. Utter, San Francisco, Cal. This invention provides a metallic fence post having a cement base, the post being durable and ornamental in character and capable of standing firmly in the ground and holding the horizontal line or woven wires of a fence securely by means of metallic clamps so adjustable in character as to allow the wires to be fastened to the upright bars of the post at any desired distance apart, and to be readily shifted up and down with relation to each other.

ADJUSTABLE LOADING CHUTE.—No. 709,609. Sept. 23, 1902. L. Rosenfeld, New York, N. Y. This device is designed for loading vessels from lighters, docks and other places where the vessel may be at a very considerable height above the point from which the coal or other cargo is to be discharged into the vessel. A frame is rigidly secured to the deck of the vessel, an inclined chute, one end resting upon a transverse support slidable in vertical guides on the frame, and the other suspended in such a manner and so adjustable as to deliver the material into the desired receptacle.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING SEPT. 23, 1902.

709,733.—MINING DREDGE—Barton & La Bud, Oakland, Cal.
709,813.—MOUTH MIRROR—Bennett & Thatcher, S. F.
709,593.—TRACTION ENGINE—D. Best, San Leandro, Cal.
709,571.—FURNACE—W. N. Best, Los Angeles, Cal.
709,737.—CONVEYER—M. Bradfield, Los Angeles, Cal.
709,743.—WRENCH—C. Bushy, Fossil, Or.
709,596.—GLOVE—E. N. Carson, S. F.
709,534.—SHOE LACING HOOK—N. H. Clark, S. F.
709,476.—COOKING CABINET—H. F. Fashian, S. F.
709,601.—PLOW—A. Horner, Paaulio, Hawaii.
709,822.—ORE CRUSHER—C. C. Laue, Los Angeles, Cal.
709,782.—OIL BURNER—L. K. Leahy, Los Angeles, Cal.
709,517.—CONVEYER—G. W. Menefee, Berkeley, Cal.
709,609.—LOADING CHUTE—L. Rosenfeld, S. F.
709,725.—BOOKKEEPING—C. Seliz, Seattle, Wash.
709,803.—OIL BURNER—J. P. Simonsen, Oakland, Cal.
709,541.—POUCH—Smithline & Zaiser, Los Angeles, S. F.
709,521.—AIR COMPRESSOR—E. Y. St. Croix, Madrona, Wash.
709,613.—FRUIT GRADER—F. Stebler, Riverside, Cal.
709,562.—FRUIT CLEANER—Swan & Richardson, Ontario, Cal.
709,557.—CLITCH—E. Turney, Portland, Or.
709,806.—INDICATOR—H. S. Tittle, Los Angeles, Cal.

Latest Market Reports.

SAN FRANCISCO, Oct. 3, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 51½c, refined (1000 fine); San Francisco, 51c; Mexican dollars, 43½c San Francisco, 40½c New York.

COPPER.—New York: Standard, \$10.75@11.25; Lake, 1 to 3 casks, \$11.65; carload lots, \$11.25; Electrolytic, 1 to 3 casks, \$11.45; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.40; carload lots, \$11.25. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £53 6s 3d spot per ton.

The exports of copper for the month of September were 12,354 tons, making the total since January 1st 130,179 tons, as compared with 69,650 tons for the same period last year and with 120,594 tons in 1900.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10.15s per ton.

New York reports assert that plans are concluded for formation of a lead combination to include all the important lead manufacturing concerns in the country, capital to be \$60,000,000, and plans for financing the deal satisfactorily arranged.

"It is expected that interests identified with the American Smelting & Refining Co., the Morton Trust Co. and the National Lead Co. will be the concerns which will supply the necessary cash. The scope of the new combination will include manufacturers of sheet, pipe and white lead rods. The American Smelting & Refining Co., which is the largest producer of pig lead in the country, will also be largely interested as a stockholder.

"The directors will be chosen from the present board of directors of the National Lead Co., the American Smelting & Refining Co. and the Union Lead & Oil Co."

The matter is of prime importance to lead mining, for with such a combination as above outlined the entire production and use of that metal, from the vein to its sale as white lead, pig lead, sheet lead or lead pipe, would be under one management. The new combine is understood to be the personal undertaking of Benjamin Guggenheim, who is not a general partner in M. Guggenheim's Sons. He is said to have been attracted by the opportunities for economy and increased profit promised by the centralization of every branch of lead production and manufacture under a single management. The Union Co. attracted the attention of the National Lead interests through the use of the Bailey method of corroding lead, and it is said President Cole of the National Co. concluded that the combination of the two companies had become a trade necessity. When Benjamin Guggenheim saw that a combination of the lead users of the country was about to take place he resolved to secure it for a partner or an ally to the great smelter combine.

SPELTER.—New York, \$5.50; St. Louis, \$4.50; London, £19 per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$25.30; San Francisco, ton lots, 29c; 1000 lbs., 29c; 500 lbs., 29c; 200 lbs., 29½c; less 30c; bar tin, 3½c. London, £115 12s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 ½ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48 00 large lots; London, £8 15s; San Francisco, local, \$46.00 ½ flask of 7½ lbs.; Denver, \$49.65. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 1½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 16½c.

NICKEL.—New York, 50@60c ½ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.50; gray forge, \$20.50; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31 and \$31.50; open hearth billets, \$33 and \$33.50; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, \$2.45; K. B. & S., \$2.80; Howmoor, \$2.75; Trowell, \$2.75; Portland, \$3.00 per bbl.

LIME.—Santa Cruz, \$2.00; Roche Harbor, \$2.00 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, \$20 00@22 00; extra sizes higher; redwood, \$22.00@23 00; lath, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13 50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.30; Cut, \$3.30; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c ½ set; 14 oz., 40s., 9½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$3; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$7.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$13.00; Rock Springs, \$9.50, long ton, Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c ½ lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66½ B, 2c ½ lb.; soda ash, \$2.00 100 lbs.; hyposulphite of soda, 2½@3c ½ lb.; blue vitriol, 5½@6½c ½ lb.; borax, concentrated, 7@8c ½ lb.; chlorate of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3½@3¾c; California refined, 2@2½c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3@4c ½ lb.; Cal. s. soda, bbls., \$1.25 @1.50 100 lbs.; sks., \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls., 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c ½ lb.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Ecocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs., 25c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., 95c; cs., \$1.05; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, 4c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c ½ lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, ½ lb., 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) ½ lb., \$1.25.

MERCURY.—Bichloride, ½ lb., 90c.

MOLYBDENUM.—25c. ½ gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) ½ lb., 80c.

SILVER.—Chloride, ½ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ½ lb., \$1.00.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c.

ZINC.—Dust, ½ lb., 10c.

ZINC.—Sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

Mining Engineer wants position as superintendent. Practical miner, millman, cyanider and assayer. Experience extending over twelve years. Graduate School of Mines. Address A. R. S. M., this office.

Cyanide Chemist, at present superintendent of cyanide mill, will be open for engagement after the 15th of October. Has been assayer of custom mill and mint. Ten years' practical experience of gold metallurgy in different countries. Address A. B. C., care Mining and Scientific Press, 608 Mack Block, Denver, Colo.

Have had eight years' experience as chief chemist and assayer for large copper smelting companies; since then have been in charge of mines and smelting operations. Would like a position with some good, reliable company; can give the best of reference. Address E. M. C., this office.

ASSAYER wishes to change position. Is also experienced amalgamator and miner. Would like to take charge of small plant. Speaks Spanish. "Aleman," Mining and Scientific Press.

GOLD DREDGING.—Mining engineer with 8 years practical experience in gold dredging is open for an engagement. X. Y. Z., care Mining and Scientific Press.

COMPETENT SUPERINTENDENT wants position in California; 15 years' experience in running mines, mills and smelters for profit, and managing men. College bred and technically educated. Formerly held positions as assayer, mining engineer, accountant, superintendent, and manager. Member A. I. M. E. High testimonials. Address "Superintendent," Box 813, Seattle, Wash.

WANTED.

Position as superintendent or assayer. Have had experience in mining, milling, cyaniding, smelting and putting up machinery and operating the above. Have a good assay outfit. Can sharpen tools. J. L. Wetmore, 1223 S. San Joaquin St., Stockton, Cal.

WANTED.

WANTED.—BY TWO ENERGETIC AND EXPERIENCED mining men the acquaintance of persons interested in the development of mining property in old Mexico. Address D. L. C., care of this office.

WANTED.

SURVEYORS' TRANSITS.
Box 73, Stockton, Cal.

WANTED.

Mine or Dump of REFRACTORY ORE, on working bond or lease.
Address C. W. C., care of this office.

CASH BIDS on 20 Stamp Mill, complete, 1000-lb. stamps. Wanted, First-Class Millwright to erect the same. Wanted, First-Class Superintendent, Machine Drill Men, Miners and Timbermen, Mining Blacksmith, First-Class Electricians—Constructing, Superintending and Operating. Address "Gold Mine," care of Mining and Scientific Press.

FOR SALE.

FOR SALE.—Well established Assaying and Engineering business in principal city in northern California. Building (on leased ground), nice furniture assaying and analytical equipment cheap for cash. Fine opportunity for two young men. Good reasons for selling. References. Address Box 100, Kidding, Cal.

The Mines Exchange, Ltd.

Mines and prospects in British Columbia, the Western States, and Mexico, for sale. Free milling gold properties a specialty. Write us for reports and information. Bank references given. Address THE MINES EXCHANGE, LTD., P. O. Box 594, Salmon City, Idaho.

ASSESSMENT NOTICES.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of September, 1902, an assessment (No. 3) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of November, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of November, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Sbaeta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of September, 1902, an assessment (No. 3) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of November, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of November, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

OHAS. BOVONE, Secretary.

Office—415 Front street, San Francisco, California.

Fuel Oil on Railways.

Little fuel oil is in use on railways as yet. Its use is increasing, and in California coal is being dispensed with. The Southern Pacific Co., operating in California, Nevada, Arizona, Oregon and Texas, has determined on converting every locomotive on its line into oil burners. By December, 1903, coal will have been abandoned by that railway company.

Elaborate tests show that the railway engines on one division on an average require twenty-four barrels of oil for every 100 miles. To fire with coal for the same distance would take five tons, the saving per 100 miles by using oil ranging from \$16 to \$20, the company figuring that on the coast divisions alone can thus be secured a saving of \$100,000 per month. Apart from the manifest economy of the change from coal to oil, the matter becomes one of present necessity for some Pacific coast roads because of the Pennsylvania and Utah coal shortage, it being at present almost a choice between going back to wood or changing to oil, the latter, of course, being preferable.

So great an industrial change has had the effect of directing attention to the methods of handling this fuel oil at railway terminals—how it is delivered from tank cars to storage tanks, and thence to the locomotive tenders. At a recent meeting of the Pacific Coast Railway Club at San Francisco, Cal., this was made a special subject, and much information was given. The matter is one of at least secondary interest to miners and metallurgists everywhere, as the use of oil is spreading and the economics of its distribution is hence deemed of sufficient importance to be noted in a mining paper.

At Tucson, Arizona, and Bakersfield, Cal., the oil from the tank cars is unloaded by means of compressed air at a pressure of fifteen pounds. This is slow, as it takes thirty-five minutes to unload a car, and as the cars are not air-tight there is considerable waste of air. Steam is used to heat and thin the oil, when necessary, the oil being piped to a two-compartment storage tank and thence fed direct to the tenders by air pressure. In large quantities it can be more readily got into the tender by gravity from an elevated tank, being first forced into the latter by steam or air pressure. This is the method in use at Los Angeles, Cal., where 50,000 barrels per month are used. At Oakland, Cal., where 25,000 gallons per hour are used, the oil is discharged from the tank cars into a 12-inch pipe, eight or ten cars being simultaneously connected therewith, and

thence pumped to the storage tank, from there pumped again to an elevated tank, whence it flows by gravity into the tenders. The same system is in use at other stations where considerable amounts are handled. The cost of pumping is figured at 3 cents per 1000 gallons. The general experience is that in small stations pumping is preferable. Where large amounts are used the gravity system is most economic. Mining companies using fuel oil could probably find a rotary pump with a gas engine for power, or a force pump with steam power, of greater value than building and maintaining the structures necessary for delivery by gravity, as that seems only to be best applicable where the quantity handled, as in the case of railways, justifies the initial expense.

Ancient California River Beds.

It has been said that some streams of California have been turned bottom upwards. It would be truer to say they are piled one over another three or four stories deep. This labyrinthine system of water works is puzzling to the geologist as well as to the miner. The information gathered by the miner in drifting along these ancient courses is practically all known concerning them. From knowledge thus gained geologists have attempted to classify and map out their topography and grades; but the limited areas touched by the miners makes the task of the geologist a difficult one; and it is not surprising that such eminent authorities as Le Conte and Whitney disagree in regard to some of the forces which have effected the evolution of this intricate system. The renewed activity in drift placer mining

may clear up many points regarding these old water systems that are obscure. It is sufficient to know that whether any of them which may be made available, either for the production of gold or water, belong to the first, second or third drift periods; or whether their courses ran north, east or south; and crossed or recrossed each other in their meanders; and whatever their average grades may have been, it is certain that all of them eventually turned to the west, and flowed into the Pacific ocean, or its counterpart which then existed. It is suffi-

cient to know that these ancient systems extended into southern California; and however their channels became filled—whether by depositions when submerged in ocean depths, or by upheaval of barrier dykes from beneath, or by overflows of volcanic matter which filled up and obstructed their courses; or by all of these causes consecutively combined—the fact is that these old channels still exist, and that they contain gold in great quantities. Drift mining in California has an unlimited future before it. Hundreds of millions of dollars will be taken from the ancient placers—the auriferous gravels of the water courses of a former age now buried under lava and other deposits. Only a fraction of the rich ancient channels have been tapped. These buried beds of old rivers where drift mining has been chiefly pursued are met with high among the foothills where their courses have been cut across by modern streams, through which their waters have been to a great extent drained off, leaving the gold in the deposits of gravel near bedrock. These are the placers sought for by miners, and are generally supposed to belong to the second or third drift period as classified by geologists. The extent of unprospected old river beds is only a matter of conjecture.

As the modern rivers drained the old channels, where higher position and porous nature of the materials with which the older beds were filled permitted this to be done; so, toward the coast, the ancient rivers pass under the modern—their position is reversed—and in this case the older channels drain off, or largely absorb the waters of the present open surface water courses; except at flood times, when all channels—both ancient and modern—are filled to repletion.

Good authorities estimate the aggregate length of the ancient water channels in the State of California at 400 miles. This refers to the main channels only, and does not take into account the laterals or small branches which empty into the mains. It includes only the supposed workable gold-bearing channels, and does not take into account cemented tributaries, which from the miner's point of view are considered of slight economic importance. Based on the very limited drift workings which have been exploited this estimate is barely approximate. It is reasonable to conjecture that the lengths of the old, older and oldest systems of the three drift periods, as classified by geologists, were each of them equal in extent to the present river system—if granted the extent of drainage area and rainfall were the same.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Mill, Sampler and Boarding House Silver King Mine, Park City, Utah; Table Floor of Silver King Mill, Park City, Utah, 200. The Cripple Creek Reel; The Cummer Patent Mechanical Stoker, 207. Mining and Metallurgical Patents, 208.

EDITORIAL.—Usona; The History of a Catalogue; Making a Mine Report; British Columbia Mining Conditions; "Cyaniding Rock in Place;" Representation at the St. Louis Exposition; Cabinet Department of Mines and Mining; The Strike of the Coal Miners; A Modern Charcoal Plant, 201.

MINING SUMMARY.—200-210-211-212-213.

LATEST MARKET REPORTS.—214.

MISCELLANEOUS.—Fuel Oil on Railways; Ancient California River Beds, 200. Concentrates, 202. Direct Cyaniding of Wet-Crushed Ores in New Zealand, 203. The Silver King Concentrating Mill, Park City, Utah, 204. Sunlight a Variable Quantity; Power Required for Isothermal Compression, 205. The Gold Production of North America, Its Geological Derivation and Probable Future, 206. Oil Process for Ore Concentration; The Cripple Creek Reel; Refrigeration by Compressed Air; Self-Contained Dryer, 207. Mining and Metallurgical Patents; Removing Oil from Exhaust Steam; Gold on Hand to Be Produced, 208. Books Received; Catalogues Received; Personal, 213. Commercial Paragraphs; New Patents; Notices of Recent Patents, 214.

THERE is a new name or term coming into commercial use—Usona—as an abbreviated designation of this country—United States of North America—which is technically correct and at the same time easy to use and remember. Several concerns in various lines of business now hear that title, and its use is destined to grow.

In this issue appears the first of a series of articles on "The History of a Catalogue," of unusual interest to mining machinery manufacturers. It is written by a man who for many years has been engaged in the work of preparing such trade treatises. The catalogue is such an important and expensive adjunct of modern advertising that a critical discussion of it from the standpoint of practical experience must be interesting. It is the first time the matter has been so treated, but its importance deserves such notice. Mr. Fitch's statements and conclusions may not be unanimously accepted, but the publication of the series in this and succeeding issues will create a discussion of the subject that must be of benefit to all interested.

THERE are two ways of making a mine report, and while both may be correct the conclusions may exhibit considerable divergence. Some mine experts report gross values, others net values. The first could correctly report \$1,000,000 in sight in a mine; the other with equal correctness might be able to report not one dollar "in sight." For the property might be so constituted that while there was manifestly \$1,000,000 worth of ore available, yet the conditions were such that it would cost \$1,000,001 to extract and treat the ore. It is simply a question of reporting gross values or net values. As time goes on the tendency on the part of the mining engineer examining a mining property will be to report on the basis of net values. Just which is the most valuable depends largely upon the point of view. The investor will be inclined to attach more importance to the report that is based on probable net values.

STRONG objection is made to editorial statements concerning British Columbia mining conditions. But the statements are true, and it is just such publicity that will best help British Columbia miners. Nothing has been said that cannot be verified. The trouble with British Columbia is that it is governed too much. It has too many laws now. What it needs is a repeal of some of them. It is a good mineral country and this paper recognizes its importance. It is always easy and more agreeable to say only nice things, and easier still to ignore a locality, but con-

ditions can generally be improved by publicity. The policy of this journal is a creative one, and whether it be British Columbia or anywhere else that mining is carried on, this paper has intelligent opinion on existing conditions and wants to aid in that section's advancement. That is part of what the paper is for.

In the issue of February 2, 1901, appeared an article written by a California miner entitled "Cyaniding Rock in Place," which was a humorously exaggerated account of what purported to be a plan of wholesale treatment of gold ore by cyaniding without the trouble of even removing it from its pristine location with satisfactory result. By one of those coincidences that are sometimes noticeable, in the same part of the State has been tried the successful experiment of dispensing with the usual fine crushing, from 80% to 90% of the values being extracted by the cyanide process from the ore crushed solely by the use of a rock breaker and a grizzly, the consumption of cyanide being about one-half pound per ton of ore, length of treatment from sixty to ninety hours. The ore is an oxidized iron pyrite in Shasta county, Cal., and like similar California gold ores needs but to be cracked rather than finely comminuted, the structure of the quartz being so weakened by the intrusion of the pyrite as to readily break in the work of coarser crushing, leaving the gold particles to be readily acted upon by the cyanide solvent.

THE advantage of proper representation of the mining industry at the St. Louis Exposition is commended to the attention of the legislatures of the mining States. Mention is made just now because in many mining commonwealths is going on present active canvass of votes for State senates and assemblies, and the matter is worthy of being brought to the attention of those seeking election. They will compose the legislature in their State or Territory that will pass upon the bills introduced next winter making State appropriation for mineral exhibits at the St. Louis Exposition. Rightly managed, small appropriations could be made a paying investment in every case. The tendency is to make big appropriations and put them into the hands of incompetent men. Instances of the truth of this will occur to every reader. Better a State or territorial appropriation of \$25,000 judiciously administered, than a \$500,000 appropriation given over to grafters and parasites. Every mining State and Territory would find it good business as an advertisement to make appropriation next winter for representation of the mining industry at the coming exposition at St. Louis, Mo., and put it into the hands of men for distribution who have personal standing and integrity, and business ability beyond that required to audit and endorse foolish and unworthy expenditure of the people's money.

If any additional argument were needed in favor of a cabinet department of mines and mining, it is strikingly furnished by last week's action of President Roosevelt in his well-meant but unsuccessful efforts to get the coal operators and striking miners together. To those who have all along asserted that the proposed department was not needed the action of the President of the United States is commended as illustrative of existing facts. Of course opponents of the idea will write in reply to this, saying in effect: "Is it possible that you imagine that a department of mines and mining could have the slightest influence or effect upon the present unhappy situation?" Possibly no immediate effect at this critical stage. But all things work out in logical lines, and effect always surely follows cause. Suitable recognition of the importance of the mining interests of this country requires a cabinet department of mines and mining, not for control, but guidance. While this paper has all along considered that the metal mining industries of the Nation were most intimately concerned in this matter, and has advocated the measure solely in their interests, yet it is believed that if such department now existed suitable attention thereto bestowed upon the non-metallic mining interests of the country would tend to mitigate if not to wholly solve the pressing problem presented by the existing conditions even in coal mining. We are not unmindful of the conditions precedent to and now pulsating through

the strike—politics, greed, ill will, the great financial interests involved, and the stubborn joy some natures feel in fight, but despite all of these diverse factors in the problem it is our belief that had there been a cabinet department of mines and mining begun two years ago the present deplorable situation would not exist. As a business proposition the suggested department would "pay."

WIDESPREAD DISCUSSION of the present great strike of the anthracite coal miners brings out many points. There are a few that do not seem to have expression: One is that while nearly every other business is affected thereby, the business of gold mining is not in any way dependent thereon. Another is that the inevitable result will be more and wider use of machinery when work is resumed, as, of course, it ultimately will. A third condition is the future increased use of appliances for burning soft coal. Consumers of anthracite are now forced to experiment with soft coal burning devices, and such experience must result in improved equipment for the use of such coal with less production of smoke. It is the smoke and soot that constitute the chief objection to the use of bituminous coal, and it is probable that devices in that direction will be one result of the present strike that will make possible cleaner and more satisfactory use of soft coal. That such devices already exist is known, but the present conditions among Eastern coal users will direct immediate economic attention to their existence. Eventually this whole coal trouble means the realization among coal burners and steam users of the cost and unreliability of solid fuel and a "boom" for gas engine manufacturers. The American people have a faculty of cutting industrial knots, and when, as in this case, the question ceases to be one of employer and employee, and affects the public, a radical way of lessening future trouble in that direction will be found.

In a modern charcoal plant, such as that at Sault Ste. Marie, charcoal is made with minimum of handling and all the by-products are saved. The plant consists of twenty oven retorts, each of eight cords capacity, being 46 feet long, 6½ feet wide, 8½ feet high. These twenty retorts are set up between brick walls, about as a steam boiler would be set. A standard gauge railway track runs through each retort. The wood on iron cars holding two cords each is run into the retorts, 160 cords in all, each end door closed, fires started underneath and the wood carbonized into charcoal in from eighteen to twenty-four hours. Then the carbonized product is run into an iron cooler where it stays twenty-four hours, thence into another iron cooler where it stays twenty-four hours more, when it is ready for use. The wood alcohol acetate of lime, distillates of wood tar, creosote, guaiacol, etc., are all saved. This way of making coke and saving the by-products is comparatively new, the first plant of twelve ovens having been put up at Syracuse, N. Y., in 1893. Last year 1,179,900 tons of coke were produced by by-product ovens in this country, as against 12,850 tons in 1893. The 1901 value of the tar, sulphate of ammonia and ammoniacal liquor so produced was \$1,029,876—35% of the value of the coke produced. It is within the bounds of probability that in this country, as in Germany, the by-products of coke manufacture will pay all the costs of coal mining, coke making and other accruing expenses, making the coke itself a matter of net profit to the miner. It is interesting to note the variety of such by-products in the grimy production of coke and the multitude of their uses. The brilliant dyes that sparkle in the sunlight, the ammonium chloride used for galvanizing and electrical purposes, the carbonate used as baking powder in millions of kitchens, the aqua and anhydrous ammonia used in refrigerating and ice factories, and even cyanide of potassium, the solvent of gold, the latter derivable from ammonia. Cyanogen is another resolvable constituent, being an impurity which may be removed by the use of an alkaline iron salt; the cyanogen is formed into a ferro-cyanide of potassium or sodium in solution; this solution then evaporated to the crystallizing point and the crystals then purified. The list might be indefinitely extended. Coal tar used in the manufacture of roofing paper, street paving, etc.; creosote, benzol and other products, the whole constituting one of the triumphs of modern chemistry.

Concentrates

ONE pound copper is added to every \$2000 silver coined in the U. S. Mint.

By multiple cable is meant a cable containing two or more insulated conductors.

THE temperature of a 30-candle-power incandescent electric light would be about 2400° F.

HAVING 130 feet head of water and 48 inches water, would, theoretically, give 15 04 H. P.

THERE are about 1000 oil companies in California, and about 100 with stock of present purchasable value.

ONE PART RESIN, one part pitch and one part plaster of Paris, thoroughly mixed, forms a good lining for acid troughs.

THE "miner's ton" in Great Britain consists of 21 cwt. of 112 pounds each—2352 pounds—and by this ores and mattes are sold.

THE 276 miles of 8-inch pipe line from Bakersfield to Ft. Richmond, Cal., weighs 2½ pounds to the foot, 149,160 pounds to the mile.

THE ratio of friction to pressure for belts over wood drums is, for leather belts when worn, .47; when new, .5; when over turned cast iron pulleys, .24.

A MANILA ROPE, 3 inches circumference, weighs .297 pound per foot. Its breaking strain is 6115 pounds. A safe load for it in hoisting is 611 pounds.

THE best lubricant to use on aluminum when turning it in a lathe is either petroleum or water, and in the press, when it is being drawn or stamped, vaseline.

TO RENDER wood flexible, and at the same time non-inflammable, it is coated with or immersed in a 6% solution of caustic potash or a 5% solution of caustic soda.

A TON of ore that will average 1% quicksilver will produce twenty pounds, worth \$12. Should the ore average one-half of 1% right through, it can be handled profitably.

THE cost of coke ovens is dependent upon a variety of circumstances—locality, number, transportation, etc.; 500 coke ovens in that locality could probably be built for \$350 each.

OIL for fuel purposes has the following chemical composition: Carbon, 88%; hydrogen, 10.75%; oxygen, 1.25%. The two other impurities present in the mass are water and sulphur.

THERE is a special tariff on American machinery or appliances imported into the Philippines. It took effect Nov. 15, 1901. A copy of it can be had from any U. S. customs collector.

CADMIUM is a common constituent of zinc ore. The metal is now worth about \$1.50 per pound. The use of it is very limited, and a slight increase in the output would send the price tumbling.

HYDRATED FERRIC OXIDE is an antidote to arsenical poisoning, rendering that metal insoluble in water or in the fluid secretions of the body. To be most effective it should be freshly precipitated.

THERE will be a meeting of the executive committee of the California Miners' Association in San Francisco, on the 18th inst., to set date for the convention of 1902 and determine the future policy of the Association.

GOLD was discovered in Colorado in January, 1859. The State has yielded since then gold to the amount of over \$400,000,000. Gold was discovered in California in 1848. That State's gold output is figured by some statisticians as being about \$1,400,000,000.

THE gauge pressure being 100 pounds, the volume of free air used per shift of eight hours for a 3-inch drill at sea level is from 25,000 to 42,000 cubic feet; at 5000 feet elevation, 30,000 to 48,000 cubic feet; at an altitude of 10,000 feet, 35,000 to 60,000 cubic feet.

THREE CANDLES to a shift is a good allowance, and a miner ordinarily would have a little surplus. A shift boss or other underground worker moving around considerably would use five. Air drill workers would average about the same number.

IN mine timbering it is calculated that square timbers are about one-fourth stronger than round ones of the same diameter. The safe load of a timber column is 600 pounds per square inch for heights less than 20 feet. Freshly-cut timbers are from 25% to 40% weaker than when seasoned.

STEEL is used to a limited extent for "timbering" in American mines, mostly in Eastern anthracite collieries, and to a very limited extent in Colorado. The cheapness of wood and freight rates tend to indefinitely defer any likelihood of its use in Western metal mines for many years to come.

OF Straits tin about 550,000 tons have been exported during the last fifteen years, almost wholly from placer deposits. Perax produces about 22,000 tons and Selangor 15,000 tons annually. The supply seems inexhaustible. Tin has been discovered in commercial quantities in New South Wales and Tasmania.

THE bonnets of large valves are usually held on with bolts, hence are easily removed, but small ones sometimes cause trouble, as the brass is soft, so that when an attempt is made to remove them the wrench rounds the corners off without removing the bonnets. The largest available wrench should always be used for such work, because a small one will spring and damage the bonnet

more than a large one. Screw the jaws up as tight as possible, then strike the handle a smart blow with the hand or a mallet.

IT is difficult to state with even any approximate correctness the relative dissolving powers of different gold solvent solutions. In a general way it may be put this way: Chlorine, 1% solution, 1½ hours, 4.49%; bromine, 1% solution, 1½ hours, 6.46%; cyanide, 1% solution, 1½ hours, 0.57%—60° C. in each case.

THE St. Davids Gold & Copper Co., Ltd., is the only gold mine now being worked in Great Britain. In 1901 the company worked 15,503 tons ore, yielding 5533 ounces hulsion, which gave \$95,649. The concentrates were valued at \$2915—a total of \$6.35 per ton. The total expenses for the year were \$31,854.

IN the Oregon case mentioned, there is a manifest property right in the trade name used, and is not to be traded upon or used by any unscrupulous rival. If of sufficient importance to warrant the expense, an appeal to a court of competent jurisdiction would afford protection against the fraudulent competitor.

SOME commercial potassium cyanide contains impurities, especially sodium compounds. The U. S. Board of Appraisers, at their last examination to determine the duty on the imported article, examined eighty samples; of these, fifty contained no sodium cyanide; the other thirty contained from 10% to 54% sodium salt—an average of about 22%. The duty on potassium cyanide is 12½%.

CHEMICAL HARD LEAD is a specific term to designate a certain kind produced mostly from lead ore containing no silver. It withstands the action of acids, and costs a little more than ordinary lead. It contains a small percentage of copper or antimony and is mostly used in sheet and pipe manufacture. A recent patent for its preparation gives an alloy of lead with 0.1% to 0.5% copper and 0.1% to 0.3% antimony.

TO TURN blue prints to a rich brown color, a piece of caustic soda about the size of a bean is dissolved in five ounces of water and the blue print immersed in it, in which it will take an orange yellow color. When the blue has entirely left the print, it should be washed thoroughly and immersed in a bath composed of eight ounces of water, in which has been dissolved a heaping teaspoonful of tannic acid. The prints in this bath will assume a brown color that may be carried to almost any tone, after which they must again be thoroughly washed and allowed to dry.

THERE are several methods of rendering paper transparent. Coat white paper with a solution of Irish moss in water, to which a slight quantity of previously dissolved gelatine has been added. It should be applied hot to the paper. When colors are desired, they must be transparent; they must be ground in varnish, and a stronger varnish is required than for opaque colors. A fine yellow may be produced by using yellow lake and red sienna. These make a warmer color than the yellow lake alone. If cost is no objection, auramine may be used. For pale red, madder lakes should be employed.

STRONG Portland cement is heavy, weighing 112 pounds per bushel. Weak cement is light. Strong cement is of a greenish gray color and sets slowly. Weak cement is of a brownish color, has too much clay in it, and sets quickly. The longer it is in setting the more its strength increases. The cleaner and sharper the sand, and the stiffer it is gauged, i. e., the less water used in working it up, the better. Salt water is as good for mixing with Portland cement as fresh water. It is of the greatest importance that the bricks or stone with which the cement is used should be thoroughly soaked with water. If under water in a quiescent state, the cement will be stronger than out of water. Whatever concrete is employed under water, care must be taken that the water is still; otherwise a current will carry away the cement and leave only the clean aggregate.

DYNAMITE is composed of nitro-glycerine and a dry substance called the absorbent. In its manufacture the nitro-glycerine is made first, which is prepared by the action of a mixture of concentrated nitric and sulphuric acids upon glycerine, introduced drop by drop. The nitro-glycerine is introduced into a large tank arrangement which is filled with the absorbent—a form of powder made up of wood meal and nitrate of soda. As a result of this absorbing process dynamite is obtained. The substance very closely resembles brown sugar in appearance. Then the dynamite is made into cartridges or sticks. The cartridges are cylindrical in shape and are generally 8 inches long, 1½ inches in diameter, and weigh half a pound each. The outer coating of the stick is of heavy waxed paper. In fact, a cartridge is simply a cylinder of this waxed paper tightly packed with dynamite. Before dynamite will explode from heat the temperature must rise to 350°.

IN electrolytic copper refining the copper alloy or blister copper is cast into slabs which are used as anodes in a bath containing a slightly acidulated solution of copper sulphate. The electrolyte is kept in continuous circulation. Pure copper is deposited from the solution upon pure copper cathodes at a current density of from fifteen to twenty-five amperes per square yard. Copper is simultaneously dissolved at the anode, and the alloyed gold, silver and other metals drop as slime to the bottom of the cell, to be parted and recovered later. After deposition the cathodes are melted up, poled and cast into wire-bars or other suitable forms. The poling

of copper consists in stirring the molten metal with a pine stick. The stick carbonizes, and, as a result, reduces cuprous oxide which is present in the molten copper. Upon cooling, cuprous oxide gives up its oxygen to metallic impurities which may be present in the copper. As the mechanical and electrical properties of the copper are better when impurities exist in the form of oxides rather than as metals, the proper amount of poling is when just sufficient cuprous oxide is left to oxidize the impurities. Overpoled or underpoled copper is brittle and of inferior conductivity.

IN smelting lead ores rich in zinc in a blast furnace H. E. Fry first calcines the sulphide ores so as to eliminate the greater part of the sulphur; he then mixes sulphate of soda and oxide of iron thoroughly with the calcined ore, briquetting the compound, the resulting briquettes then smelted in an ordinary cupola or blast furnace, the lead, silver and gold being obtained in metallic form, the zinc passing into the slag or residue, from which it is recovered as oxide of zinc. The sulphate of soda facilitates the smelting of the ore; the recovery of the lead and silver is stated to be satisfactory; that of the zinc is nearly 70%. The Collins process for extracting zinc and copper from their ores uses "niter cake," a product resulting from the manufacture of nitric acid. This substance is composed of sulphate of sodium, 75.80%; free sulphuric acid, 16.68%; water, 6%; insoluble matter, 1.52%. While the strength of the solution may be varied according to the character of the ore to be treated, a saturated solution is generally used. The process consists in immersing the zinc or copper ore roasted or otherwise, in a powdered state, in a bath of water in which more or less of the niter cake is held in solution, and in subjecting the powdered ore to the action of this solution, until all the copper or zinc present is dissolved out and extracted from the ore. The bath is then filtered to remove the residual ore and the copper or zinc electrically deposited from the solution or otherwise precipitated as may be preferred.

APPARATUS for making blue prints by electric light is now common. There is a vertical glass cylinder, 3 feet in diameter 5 feet high, mounted on a revolving base, so that it may be rotated about a fixed center, and thus facilitate the loading and unloading operations. On this center line, and over the cylinder, there is an electric arc lamp of 1100 watts capacity, which may be made to gradually descend through the center of the cylinder to the floor, by means of an escapement mechanism and a system of pulleys. The glass cylinder is made in halves and held together by brass bands, top and bottom. For the purpose of printing, the tracing to be reproduced is laid on sensitized paper and both are wrapped around the cylinder with the tracing next to the glass. The upright at one of the joints in the glass carries some horizontal flat steel springs, to the ends of which vertical strips of wood are attached, which act as clamps to hold the first edge of the tracing and sensitized paper. The tracing and printing paper are held in place by a fabric curtain, one vertical edge of which is permanently secured to the upright at one of the joints in the glass. To the free edges of the canvas are attached, by tension springs, a number of hooks which hook over a metal rod on the upright at the opposite joint in the glass. The spring hooks insure an even pressure everywhere and give the best conditions for securing contact. Tracings that have been folded and badly creased can, with a little care, be made to come down to excellent contact. The arc lamp is then lowered slowly, the center of light coinciding with the axis of the cylinder, so as to maintain a uniform intensity of light at all points of the tracing on a level with the arc. As the light descends through a distance corresponding to the height of the tracing all parts of the sensitized paper are equally affected.

HOMOGENEOUS metallic lead is deposited from slightly acid concentrated solutions of lead nitrate or acetate, containing, for preference, considerable quantities of the corresponding alkali salts, by a current of about .024 ampere per square inch at the cathode. It appears that when an anode of lead is used, the electro-motive force is about 0.1 volt. When the conditions are such that lead hydroxide can be formed at the cathode, spongy lead is deposited. Concentrated solutions of lead or alkali salts dissolve considerable quantities of lead hydroxide; when such a solution is electrolyzed, the removal of lead from the layer of solution in contact with the cathode dilutes it. This more dilute solution deposits the lead hydroxide or basic lead salt which it contains on the cathode, and so prevents the regular deposition of the metal, giving rise to the spongy deposit. Lead chloride and sulphate give unsatisfactory results, owing largely to the formation of insoluble lead chloride or peroxide at the lead anode. By using very small current densities and electro-motive forces, it is, however, possible to obtain coherent deposits. The deposition of lead may be utilized for plating objects with lead or for separating lead and silver, the alloy being used at anode in a solution of nitrate saturated with chloride; the silver remains behind undissolved. Coherent deposits of lead are also obtained, although with more difficulty, from alkaline solutions. The concentration of the lead ions is so small in these solutions that the liquid surrounding the cathode soon becomes so impoverished that the electro-motive force rises, and the next available cation (an alkali metal) is discharged. This results in the secondary reduction of lead sponge. By keeping the electro-motive force low, and replacing the liquid in contact with the cathode by vigorous stirring, however, good deposits may be obtained.

Direct Cyaniding of Wet-Crushed Ores in New Zealand.*

By HAMILTON WINGATE, B.Sc., Auckland, N. Z.

Until recently, the universal practice in New Zealand was dry crushing and direct cyaniding. With ores containing no mineral sulphides, and little or no coarse gold, this method, in spite of its many disadvantages, gave excellent results, and was by far the best available one, pending the solution of the slimes problem. But the situation has now been changed. The successful treatment of the slimes, enabling the mines not only to do away with dry crushing, but also to deal with the mineralized ores of the lower levels, which are, for obvious reasons, quite unsuited to that method of treatment, has made wet crushing universal; and this may be taken as satisfactory proof of its superiority over the former practice.

In the lack of accurate information from plants operating successfully, particulars of experimental trials carried out on a working scale at the Waitekauri Extended mine, Maratoto, N. Z., while the writer was in charge of the cyanide works, may be interesting to members of the Institute.

At this mine the usual method of kiln drying, dry crushing and subsequent cyaniding, for which the plant had been specially designed, was the system in vogue; but while the extraction was high, the working costs were heavy; and the treatment, though applicable to the oxidized surface ores, was not suited to those of deeper levels. The ore being, moreover, of low grade, a change of treatment became imperative. The experiments here described were consequently made after such alterations in the plant as was necessary and practicable.

The choice of a satisfactory process depended on the successful treatment of the slimes, which formed a large proportion of the ores crushed, and, as was subsequently discovered, also contained the larger part of the total value. The use of lime, successfully introduced on the Rand by Mr. Williams, was found to satisfy this condition; and the results, in view of the somewhat refractory nature of the ore, are interesting.

NATURE OF THE ORE.—The ore is an extremely hard, flinty, bluish quartz, intermixed with finely divided iron pyrites, the gold contents being pretty uniformly distributed in an excessively fine state of division, and silver being present as sulphide. Analysis showed the quartz to contain 5% of iron pyrites, with traces of calcium and manganese, the average value being from 6 to 8 dwt. of gold and 1 oz. 15 dwt. of silver per ton of 2240 pounds. The high cost for shoes and dies, as shown in the table of working expenses below, will convey some idea of the very hard nature of the ore, which, owing to the fine state of division of the gold, had to be crushed through a 40-mesh screen in order to secure an adequate extraction. A prolonged amalgamation test on a large amount of ore gave a very small percentage of the total hullion contents. This being the case, and as the ore carried no visible gold, any attempt at amalgamation was discarded.

The association of the gold and silver contents with the mineral sulphides of the ore is shown by the two following experiments:

A. Seventy-two pounds of blanketings, obtained from 7.5 tons of ore, crushed through a 40-mesh screen, assayed as follows per ton:

	Oz.	Dwt.	Gr.
Gold.....	1	11	0
Silver.....	3	8	14

B. Clean mineral, obtained from the concentration of a large tonnage of slimes in the main slimes launder, assayed as follows per ton:

	Oz.	Dwt.	Oz.
Gold.....	4	18	0
Silver.....	10	12	8

This raised the question whether concentration would be necessary; but after experiments, both in the laboratory and on a working scale, it was decided to classify the pulp into two classes only, namely, sands and slimes.

The largest proportion of the mineral sulphides in the ore crushed to slimes. This accounts for the higher value of the hullion contents of the slimes as compared with the sands.

After cyanide treatment of the sands, average samples of clean mineral, obtained by concentration from the residues, assayed as follows per ton:

	Oz.	Dwt.	Gr.
Gold.....	0	4	21
Silver.....	1	6	2

This shows a high extraction from the contained mineral sulphides. In experimenting on the mineral concentrates in the laboratory it was not found possible, even by using a solution of higher strength, to get the residues below 4 dwt. per ton in gold without first crushing them finer.

With reference to the mineral contents of the slimes one of the initial difficulties was the tendency of the mineral sulphides to separate out during agitation and settle on the bottom of the vat. These assayed as follows per ton:

Before treatment:

	Oz.	Dwt.	Gr.
Gold.....	1	7	18
Silver.....	5	9	10

After treatment:

	Oz.	Dwt.	Gr.
Gold.....	0	9	18
Silver.....	2	17	4

Experiments showed that the poor extraction was due to want of proper agitation. It is essential that the agitators be so constructed that when in motion they will sweep the bottom of the vat perfectly clean. The agitator adopted consists of a central revolving shaft, which can be raised or lowered as required, and carries two parallel fixed wooden arms, set 3 feet apart, the lower arm reaching within 9 inches of the bottom of the vat. Holes are bored through the arms at regular intervals of 6 inches, and wire rope (some old $\frac{1}{2}$ -inch aerial cable being used), cut into 5.5-foot lengths, was passed through them and keyed into position, the ends next the bottom of the vat being teased out so as to act as a sweeper.

This was an effective agitator. The assays of the mineralized portion of the slime residues, in two successive charges, were as follows per ton:

Charge No. 1:

	Oz.	Dwt.	Gr.
Gold.....	0	2	10
Silver.....	1	6	2

Charge No. 2:

	Oz.	Dwt.	Gr.
Gold.....	0	2	0
Silver.....	1	2	10

These results show a good extraction from the contained sulphides.

GENERAL DESCRIPTION OF THE TREATMENT.—The mortar boxes which had the double discharge for dry crushing were altered to single discharge for wet crushing; but even after this change were obviously unsuited to the work. This fact, no doubt, increased the percentage of slimes; but it was found in actual practice much easier to get a good extraction from the slimes than from the sands. A number of sizing tests on the sand residues showed that the greater part of the gold which they retained was in finely divided form in the coarser quartz particles.

The ore was crushed through a 40-mesh screen. The classification of 656 tons crushed gave 355 tons, or 54.11% of sand, and 301 tons, or 45.89% of slimes. A sizing test of the sands taken through this period gave the following:

Mesh.	Through.	On.	Per Cent.
40.....	50.....	6.9	
50.....	60.....	9.4	
60.....	70.....	27.5	
70.....	80.....	8.7	
80.....	90.....	29.4	
90.....	100.....	1.9	
100.....	Loss.....	15.0	
		1.2	
		100.0	

It thus appears that, taking the sands and slimes together, 70% of the pulp, on an average, was crushed fine enough to pass through the 80-mesh sieve, this being the fineness, as determined by experiment, requisite for a good extraction.

The crushed pulp passed direct from the mill to a spitzkasten, 5 feet square at the top, coming to a point 5 feet deep, and provided with a 2.5-inch cock at the apex to regulate the discharge of the sand pulp. A rose, connected with a 1.5-inch high pressure pipe, is passed down the center of the spitzkasten to within a few inches of the bottom, the inclined sides only of the rose being perforated. When the spitzkasten is at work, this throws an upward spray of water under pressure.

The success of the treatment depends largely on good classification, since any slimes carried over with the sands are apt to be lost in the overflow from the sand vats; while, on the other hand, any fine sands present in the slimes will cause a portion of the slime pulp to set hard at the bottom of the vat in a mass too tough to be affected by the agitator. There is in this case a consequent loss in the ultimate cyaniding through non-treatment. It was only on the addition of the rose to the spitzkasten that a satisfactory separation was obtained.

The resulting products were treated quite separately. The discharge from the spitzkasten passed to a sand vat, where it was discharged through a Butters distributor; and the overflow of the spitzkasten, constituting the corresponding slime charge, passed to one of the agitator vats.

TREATMENT OF THE SANDS.—The average charge was thirty tons, the vats being circular, 20 feet in diameter and 4 feet deep. The sands were treated in the ordinary way, after a preliminary alkaline wash according to requirements, followed by a wash from the "No. 2 weak" sump, in order to reduce the initial consumption of cyanide on the first contact of the strong solution with the ore. A 0.5% solution of cyanide for the dissolution of the gold and silver contents was followed by the usual washes from the strong and weak sumps, with a final water wash to displace the cyanide solution. The sands being a perfectly clean, uniformly leachable product, quite free from slimes, presented no special difficulties in treatment.

TREATMENT OF THE SLIMES.—The slime vats were circular, 22 feet in diameter and 7 feet deep, and the average charge (corresponding to a 30-ton charge of sands) was twenty-five tons of slime per vat. The overflow from the spitzkasten being carefully run in at one end of the vat, the clear liquid was allowed to flow away at the other; and when the vat had been charged the slimes were allowed to settle and the water was drained off by means of an inside syphon pipe, leaving a pulp which contained, after draining, from 42% to 58% of dry slimes. The agitator was now started, being at the same time gradually lowered. The value of the charge was ascertained by means of dip samples, taken during agitation, which we found to give most accurately the value of the total hullion contents. Lime was now added in sufficient quantity to coagulate the slimes (fourteen pounds per ton of dry slimes being the average amount required), and the charge was agitated for an hour to neutralize the effects of the free acid and other "cyanicides" present in the ore.

In order to economize cyanide and prevent the volume of the sump solutions from becoming unmanageable (our sump accommodation, during these experiments, being limited), the amount of dry slimes and of water in the pulp was carefully estimated in the sample of the slimes charge, and the required amount of cyanide, dissolved in five tons of No. 1 "strong sump," was added, in order to bring up the total solution present in the charge to 0.16% of cyanide. This strength of solution, found in actual practice necessary for the effective solution of the gold and silver, was higher than the preliminary laboratory experiments had indicated. These, however, were not made under exactly similar conditions. The charge of slimes pulp, which occupied a depth of from 3 feet to 4 feet in the vat, was now agitated at the rate of forty revolutions per minute for three hours (the time necessary to obtain a satisfactory solution of the hullion contents); solution from No. 1 strong slimes sump was then pumped on, and agitation was continued until the slimes charge was complete, the pulp now occupying a total depth of 6.5 feet. The agitator was now raised and the slimes allowed to settle, after which decantation began.

The arrangement for drawing off the cyanide liquors consisted of a 2-inch wired rubber hose, fixed inside the vat, and connected at the bottom and close to the side of the vat with the solution pipe to the extractor boxes. The end of the hose is held firmly in an iron collar, to which is attached an arm of $\frac{1}{2}$ -inch square iron. This arm passes through a guide, which can be moved freely along a $1\frac{1}{2}$ by $\frac{3}{4}$ -inch iron bar, 3 feet long, which is bolted to the inside edge of the top of the vat. A thumbscrew through the guide holds the arm in position; and, as the hose is lowered, the guide can be moved along the fixed iron bar and the arm securely clamped. When not in use the arm is raised and clamped, and the hose, being drawn up close to the side of the vat, is clear of the agitator.

Since there was no intermediate storage tank, and the solutions had to be drawn off direct from the vats to the extractor boxes, this was found to be the safest arrangement. Care was taken not to set the mouth of the hose too close to the level of the slimes, as on draining off, the pressure of the top solution being removed, they rise. Automatic floats were found unsatisfactory, as they were both difficult to adjust and required a considerable amount of watching; while, with the arrangement described, once the hose pipe is properly set, it only requires lowering occasionally, and there is no risk that slimes will pass along with the liquors into the extractor boxes. After drawing off the first wash, agitation with sump solutions, followed by decantation, was continued, until a satisfactory extraction was obtained. Additional lime was added, if required; but the preliminary coagulation was usually sufficient.

From four to eight washes was required, according to the size of the charge and the nature of the slimes pulp, which was at some time more hunky than at others. The total weight of the washes required was from three to four times that of dry slimes present in the charge.

Each wash was in every case passed through the extractor boxes before being returned to the slime vats. The precipitation was satisfactory even in the most dilute solutions. The rate of flow through the extractors was regulated to two tons of solution per hour per cubic foot of zinc shavings.

The following is a summary of the results obtained during the experiments, on a working scale, upon 1440 tons of different classes of ore, taken from the mineralized portion of the reef at the lower levels.

SUMMARY OF WORKING RESULTS.—REPORT No. 1.—During the period from August 27 to October 4, 1900, quartz from the north end of the Low level only was crushed, the ore being, as already described, extremely hard, and containing 5% of finely divided iron pyrites. The amount of ore crushed was 656.1 tons.

CLASSIFICATION.—The separation by the spitzkasten was as follows:

355 tons passed to the sand vats = 54.11%.
301.1 tons passed to the slimes vats = 45.89%.

656.1 tons.

The total gold was divided as follows: In the sands,

46.9% in the slimes, 53.1%. Of the total silver, 41.28% was in the sands and 58.72% in the slimes.

EXTRACTION.—The following tables show the extraction:

GOLD.														
	Tons of 2240 lbs.	Total Gold.			Gold Per Ton.			Gold in Residues.			Gold Per Ton.			Percent- age Extrac- tion.
		Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	
		107	9	21	6	1	25	8	13	1	10	76.55
Sands.....	355	121	13	23	8	2	17	1	18	1	3	86.08
Slimes.....	301.1													
Total...	656.1	229	2	20	6	23	42	10	7	1	7	81.43
SILVER.														
	Tons of 2240 lbs.	Total Silver.			Silver Per Ton.			Silver in Residues.			Silver Per Ton.			Percent- age Extrac- tion.
		Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	
		477	12	8	1	6	21	262	3	20	14	18	45.11
Sands.....	355	679	3	22	2	5	3	375	2	8	1	22	44.78
Slimes.....	301.1													
Total...	656.1	1156	16	6	1	15	6	637	6	4	19	19	45.03

the actual hullion yield to be about 3% lower than that indicated by assay.

EXTRACTION.—The following tables show the extraction:

GOLD.														
	Tons of 2240 lbs.	Total Gold.			Gold Per Ton.			Gold in Residues.			Gold Per Ton.			Percent- age Extraction.
		Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.

		Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	Oz.	Dwt.	Gr.	
Sands.....	393	526	7	9	1	6	18	291	1	17	14	19	44.7
Slimes.....	390.8	831	19	15	2	2	13	515	18	3	1	6	9	38.0
Total..	783.8	1358	7	0	1	14	15	806	19	20	1	0	14	41.2

WORKING COSTS.—The working costs for milling and cyaniding are included in the cost sheet for the total 1440 tons treated.

REPORT No. 2.—During the period from October 4 to November 22, 1900, two different classes of ore were crushed, namely:

I. 467.9 tons from the north end of the Low level, the nature of the ore being similar to that dealt with in the last report, and having an average value of £1 10s. 10d. per ton.

CLASSIFICATION:

245 tons passed to the sands vats = 52.34%.
222.9 tons passed to the slimes vats = 47.66%.

II. 315.9 tons from the south end of the Low level, the nature of the ore being much softer, more mineralized, and showing a greater tendency to crush to slimes, and having an average value of £2 3s. 9d. per ton.

CLASSIFICATION:

148 tons passed to the sands vats = 46.86%.
167.9 tons passed to the slimes vats = 53.14%.

The classification for the total 788.8 tons of ore crushed was as follows:

393 tons passed to the sands vats = 50.26%.
398.8 tons passed to the slimes vats = 49.74%.

783.8 tons.

Of the total gold, 46.9% was in the sands and 53.1% in the slimes.

Of the total silver, 38.8% was in the sands and 61.2% in the slimes.

It will be noticed that the extraction during this period was lower than that shown in Report No. 1. In the case of the sands this was found to be due to the retention of a larger proportion of the gold in the coarser quartz particles, owing to the richer nature of the ore from the south end. In the case of the slimes, the unexpectedly increased quantity to be dealt with, and the more highly mineralized nature of the ore, made this product more difficult to treat. The lower extraction of silver, which is intimately associated with the contained mineral sulphides, as compared with the sands extraction, was due to imperfect agitation, owing to the increased amount of slimes produced from the south end ore, which contained a greater proportion of associated mineral sulphides.

The crushed ore was sampled before entering the spitzkasten, as a check against the sands and slimes samples. All the sands and headings samples were ground in a Park-Lacy fine crusher to an impalpable powder before assay. The final cleanup showed

WORKING COSTS.—The working costs for both periods under review, during which a total of 1440 tons of ore were treated, are embodied in the following table. Water power is in use at this mill, but owing to a shortage, due to dry weather, the item for wages is higher than would otherwise have been the case; because, during a part of the time, it was possible to run only ten stamps out of the total number of twenty which had been altered for wet crushing.

COST OF TREATMENT OF 1400 TONS OF ORE.

	S.	D.
Cyanide, 2.7 pounds per ton.....	3	4½
Zinc, .75 pounds per ton.....	0	4½
Caustic soda, .75 pounds per ton.....	0	1½
Lime, 7 pounds per ton.....	0	2½
Milling and cyaniding wages.....	2	5
Filter cloths.....	0	0½
Screens.....	0	0½
Shoes and dies.....	0	6
Oils.....	0	1½
Assaying and melting.....	0	7
Management.....	0	7½
Sundries, including royalty.....	0	3
Total cost per ton of 2240 pounds.....	8	7½

The necessity of using stronger solutions, owing to the nature of the ore, and in order to obtain an adequate extraction of the silver (which is an important part of the total hullion value), makes the consumption of cyanide on these ores a good deal higher than the general average.

CONCLUSIONS.—In view of the foregoing results it is doubtful if the higher extraction which could be obtained by concentrating out and treating separately the mineral sulphides from both sands and slimes would compensate for the extra working costs which such a treatment would involve—to say nothing of the initial expenditure which would be necessary. Otherwise, this would seem at first sight to be the ideal method of treating such an ore. Several of the mills here crush with a cyanide solution of about 0.1%, thus obtaining a rapid solution of the hullion contents during crushing, sometimes amounting to as much as 60% of the total value of the ore; but owing to the difficulty of preventing a large consumption of cyanide when the ore is mineralized, this method of treatment was not tried in the case here discussed.

THE Consolidated Copper Co. of Virginia has incorporated at Pierre, S. D., under the laws of that State. Of its six incorporators, four are New York men. It is asserted that the new concern with such pretentious capital is formed to compete with the

Amalgamated Copper Trust, and that it represents the Heinze and the Boston interests in copper. F. Bien, the chief incorporator, is attorney for the defendants in the litigation of E. R. Morse, the Boston millionaire and once head of the copper trust, and the Boston & Montana Ore Purchasing Co.

The Silver King Concentrating Mill, Park City, Utah.*

Written for the MINING AND SCIENTIFIC PRESS by
JAMES H. STEELE, E. M.

This mill, which handles the lower grade ores from the great Silver King mine, has now been in operation about three years. After a two weeks' unsuccessful run as first built, the mill was closed down and very extensively remodeled. Many additions and changes have since been made to bring it up to its present form.

The mill has a capacity of about 100 tons in ten hours, and at present is being run nineteen hours out of every twenty-four.

The ores treated carry about 15% lead, twenty ounces silver and small amounts of gold. The lead occurs both as a sulphide and as a carbonate; the silver occurs associated with the galena and also as a chloride. The carbonates and chlorides, which slime very badly, constitute the difficult feature in the successful concentration of the ore. The gangue material is principally quartzite, with some lime.

The crude ore is stored in bins having a capacity of 2000 tons, from whence it is drawn into a car by one man on each shift and dumped over a grizzly, the oversize going through a 10x7 jaw crusher which reduces it to about walnut size.

From the bin under the grizzlies the ore is fed automatically by a plunger feeder into a trommel having ½-inch punched screens, and then to a pair of 12"x30" belt-driven rolls. The product from the rolls, together with the unders from the screen, is elevated and again screened in ½-inch trommel; the overs are returned to the rolls for recrushing, while the unders pass on to be screened to the size for jigging.

In describing the process of concentration, we may, for convenience, divide the mill into three parts—the coarse concentrating department, the fine concentrating department and the slime and dryer department.

The jig, or coarse concentrating department, is built in duplicate, only one-half being run at a time. It is so arranged that with very little work, changing the launders, etc., parts of one-half may be made work with parts of the other half, thereby saving shut-downs for repairs.

The ore is sized for jigging by a set of three revolving screens. The first screen has ⅜" holes and the overs are treated on two double-compartment Hartz jigs. These jigs make 140 1" strokes per minute. They are fitted with a side discharge, all of the other jigs having the regular bottom discharge. The second screen has ⅝" holes, and the corresponding jig makes 180 ⅔" strokes per minute. The third screen has ¾" holes and the jig a stroke of ⅓", making 240 per minute.

The unders, or fines, from the third sizing screen are settled in a small hydraulic sizer, and the spigot product from this tank is jigged on machines having a stroke of ⅓" and 270 per minute. The overflow from the tank contains in suspension in the water a greater portion of the slimes and is sent to the slime department.

The tailings from the first and second sets of jigs are wasted; those from the others are recrushed and made ready for the fine concentrating department. These tailings are first elevated to a small bin in which a paddlewheel slowly revolves and pushes the coarse particles over the side into a second bin, from which the Huntington mills are fed. The slime water runs off in the opposite direction and is sent to the storage tanks in the slime department.

At the head of the fine concentrating department is a battery of four 5-foot Huntington mills wherein the jig tailings are crushed to pass through a diagonal slotted screen equal to about 25-mesh. As a general thing, two of the mills are sufficient to handle all of the tailings that are re-treated. There is an overhead track with crawl and chainlocks, so that the mills may be easily picked up and run into the machine shop for repairs.

The pulp from the Huntingtons is elevated and sent to a V-shaped hydraulic classifier, about 60' long, situated above the concentrating tables. The coarse product from the first compartment is treated on six Wilfley tables and the fine stuff from the last compartments is treated on four Frue vanners.

An Overstrom diagonal table has been installed, but it is yet too early to make any statement as to its performance. When rich enough to pay, the Wilfley slimes are saved and filtered.

Next in order comes the slime department. Here canvas tables and other settling devices have been unsuccessfully tried on these flourlike slimes. A complete new slime plant has been recently installed. It consists of a 40 H. P. Ingersoll-Sergeant air compressor, three large steel mud and air receivers and two 48-chamber filter presses. These presses run

*See illustrations front page.

about fifteen tons each of slime in twenty-four hours. One man on each shift looks after the presses and compressor, the latter running only about one-third of the time.

The slime water which has been taken from the ore at various points in the process is divided up among seven V-shaped settling tanks, 5' high by 5' wide and 40' feet long. The flow through them is very slow and the water comes off almost perfectly clear. The thick mud is tapped at the bottom through molasses gates and elevated to a storage tank over the filter presses. It is run through the receiver into the press until the latter is full and the former nearly so. Ninety pounds of compressed air are then used to force the remainder of the mud into the presses and the water out through the canvas. The water leaves the presses absolutely clear. About 22% moisture remains in the slimes after pressing. The slimes average in value about 15% lead, twenty-five ounces silver and \$2 gold per ton.

In order to sample the mill concentrates and slimes in the company's new automatic sampler, they must be dried to about 3% to 5% moisture. This is being done in a Cummmer revolving drier. The cylinder of the drier is 48" diameter by 25' long and can be made to revolve at two different speeds necessary for the different materials dried. The dust is collected in two hopper-bottomed chambers, one at the top and one at the side of the cylinder. The slimes are put through a chopping machine before drying, and the dust is fed into this machine with the slime cakes to keep the knives clear and to prevent the pieces of slime from sticking together again on their way to the dryer. The dry product is sent to the bin to be hoisted to the sampler.

Power for the mill is furnished by a 200 H. P. cross-compound Corliss engine. An auxiliary 125 H. P. tandem-compound engine drives a 500-lamp generator which furnishes light for the entire plant. The two boilers are fed by two American stokers, the coal being fed into the stokers from a pocket in the roof.

A close check is kept on the mill work; from twenty to thirty samples from all parts of the mill are assayed daily. The heads and tails are sampled by means of an automatic sampler. In the case of the heads the sampler is placed after the second screen, before any water has been added to the ore. The launder carrying the stream of ore is broken, allowing the latter to fall through an open space. A shallow pan, mounted on a trolley, is made to pass through the stream, diverting its entire volume to a second launder for a short space of time—probably four seconds—and at whatever intervals of time necessary for accurate sampling, the latter depending upon the mesh of the ore. The operating mechanism of the sampler consists of a water box 6' long, 8' wide and 8' high, having one compartment on each side of the center where the box is pivoted. The box can be fixed either over or under the sampler. A rope from each end of the box connects with the trolley. A small stream of water is made to fill one side of the box, causing it to tip and slowly empty and draw the sample pan through the stream of ore. As the box tips the other compartment is brought under the water jet and the machine is ready for a similar operation in the opposite direction.

A sample is taken every two hours. One thousand grams are taken out and weighed, dried over night, reweighed and the moisture calculated. These samples are thoroughly mixed and cut down by means of rifles for the assay sample.

The tailings are sampled by a similar device. In this case, however, a smaller sample is taken every fifteen minutes, which is run into a pointed canvas bag to drain.

The ratio of concentration is three tons into one.

SUNLIGHT is a variable quantity. Outside the atmosphere the sun would appear conspicuously blue. On the meridian the sun gives light that is white; but, as it declines, the atmosphere steadily filters out the blue and violet until by the middle of the afternoon the entire blue end of the spectrum is down to about half its previous intensity, while the general luminosity has fallen only about 20%. The general color tone is then distinctly yellowish white, and still later in the day when the sun is only a few degrees from the horizon, the blue contingent is practically wiped out, and the light shades off from orange yellow to orange red.

THE illustrated article in the issue of Sept. 27th, showing the novel use of a rock drill as a steam hammer in Colorado, elicits a statement of a rock drill mounted on a platform to drill horizontal holes in granite sills of windows in the United States Treasury Building, Washington, D. C., and also for similar use in that city for drilling out brick.

Power Required for Isothermal Compression.

Written for the MINING AND SCIENTIFIC PRESS by D. E. BIGELOW.

Illustrating the use of the graphic table shown on this page, let us suppose 1600 cubic feet of free air per minute at sea level (60° F. and 14.7 pounds absolute) is to be compressed to seventy pounds gauge pressure: Follow the line indicating 1600 cubic feet up to its intersection with the diagonal line representing seventy pounds gauge, and note the horizontal line cutting this point. Follow this line to the left margin of the diagram, where it will be found to indicate 180 H. P., which is the power required for compressing 1600 cubic feet free air per minute to seventy pounds gauge, with the air at a constant temperature (60° F.) and with no allowance for losses of any kind.

These conditions are theoretical. In practice, an additional amount of power is required above that shown by the diagram, varying with the temperature of the air and character of the compressor. Additional power will be required, first, to overcome the friction of the moving parts; second, to draw the air into the compressor; third, to overcome the expansion of the air due to its being heated by the compressor. That is, it is impossible with any compressor now known to maintain the air at a constant temperature during compression. The air is expanded by this heat, and its pressure increased until, after leaving the compressor, its volume is reduced as the temperature is reduced to that required. This loss is minimized by two-stage compression, having efficient intercoolers. The combined loss of power from these causes is rarely less than 10%, varying from that to 40%.

The temperature of the air has also to do with the power required. As compared with the table, more power will be required if the temperature is above 60° F. and less power if below, amounting to about 1% for each 5° difference in temperature. Atmospheric air is denser at the sea level than at an altitude, hence a compressor working at an elevation

can be compressed at any altitude may be determined and compared with sea level conditions.

The History of a Catalogue.

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. H. FITCH.

Britain is a tight little island, and its history begins when people came there and began doing things. America was discovered by the people who use dictionaries, and they began to make its history. But where does the history of France begin? It had an indeterminate beginning. What changing boundaries of territory, what gradual emergence of power from weakness, what mergers of dialect into language took place! Finally, there is the nation, an unquestionable unified fact, by whatever gradual process it may have come to be.

In writing the history of a catalogue we have a subject which is not only as indefinite as France in its beginnings, but one which remains indefinite, which has not arrived at any strong definable character. My idea of what a catalogue should be is so far removed from what catalogues are that I might hesitate to advance it were the subject better defined, but I will let it serve for one idea of a catalogue.

After a manufacture has been established it is necessary to give inquirers a catalogue, properly speaking, of the products of manufacture. To convey information necessary to be known in the course of business is the object. "A straight tale speeds best being plainly told," and simple form, correct specification and full information make such a catalogue admirable for its purpose. This full information should include prices, without which a catalogue is as incomplete as a shipping manifest presented to a man who wants an itemized bill.

I am a stickler for clear analysis—as clear in the details of business as it must be clear in the calculation of a bridge truss. But a bridge may be built and carry heavy loads without having this construction. It may be of a design called hasty, that cannot be

COMPRESSED AIR

THEORETICAL POWER REQUIRED FOR ISOTHERMAL COMPRESSION

NOTE: FOR SINGLE STAGE COMPRESSION ADD 20 TO 40%. FOR TWO STAGE COMPRESSION ADD 10 TO 30%.

VOLUME OF FREE AIR AT VARIOUS ALTITUDES COMPARED WITH QUANTITY AT SEA LEVEL—14.7 lbs. ABSOLUTE. COMPARATIVE POWER AT VARIOUS ALTITUDES

must expand a portion of each stroke in bringing the air to sea-level pressure.

Supposing the compressor to be located 5000 feet above sea level, it will have a less capacity than at sea level. To ascertain how much, follow the vertical line indicating 1600 cubic feet to the top line of the diagram. From there follow the density curve to its intersection with the horizontal line denoting 5000 feet altitude, and it will be seen that the 1300 cubic feet line intersects at this point, showing that the compressor which has a capacity of 1600 cubic feet at sea level has a capacity of but 1300 cubic feet at 5000 feet altitude.

It requires less power to compress the lighter air. To make the power correction for altitude in the above case, follow the horizontal line indicating 180 H. P. to the smaller diagram to the right side of table. Follow the diagonal from 180 down to its intersection with the 5000-foot vertical line, and note the horizontal line meeting at this point indicates 165 H. P., which is the power required to compress 1600 cubic feet free air at 5000 feet altitude to seventy pounds gauge, subject to correction for frictional and heat losses as shown above.

It will readily be seen that the table may be used as well in calculating the reverse problems—that is, starting with known power the amount of air which

well calculated for its stresses, and is not held in good repute by bridge engineers, and still stand up. Catalogues, as they are born and grow, are usually many purpose productions. They are not clean cut and suited to definite ends, but are vaguely designed and used.

The trade list or catalogue proper need not be hideous. It may be very handsome. I have at hand the last catalogue issued by the M. C. Bullock Co. before that company was merged with the Sullivan Co. It is a good example of a proper catalogue. Any one wanting diamond or rock drills can see at a glance that it is meaty, gives explicit information on equipment, details and prices—answers his questions in advance. Yet it is an elegant publication. The catalogue of the Clark hose coupling is quite a booklet, but it is all legitimate catalogue, showing a new device by many illustrations, and convincing a person (as far as pictures can do it) that the coupling is "quick as a wink" and reliable under trying applications. This is proper, but brevity and simplicity are strong points in such a catalogue.

A preacher who was caught breaking his own code of morals blandly assured his complaining flock that they should follow what he said and not what he did. If circumstances are at times too strong for the weak natures of those who preach religion and morals,

what can be expected of hirelings who have the nerve to preach ideal catalogues? Gen. Francis A. Walker remarked in one of his lectures on political economy that Italy had produced some of the best writers on finance because Italian finances had been so bad as to give them many wholesome lessons. If I am not a good writer on catalogues, it is not from any lack of experience with faulty ones. I have helped to bring out some that I would have cheerfully kicked over at the time, or in the light of later experience, but I did not want to be more nice than wise. Preach wisdom, I say, and be mindful of what light of truth you can get on a cloudy day; but if you attempt too sweeping an extinction of folly, you will be likely to find yourself standing alone and friendless, as roundly disliked as Joseph among his brethren.

The birth of the customary catalogue is in this wise: A man or company having built up a business by other advertising methods decides that it needs a catalogue to help maintain and increase the business. It is the advertising idea that prevails. Here there is a tremendous amount of delusion. Incidentally, a catalogue helps to hold trade just as good goods, prompt shipments and courteous attentions hold trade. It is in fact, properly speaking, an expanded letter of explanation to a man whose interest has been aroused, or whom you have found to need your goods. But it is an exceedingly ineffective and expensive means of reaching new and original business.

The idea which prevails in bringing out the catalogue is 10% information to customers to lighten the burden of correspondence. This I consider legitimate. It is 30% advertising, which is ineffective, or calls for a different type or means of publication. This leaves a main motive of 60%, which is the conceit of a man who wants to do something himself that he does not know how to do well, and is too timid to do openly. The dear thing about it is that it is his own, not that it is profitable for the extension of business, but that it exploits among rivals and friends a business institution behind which is a personality. For example, the former promoter of the Willans engine in America, a gifted engineer who desired and richly deserved the good opinion of his fraternity, published a handsome catalogue. He sent a copy to every member of every leading technical society. It was a creditable thing and I do not think he regretted the expense, but he told me that he did not trace a single sale to this distribution.

Where we know a party uses a product, and we send him a catalogue, it would appear to be a judicious thing. It sometimes is. But I know of one case of a manufacturer of an ingenious specialty in brewers' machinery who sent out 5000 catalogues in English, and over 1000 went abroad, largely to non-English speaking countries. Then he sat back and waited for something to happen. He had gone with a brewers' machine to a world of brewers. After a few months he figured up his responses: From America, none; from Hungary, a post card, probably from a competitor.

Now for the shyness of it. The personal note is a muffled one. I sometimes think it would be a more interesting world if it were less so. A gentleman much cleverer than ordinary once asked me to help him make a trade catalogue in which his portrait and an original poem by himself were to occupy the front cover. It was a good poem, too, as poems go, but I told him as tactfully as I knew how that it would contribute more to the "gaiety of nations" than to the sale of machines. I did that because I had been brought up in a timid atmosphere. I was wrong. I should have helped it along. I have helped worse things along.

The first chapter in the history of the catalogue is the plan of it, the idea of what it should be and accomplish. If we are after personal credit, trade advertisement and information to established customers in about the order stated, it is the first point in economy to reach these ends in the most effective way. The economy of production, cost of composition, illustration, printing and distribution of the catalogues will be reviewed in later articles. These are as the iron and tool work in a machine. It is not these, but the effectiveness of design of a machine for its purposes which determines whether it shall be valued in the shop or consigned to the scrap heap.

(TO BE CONTINUED.)

How to Save Life.

The following simplified method for the restoration of drowning persons, and of those whose have lost consciousness through asphyxia or any other cause, was developed by Dr. J. V. Laborde, of the School of Anthropology in Paris. It has proved efficacious in many cases. In one cited, of a child who had been submerged for nearly fifteen minutes, the return of breathing was accomplished in ten minutes. The translation here given is from a leaflet which Dr. Laborde distributes among his pupils, and its publication is believed to be timely:

1. As soon as the drowning man has been taken from the water, force open his mouth. If the teeth are clenched, separate them with the fingers, or by means of any hard object—e. g., a piece of wood, the end of a cane, the handle of a knife, or a fork.

2. Firmly seize between the thumb and the first finger of the right hand the end of the tongue, using your handkerchief, or any piece of linen, to prevent

the tongue from slipping; then repeatedly, rhythmically, and with decision, pull it from the mouth, and relax it alternately—at the rate of least twenty times a minute, imitating the cadenced movement of expiration and inspiration.

3. At the same time introduce, far back into the throat, the first finger of the left hand, pressing upon the base of the tongue, so as to induce vomiting, and thus free the stomach of the water or food which encumbers it.

4. This treatment, the most efficacious known method of bringing back the respiration, must be begun without the slightest delay, and persistently continued for a half-hour, an hour, or more. At the same time all the usual remedies must be applied. Most important are the removal of the clothes, friction over the whole body, pressure upon the interior part of the chest, the restoration of the bodily heat, and, where it is possible, the application upon the region of the heart of compresses of very hot water.

The same method may and should be applied, in the same manner, in all cases of asphyxia and of syncope (loss of consciousness), from whatever cause.

The Gold Production of North America, Its Geological Derivation and Probable Future.

NUMBER III.—CONCLUDED.

A fourth and last class of veins which produce gold are those of Tertiary, mostly post-Miocene, age, and which usually are found cutting heavy andesite flows, more rarely rhyolite and basalt, in regions of intense volcanic activity.

These veins in Tertiary lavas have certain characteristics which have caused the belief that they form a fairly well defined class. They are called propylitic veins, alluding to the peculiar alteration of adjoining rocks which seems to characterize them. The ores are nearly always quartzose and sometimes contain silver alone, more rarely gold, but most commonly both gold and silver in about equal quantities by value.

They are often characterized by great richness, the word bonanza being first coined to represent their big ore shoots. Aside from enriching surface processes, the greatest values appear to occur not far from the surface. The gold is nearly always in such peculiarly fine distribution that extensive and rich placers are rarely formed from them, contrasting in this respect against conditions in the Pacific gold belt. Many of them, in districts of great erosion, show that the values continue in depth, but perhaps less rich than those parts formed nearer to the original surface. For in this class we evidently have to do with the part of the vein which was not far from the original surface at the time of ore deposition. In some cases the ores can be proved to have been formed but a few hundred feet from this surface. Instead of roots of veins, as in the Pacific and Appalachian belts, the propylitic veins represent the uppermost part of the area of deposition along the fissure. While some of these veins yield steady and reliable products, many of them burst out in sudden blazes of glory, like stars, only to be equally suddenly extinguished.

This belt of propylitic veins is most extensively developed in Mexico. The central plateau contains the great silver veins of this class which always contain a small amount of gold, and from which the greater part of Mexico's gold output has been derived. But along the western slope of the Sierra Madre in Chihuahua, Zacatecas and Sinaloa the heavy andesite flows contain gold-silver veins of great importance, and, together with the veins of the older belt in Sonora, are largely responsible for the greatly increased gold production of Mexico.

Entering the United States, the propylitic veins are found in Arizona and New Mexico. In Arizona probably both Cretaceous and Tertiary veins occur, but their separation is not always easy in the present state of our knowledge. The Commonwealth mine in Cochise county is a prominent representation of the propylitic class. It breaks through rhyolite and is at present one of the largest producers of the Territory. One-third of the value is gold and the rest silver.

In New Mexico are several districts containing these veins, chiefly, it is said, in andesitic rock, but the output of this Territory has not yet reached the million dollar mark.

The propylitic veins of Arizona continue northward into Nevada and California. San Bernardino county in California contains silver deposits in rhyolite and probably also Tertiary gold veins. Veins of similar kind continue along the eastern foot of the Sierra Nevada as far north as Alpine county and become most productive in Mono county. The mines at Bodie in andesite produced in nine years \$12,000,000 gold, besides much silver.

Going northward from this point, the propylitic veins disappear for long distance, though the volcanic activity along the Pacific has been great during the Tertiary. Only at one place in Oregon, in the Bohemia district in the Cascade mountains, the volcanic rocks contain gold veins, but they have not as yet yielded much. Continuing northward into Washing-

ton, the Monte Cristo veins, in andesite and diorite, represent this type, but are not credited with extraordinary production.

No veins of this class are thus far known from British Columbia or the Northwest Territory, but in the Alaskan southern coast we meet sporadic cases again.

Returning again to Arizona, we trace its propylitic vein northward into Nevada, and here we find this class abundantly represented. The Comstock vein, Tuscarora, Eureka, Tonopah, the DeLamar veins, all are known or believed to be of propylitic character, and, with the exception of the latter, occur in volcanic rocks. The Comstock easily leads with an estimated production of over \$140,000,000 in gold, and the other districts have contributed heavily to the total output, although all contain much silver in their ores. The production of Nevada has fluctuated greatly and after long declines is again increasing.

A line of propylitic veins continues northward from Nevada into Idaho. In the southern part of that State they are represented by the Owyhee gold and silver mines, which, since their discovery, have yielded \$12,000,000 in gold, and farther north by the bonanzas of Rocky Bar, Atlanta and Custer. Still farther north is the Thunder Mountain district, which, if reports are reliable, contain gold in rhyolite. But as far as known they do not extend farther north.

In Utah veins of this class occur, for instance, in the Horn Silver mine, and at Tintic, but these deposits carry very little gold.

Returning now to New Mexico, the propylitic veins continue from that Territory up into Colorado, and here reach a development not known elsewhere except in Mexico. The total output of Colorado is upward of \$230,000,000 and but little of it has resulted from placer mining. In 1900 the output was \$28,900,000. Excepting the Leadville deposits, the principal gold producing districts are of Tertiary age. Oldest among them as to discovery are the veins of Gilpin, Boulder and Clear Creek. These districts have been remarkably steady producers since 1859 and contribute annually about \$3,000,000. They promise to continue in the same way for a long time. The next region is the San Juan district in southwestern Colorado, where strong quartz veins cut heavy andesitic flows. The yield has increased greatly since 1890 and in 1900 reached \$4,000,000. It promises well for the future and some of the mines, like the Camp Bird, have proved veritable bonanzas. The output will probably continue to increase for some years.

Finally there is the great Cripple Creek district, which since 1892 has yielded \$77,300,000, and during 1899 \$18,000,000. The network of veins occur in andesite, phonolite and underlying granite and have thus far chiefly carried telluride ores. A most important question, and one not easy to answer, is what may be expected of this district in the future? While recognizing the difficulty it would perhaps seem admissible to express a belief that the highest mark has nearly been reached.

North of Colorado the propylitic deposits are almost absent, though they appear in sporadic form in Montana.

Roughly calculated, about \$337,000,000 has been contributed by the propylitic veins to the total gold output of the United States, to which should probably be added \$200,000,000 from Mexico. For 1900 we may estimate \$35,000,000 as the output of these veins in the United States and perhaps \$7,000,000 in Mexico. Summing up the data obtained, we should estimate as follows:

	Total.	1900.
Pre-Cambrian.....	\$ 144,000,000	\$ 4,000,000
Cretaceous (Pacific).....	1,400,000,000	50,000,000
Cretaceous (Central).....	310,000,000	18,000,000
Tertiary, propylitic.....	537,000,000	18,000,000
Totals	\$2,391,000,000	\$90,000,000

The output of the pre-Cambrian veins will probably continue steady for many years. Owing to gradual exhaustion of northern placers (if no new important finds are made) the output from the Pacific Cretaceous belt will probably decrease. California may be expected to hold her own for many years and increase is probable in Idaho and Oregon. The central Cretaceous veins may be expected to hold their own, except if for some reason the copper and silver industries should decline.

Most difficult to calculate are the probabilities of the Tertiary propylitic belts. While the violent fluctuations in the Cretaceous Pacific belt are due to placer discoveries, those in the propylitic belt are caused by discoveries of vein bonanzas, and these cannot be foreseen. Another Cripple Creek may well be discovered. The new Tonopah camp of Nevada belongs to this class and may be expected to swell the product of Nevada for 1901. Much is expected of Mexico's future gold product and the rapid increase bids fair to continue for the next few years. Regarding the output from the propylitic veins in the United States a decrease is probable, if no new discoveries are made.

THE eighty-third meeting of the American Institute of Mining Engineers will be held at New Haven, Conn., beginning Tuesday evening, October 14.

Oil Process for Ore Concentration.

Under date of Sept. 29th is received a report from G. A. Ohren, consular agent at Rossland, B. C., wherein he says that a new process for concentrating ores by the use of oil is being introduced there by the Canadian Ore Concentration of London.

The ores of the mines in that vicinity contain gold, copper, silver and lead. Ore from a property on the British Columbia coast, containing 2.2% of copper, showed by water concentration a loss ranging from 30% to 58.6%, mainly arising from float mineral, the surface of the water being covered with a scum of metallic mineral which would not sink. By the oil process the loss was 7%, extraction 93% of the assay value. The process is described as follows:

"The ore having been reduced to a freely flowing pulp (oil and suitably pulverized ore) passes directly from the mill into the open end of a horizontal rotating drum, inside of which is fixed a helix with cross blades or buckets which lift up the pulp to a certain height and drop it again, at the same time propelling it forward to the opposite end of the drum, thus keeping the pulp in constant agitation for the few seconds which are occupied in its passage. With the pulp is also admitted a small quantity of thick, sticky oil, known as summer drak oil. This is of course subjected to the same agitation as the pulp. It picks up and holds the mineral that is floating about or suspended in the pulp in minute particles, and does not appear to have any effect upon the particles of rock with which it comes in contact.

"The oil and pulp automatically discharge from the other end of the drum into a pointed box, or spitzkasten, in which the tailings or rock at once settle down and pass off with the water at the bottom, while the oil floats up to the top and carries with it practically all the values which the ore contained. From the top of the pointed box the oil, with its mineral, flows off into a specially constructed centrifugal machine, where the oil is extracted from the mineral and is at once ready for reuse.

"For close extraction, three mixing cylinders are sometimes used, the pulp passing from one to the other and receiving fresh streams of oil. A second centrifugal machine is also found desirable below the first, to further extract the oil and water from the concentrates. The concentrates are left in the machine practically free from oil.

"The process was first tried in the laboratory, then on a small working scale, and then with a plant erected at Gladsir mine, Wales, capable of treating about fifty tons of ore per week. After a lengthened trial of this plant it was replaced by a much larger one, which treats 250 tons per week. The tests gave a recovery by oil of 90%.

"A plant of four units, capable of treating 100 tons of ore per day of twenty-four hours, costs f. o. b. London, exclusive of power plant and crushing apparatus, \$10,706. The crude petroleum residuum, of which little is lost, costs only a few cents per gallon, according to place of delivery. The cost of working the plant necessarily varies according to the locality and local conditions, but in many cases will be very moderate, comparing favorably with water concentration. It is proposed to grant licenses for the use of the process, and to fix charges at a low rate on the product of the ore treated or on each unit of plant.

"The oil so far found most suitable for the purpose of oil concentration is known in the trade as summer drak oil (Pennsylvania). Its specific gravity is 0.885, its flash point 0.46 to 0.48, its cold test 0.45 to 0.5, and its viscosity at 100° F. in 200 seconds, with a given viscosity, the lower the specific gravity the better.

One unit* costs about.....\$1700
Separators cost..... 2200

"A set of separators is sufficient for four units; a set of four units, to treat 100 tons per day, would cost \$6800, which, with the separators, would make a total of \$9000.

"As an instance of the commercial utility of the process, the results obtained from ore from one of the best known mining properties in Canada—the Le Roi—may be cited. The treatment of the dump ore, containing one-half of 1% of copper, showed that about fifteen tons could at a small cost be concentrated into one ton containing 6% of copper, together with a high recovery of gold and silver.

"A report issued last December gave the cost of smelting Le Roi ore as \$6 per ton—I believe it is about \$4.50 per ton at this date—and as, by the use of this process, only one ton out of fifteen would have to be smelted, the saving is self-evident.

"It is said that plants have been ordered for mines in England, Wales, Sweden and Norway.

"The process appears to be specially applicable to low-grade sulphide ores, especially such as have a tendency to slime when crushed, and for treating tailings from richer ores. Experiments seem also to have demonstrated the feasibility of separating, at a small cost, sulphides, such as copper pyrites, from oxides, such as magnetite, etc.

"For further information parties interested should write to M. T. Wigham, 826 Salisbury House, London Wall, E. C. The process is patented in the United States and Canada."

*One unit deals with twenty-five tons per every twenty-four hours.

The Cripple Creek Reel.

The Cripple Creek reel, illustrated herewith, is a newly patented device for holding engineers' long steel band measures. The short chain or steel tape held horizontally for engineers' and surveyors' field

The Cripple Creek Reel.

measurements has been largely superseded by the long, narrow steel tape, usually 500 feet, the long, accurate measure with the vertical angle and calculation for the horizontal and vertical co-ordinates doing away with plumb bobs, pins and leveling. The method of slope measuring is more accurate, requires less time and less assistance and carries the vertical distances accurately without the use of a level or level rod.

A drawback to the use of the long tape has been the want of a satisfactory reel. The long steel tapes are necessarily light and narrow, a width of even $\frac{1}{4}$ inch being objectionable in the wind, aside from its weight. Most steel measuring tapes of 500 feet or more in length are from $\frac{3}{16}$ to $\frac{1}{8}$ inch in width. With such tapes, or even to a width of $\frac{1}{4}$ inch, it is not always practicable to wind on a reel in a single section, like the ordinary method with pocket tapes, for

The Cummer Patent Mechanical Stoker.

a greater length than 300 feet. Beyond this length a tape must be wound promiscuously on a wide spool. The winding presents no difficulty, but when, as most commonly is the case, only a portion of the tape is required for a measurement, the portion remaining on the reel manifests a tendency to uncoil in a clock spring fashion as soon as the reel is laid upon the ground or the operator's tension is otherwise relaxed. To prevent this uncoiling by the tape's own elasticity numerous devices have been used. Most of these devices consist of either a stop or a brake to prevent the spool from turning, or a framework to prevent the uncoiling steel band from escaping from the spool. But neither of these prevent the steel tape itself from partially uncoiling and tangling, the difficulty occurring when the rewinding operation is begun.

The Cripple Creek reel applies a rolling friction to the tape only. The reel always remains free to wind or unwind with ease; the resistance is applied only to the uncoiling tendency of the steel band. Thus the man in charge of the reel may leave it lying loose upon the ground or hung upon a limb of a tree, while the man at the end of the tape pulls out as much as

may be needed. Then the rewinding is effected without delay or annoyance.

The reel is light, compact, durable and in good shape to be carried by a shoulder strap and used by a transit man without removing from the body.

It was designed and patented by two practical field engineers, J. E. Chapson and V. G. Hills, and is furnished by them at Cripple Creek, Colo.

Refrigeration by Compressed Air.

A writer in the National Engineer, in connection with cooling water by means of compressed air, says the cold, expanded pipe should only be led through a pipe or coil of pipe dipped into the water to be cooled, then exhausted into the atmosphere, and recalls a fact of personal experience when in charge of some tunnel work. A ventilator fan blowing fresh air to the front was actuated by a small steam engine working with compressed air, the exhaust of which was led into a closed chest containing tin tumblers filled with water. On its way to the discharge orifice the current of escaping air was passing along the row of tumblers, and some ten to fifteen pounds of ice were thus daily made quite readily. The miners felt interested in the progress of the refrigeration, and the men of the outgoing shift would seldom fail to dip a dusty finger into some of the tumblers, whose main peculiarity was the existence of a black core at the center of the block of ice.

The air which has done expansive work behind a piston moving in a cylinder escapes at a low temperature and at a moderate speed, and is fit for use as a refrigerating agent. In the air which is simply released through a valve the whole expansive work is converted into velocity and almost instantaneously transformed into heat by friction with the surrounding atmosphere or against the neighboring bodies. The result is that no cold can practically be produced in this manner.

Besides, the use of an expansion cylinder coupled to the compressing cylinder reduces to a minimum the actual amount of work required by this process of refrigeration. Its efficiency is low, and it is not economical on a large scale, as compared with the ammonia process; but it possesses advantages of simplicity, of cheapness and of safety which in many cases will make it quite valuable.

Self-Contained Dryer.

The F. D. Cummer & Son Co., Cleveland, Ohio, manufacturers of the Cummer dryer, have recently put upon the market what is called the Cummer self-contained dryer. The dryer is enclosed in a steel casing, the sides of which are lined with firebrick. The cover is of steel, protected from the heat by fireproofing. The Cummer patent mechanical stoker is shown in the accompanying illustration, but the furnace can be arranged for any type of grates for burning any kind of fuel. The dryer is shipped complete in every particular, and can be erected in a very short time. A feature about the Cummer self-

contained dryer is that no piece or part is extraordinarily heavy, and the dryer can be dismantled and moved from one place to another when occasion demands it. This type of dryer is used for drying coal, stone, marl, clay, slag, ores, concentrates, slimes and many other materials. It is made in a number of sizes, and can be supplied on short notice and at low prices. Mention is made of this dryer in an article on the Silver King mill, Utah, on page 204.

NORTH AMERICA is to be spanned by another railroad. This is to be known as the Trans-Canada line, and is to be north of the Canadian Pacific. It is to run from Quebec, on the St. Lawrence, to Port Simpson, on the Pacific, and will evidently be shorter than either the other Canadian line or than any one of the United States' five transcontinental roads. The plan is to run the road from Quebec almost north to Lake St. John, then a little north of west to James Bay; and from that point the general direction, allowing for occasional short detours made necessary by the conformation of the country, will be westward through the Peace River valley, and over the Pine River pass to Port Simpson.

Mining and Metallurgical Patents.

Patents Issued September 30, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

CUTTER HEAD FOR HYDRAULIC DREDGERS. — No. 709,861; L. W. Bates, Chicago, Ill.

In combination with hollow cutter head, provided with outwardly extending rim or flange; driving shaft extending therethrough and secured to head; conical disk G secured to lower end of shaft; rings I', I attached to cutter head and disk respectively, rings being provided with outwardly extending lugs; and series of cutters attached to lugs.

FUME ARRESTER. — No. 709,896; A. W. Gilliland, St. Louis, Mo.

Fume arrester, comprising chamber divided into compartments by transverse partitions, openings in partitions at alternately opposite ends, cooling passage in each compartment communicating at each end with external atmosphere, cooling tower communicating at upper ends opening below into tank, vertical series of superposed screens in one passage, means for spraying water down each passage.

DREDGER AND EXCAVATOR. — No. 710,054; I. B. Hammond, Portland, Or.

Combination with dredge ladder of tumblers for dredge chain, consisting of two side plates having

projecting ledges on inner faces, providing interrupted, narrow rims on which to receive dredge chain, leaving space between such rims for carriers to pass through; endless dredge chain and buckets; traveling carriers therefor attached below chain, narrowed toward base, so that such carriers in width occupy only portion of space within span of buckets; railed way extending length of upper surface of ladder leading from and to tumblers; railed way extending from upper tumbler along under surface of ladder for part of its length, being disconnected at convenient point allowing enough of dredge chain and buckets at lower end of ladder to hang free, to provide sufficient drag; guard for holding chain carriers traveling along railed way on under side of ladder against lateral thrust or strain.

APPARATUS FOR PRODUCING WHITE LEAD. — No. 709,954; J. W. Bailey, Jersey City, N. J.

Apparatus for making white lead or similar products, combination with corroding chamber, means for supporting and moving carrier, feed chute to feed comminuted lead to carrier, chute being adapted to rock on pivot, means for rocking chute, means for comminuting lead and feeding it into feed chute, bath provided with moistening agent through which carrier moves before passing into corroding chamber so as to wet comminuted lead, means for supplying suitable corroding gas to chamber, one or more traveling carriers for lead in chamber adapted to receive lead from first carrier, means for supporting and moving carriers in chamber.

METHOD OF TREATING MATTES. — No. 710,300; J. A. Potter and W. C. Harvie, Monterey, Mexico.

Method of treating matte, consisting in exposing surface of bath of liquid matte to action of air blast, breaking up crust which forms on surface of bath, bringing fresh portions of bath into position to be acted upon by air, subjecting second bath of molten matte to similar operation, supplying heat from second bath to first bath while latter is in later stage of desulphurization.

ELECTROMETALLURGIC TREATMENT OF ORES OF COPPER OR OTHER METALS. — No. 710,346; C. J. Tossizza, Paris, France.

In electrolytic decomposition of impure solutions obtained by roasting sulphide ores and dissolving products of such roasting, process of recovering metal from solution without preliminary treatment to remove another metal or other metals present therein, consisting in introducing sulphurous acid from roasting operation into electrolytic bath, while at the same time adjusting voltage in such manner as to effect decomposition of salts of metal to be recovered and not of other metals present in solution.

FURNACE FOR SEPARATING ZINC FROM ORES. — No. 710,217; A. M. G. Sehillot, Paris, France.

In furnace for extracting zinc from ores, combustion chamber divided into front and rear compartments adapted to hold ores to be treated, and charcoal, respectively; air-blast pipes communicating with front, compartments connected by openings in their division wall, condensing chambers connected by suitable openings with upper and lower portions of rear compartment of furnace.

Removing Oil From Exhaust Steam.

TO THE EDITOR:—What is the best way to remove oil from condensed exhaust steam? Water is scarce here and we are compelled to save all possible. Is it necessary to use a filter to extract the oil? G. F. L.

Ludwig Mine, Yerington, Nev., Sept. 30.

You could use a filter, but if not convenient a home made device can be made and rigged up on the spot which may answer. It is to be used where the returns come through steam traps. Get three whisky barrels and connect them by 1½ or 1½-inch pipe, as shown in the sketch. The drips from the traps flow

Simple Apparatus for Purifying Oily Feed-water.

into barrel No. 1. The barrels are open at the top, as no pressure is carried in any of them.

When all the barrels fill to the water line indicated the oil and scum will be taken off by the overflow pipe B. If enough water does not come from the drips to keep the barrels filled to the water level, the deficiency is supplied from the cold water pipe C. By opening the valve A, barrel No. 1 can be drained out, and also any oil and scum that has worked through into barrel No. 2 will run out through the pipe connection into No. 1. The cold water feed will then wash out barrel No. 1. Valves may be put in the bottoms of barrels Nos. 2 and 3 to drain them completely, but they are not absolutely necessary.

Gold on Hand and to be Produced.

George E. Roberts, Director of the United States Mint, says that the output of the Transvaal mines this year will probably be about \$35,000,000, and that it may be expected to increase, as laborers can be obtained until it reaches and perhaps even exceeds the rate of production maintained when the war broke out, which was about \$100,000,000 a year. He is of the opinion that the production in North America this year will be larger than ever.

Mr. Roberts says that the total stock of gold in the world in monetary use is estimated as about \$5,000,000,000, but the total amount actually held as bank reserves is only about \$20,000,000,000. He says that a large portion of the new gold must be added to the bank reserves. He adds that although the first effect may be to lower interest rates, it is a well-known fact that low rates of interest tend to advance the value of all dividend-paying properties and stimulate speculation until the surplus reserves are exhausted. He further states that the permanent result is not a lower rate of interest, but higher values for properties.

In his opinion, this country is entering upon a period during which wages and all fixed payments will have a declining value, as compared with properties. He adds that to what this tendency may be modified, as it was in the 1850 to 1860 period, by the new uses for gold and in the rehabilitation of the monetary system and in the industrial development of hitherto backward countries, remains to be seen. With a total production of \$350,000,000 per annum, probably \$250,000,000 would, in his opinion, be available for monetary use, or about one-eighth of the sum now in the world's bank reserves.

THE American Smelting & Refining Co. paid dividend No. 13 of 1½% quarterly on the preferred stock on the 7th inst.—\$875,000; total since incorporation, \$8,891,553 on the preferred stock. No dividend has yet been declared on the common stock, all the earnings being absorbed by the interest guaranteed on the preferred stock. Shares of the latter are selling for \$96 and of the common at \$46.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCHISE COUNTY.

Regarding the Cananea, Yaqui River & Pacific Railroad, Epes Randolph says two corps of surveyors are near Cochise, making the last survey, and work will be commenced at the end of this week. Ties and rails are already on the ground. Surveyors are also in the field north of Cochise, and it is his desire to extend the line north to Clifton as soon as possible. From that point the Durango and Clifton survey would be followed until the road tapped the coal fields of Colorado. He says that when the Cananea, Yaqui River & Pacific Railroad was organized it was with the intention of connecting the coal fields of Colorado with the mining districts of southern Arizona and northern Sonora. This is the ultimate object of the road. The first part of the road will be built from Cochise to Naco and then from Cochise to Clifton. Eventually the line will be extended from Colorado to the coast.

W. F. Staunton at Tombstone has men cleaning out the old workings on the 600-foot level and connecting them with the new shaft. Sinking will be resumed.

The Copper Queen M. Co. at Bisbee employs between 1400 and 1500 men. The mines are operated through five shafts, the Czar, Holbrook, Spray, Gardner and Lowell.

At Benson the Empire smelter will be ready to blow in Jan. 1.

GILA COUNTY.

V. V. Clark is at Pinto building a concentrator for the Pinto Creek M. and S. Co.

At Globe, Superintendent G. S. Andrus of the Globe-Boston G. M. Co. has resumed work. The shaft on the Mallory mine now 200 feet down, will be sunk 250 feet farther.

GRAHAM COUNTY.

At Clifton, the September copper product of the Shannon is reported to have aggregated 450,000 pounds.

MARICOPA COUNTY.

Wickenburg reports ore entered in the 300-foot level of the Oro Grande, proving the continuity with another 100 feet of depth of the ore shoot.

In the San Domingo district the Maricopa G. Co. has three dry concentrators of 4, 6 and 9 H. P., run by gasoline engines.—The White Cloud has started sinking its main shaft.—The Trilby and Exposition claims are being worked.—H. LeRoy is developing the Judge Ainsworth property.—H. E. Armitage has a diamond drill exploring the Hercules property in the San Domingo section east of Morristown.—Cox & Snyder have bought one-third interest in the Gilbert-Scott-Rowe property, 11 miles east of Morristown.

A strike is reported in the Poland-Nelson mine, Greenlee district; a shaft sunk, 100 feet, all in ore; a crosscut run 14 feet without reaching the wall; samples of the crosscut give 8% copper, \$7 to \$14 in gold and 6 ounces silver.

MOHAVE COUNTY.

F. Stull, superintendent Lucky Boy mine, is getting out ore in the 400 level. The crosscut on the 500 level has not yet reached the vein.

On the 300, 400 and 500 levels of the Elkhart mine men are stoping out ore. The Miner says negotiations are under way for the sale of the mine to E. T. Loy.

The Miner says the Leland-Mitchell Co. has laid out a millsite on the Arizona side of the Colorado river, to be used contingently on the failure of the promoters to build the railroad from the main Santa Fe to the mines. The company will build a line of road from the mines to the river if the other line does not go in, and will then erect the mills on the mesa close to the Colorado.

A carload of iron ore from Cerrillos, New Mexico, for flux is at the Chlorides smelter.

PIMA COUNTY.

The Santa Rita M. & W. Co. is incorporated at Tucson. The company is composed of San Francisco men with S. L. Kingan, of Tucson, to work the placer gold fields in the foothills of the Santa Rita mountains. They propose to take water from reservoirs in the Santa Rita mountains and pipe it for 9 miles to the ground.

The Blanco property is sold to Pennsylvania men; consideration named in deed, \$60,000. It is in the Arivaca district, 70 miles south of Tucson, and consists of a group of three claims—the Oro Blanco, Parallel and Extension. It is a low-grade gold proposition; the ore is free-milling. Considerable development work has been

done on the different claims and a body of ore 12 feet in width opened up. The ore is said to average \$20.

PINAL COUNTY.

The Copper Hill M. Co., 4 miles from Oracle, will build a traction engine road to the nearest railroad station, 24 miles, and propose to put in a leaching plant of 100 tons daily capacity.

SANTA CRUZ COUNTY.

At Douglas the Phelps-Dodge Co. is putting in a plant to handle the product of the smelters. A copper wire and sheet copper works will handle the output of the smelters; instead of shipping the converter product to eastern refiners it will be separated and treated there.

Nogales says much interest is manifested in the reported discovery of the lost Tumaneacari mine, on the southwest slope of the Santa Rita mountains. The opening was covered by heavy timbers. The first level was explored 175 feet and shows galena-silver ore.

YAVAPAI COUNTY.

At Butte, Mont., it is reported that while the apparent cause of the indefinite shutdown of Senator Clark's United Verde property at Jerome was the fire in the mine, in reality the entire force of miners had made preparations to strike, but were anticipated by Manager H. J. Allen, who discharged every one of the employees except a few guards.

On Mount Union E. E. Bread has the Vermont group, averaging \$12 in gold and \$18 in silver. Mount Union is the center of Yavapai's water supply.

The Oriental Co. has finished its 20-stamp mill below Poland, Big Bug district. It will handle the product of the Postmaster mine.

On the Planet-Saturn claims in Fools gulch, under the superintendency of W. A. Clark, a test run of 1000 tons of ore is being made to give a thorough and practical test pending its sale to Eastern men. No particular place in this property is furnished the ore and no special assorting of the same is permitted. If the sample run is a favorable one in value, it means the outlay of considerable money. The new company behind the Fools gulch project have bonded the Yarnell, the Herndon & Norris and twenty-five other claims, all the available mining ground between Yarnell and Fools gulch. The same company is also operating in the Bradshaw.

The Blue Bell M. Co., E. A. Haggott, superintendent, has adopted the code of mine bell signals now in operation in California and Colorado.

Recently the United Verde Copper Co. handed to the county treasurer \$28,000 tax money and asked for a receipt. They were tendered a receipt which read "on account." A receipt in full was asked for and refused and the \$28,000 was redeposited in the Bank of Arizona. Under the last assessment the total amount of taxes asked from this company is \$48,000.

In the Cypress mine, on Big Bug, recently sold to G. H. Middleton for \$75,000 one shaft, well timbered, is 260 feet deep; three others are 60 feet. The values are principally gold and copper.

Superintendent Brooks of the Bannie G. M. Co. has a body of ore on the 100-foot level. From a prospect winze, south of the new working shaft 216 feet, at a depth of 40 feet, the ore 5 feet wide carries values of \$30 per ton.

YUMA COUNTY.

(Special Correspondence).—The Valenzuela property has again started up after a shutdown of about three weeks. Mr. Deidesheimer of Denver, the treasurer of the company, is in charge during the absence of Colonel Dick Darling.

The Goodenough group, which C. Eichelberger and J. Rivers have been developing during the last three years, has passed into the hands of a company organized in Los Angeles. These properties give excellent indications of developing into a mine.

The Guadalupe Co. are down 350 feet with their deep shaft. They intend to go at least 500 feet. Considerable ore has been encountered in sinking.

Considerable interest has been aroused in camp over the number of companies being incorporated, none of which are working, and in a number of cases the properties are unknown.

The dry washers here are turning in considerable gold. Nearly all are working in good pay.

Quartzite, Oct. 1.

CALIFORNIA.

ALPINE COUNTY.

The Standard Electric Co. have subscribed \$900 for construction of a wagon road from Markleeville to Blue Lakes, provided Markleeville and Alpine county will contribute a like amount or sufficient to complete it.

AMADOR COUNTY.

The Jackson Ledger reports that the

Amador Phoenix has suspended operations.

Grading for forty stamps at the Kennedy is completed, and excavation for twenty more stamps is being pushed. This will give a total milling capacity of 100 stamps. The new hoist, by hoisting four tons at a load, could supply the 100 stamps crushing from 400 to 500 tons per day from the one hoist.

The Mitchell mine is idle, the company being in debt for wages and supplies to the amount of about \$4000. It is expected, however, that everything will be straightened out and the property started.

The Central Eureka paid a dividend of 2 cents per share in September, aggregating \$8000. The Alma M. Co. levied an assessment of 5 cents per share.

At the Edinburgh mine a strong flow of water necessitates additional pumps.

BUTTE COUNTY.

At Nimshew the Bay Counties Power Co. has several crews at work on the dam. The Emma mine, G. L. Smith, superintendent, is washing good gravel. The Butte Star mine, owned by Wilson & Williams, is also washing good gravel.

The Miller mine at Forbestown is to resume.

The Morris Ravine mine has changed hands, is to be reopened and men be put to work at once. G. W. Kimble of El Dorado will have charge. W. W. Mason has been superintendent for the past six years.

The Gold Bank mine, near Forbestown, which was shut down two months ago, has resumed operations with twenty stamps dropping continuously. H. P. Stow is manager and has thirty men at work.

At Forbestown the Denver mine is taking out ore; the 10-stamp mill is running day and night; thirteen men take out a ton of sulphurets a day, besides the free gold that is obtained. M. E. Smith is superintendent.

CALAVERAS COUNTY.

The Melones mill is dropping sixty stamps and is putting in sixty more. The Angels Record says the Utica mill is now dropping 240 stamps, and that each stamp reduces to pulp six tons of ore per day, which seems large duty for a stamp. The Angels mine is dropping twenty stamps on good ore. The Oriole mine is putting in twenty stamps.

The Magnet asserts that about 700 men are employed in the mines and mills of Angels.

DEL NORTE COUNTY.

There are many deposits of black or magnetic sand in this county, and attempts have been made with varying success to extract the gold. The beach along Crescent bay for several miles is rich in deposits of gold-bearing sand. H. Buergermeister of San Francisco is installing an extensive plant 2 miles from Crescent City. Messrs. Lauff, Rice and several others have a sand mine; they recently sent a sample to the Department of the Interior and received a report as follows: "Its initial weight was fifty six ounces; separated into a magnetic portion weighing thirty ounces and non-magnetic portion weighing twenty-six ounces, the magnetic portion assayed 320 pounds of nickel to the ton and the non-magnetic portion contained only a small amount of platinum; but the assay gave gold values of \$978 26 per ton for such concentrates. I return herewith the gold, and enclose in this 14 cents in currency, which is the value of the nickel at 47 cents per pound."

[Signed]

DAVID T. DAY,
Chief of Division."

EL DORADO COUNTY.

The New Manzanita M. Co. has levied an assessment of 2 cents per share, delinquent Nov. 5.

The Larkin M. Co. has levied an assessment of 2 cents per share, delinquent Nov. 1.

KERN COUNTY.

Sweet & Relley have made twelve placer continuous locations on Kern river, between Bodfish creek and the South Fork of Kern river. The old Keysville placer mines are adjacent, also French gulch, where a French company spent \$50,000 but failed owing to too much water. The Power Co.'s canal will be 30 feet wide on the bottom and has twenty times the fall of an ordinary irrigating canal. It will take all the water in the river for ten months in the year. The company has bought off every one who has any water rights and can take all the water. A dredging company was formed several years ago to mine this portion of the river but did not succeed owing to presence of boulders. Sweet & Relley will mine the river bed and bars adjacent.

The Randsburg Miner says: The Butte Lode M. Co., at the Red Dog mill, got \$5000 from ninety-one tons of ore.

Four hundred and ninety-three cars of ore are dumped into the 100-stamp mill of the Yellow Aster Co.; each car holds from 2000 to 2300 pounds.

MONO COUNTY.

J. L. Wedekind has bought the Golden Gate mining property, near Coleville, and will spend the winter in developing it.

Superintendent Nelson, W. H. Thomas, consulting engineer British Columbia C. Co., and W. Davidson of Salt Lake, Utah, are examining the property of the Goleta Co. at Jordan.

NEVADA COUNTY.

Near west Grass Valley L. Williams, Superintendent Niagara mine, is sinking a double compartment shaft, now down 135 feet.

The new pump for the central shaft of the North Star mines has a direct vertical lift of 1400 feet.

J. A. Bunting has incorporated to work some old properties near Nevada City.

PLACER COUNTY.

A shipment of 500 sacks of copper ore was forwarded recently from the Copper Point mine.

The new 1½-mile flume for the Lucania mine, on the American river above Sportsman's Hall, is completed.

The Colfax Sentinel says that on the 1st inst. the Big Dipper M. Co. closed the working of the Big Dipper gravel mine near Iowa Hill under the company's name. Supt R. A. Watson of the Shady Run quartz mine has the new lower tunnel in 130 feet. The upper tunnel is in 500 feet.

Manager G. T. Crozier of the Haub gravel mine is extending the new main tunnel, now in 130 feet. An upraise will be made to gravel in two weeks.

At Shady Run, T. A. Rodgers is superintendent California M. Co. Drifts and crosscuts are being run to open up a body of gravel. Coarse gold is being taken out, one \$53 nugget being taken out last month. The gold brings over \$19 50 per ounce. The company also own the Independent quartz mine adjoining the gravel mine.

SAN BERNARDINO COUNTY.

The Ludlow mines at a depth of 125 feet have a vein 18 feet in thickness. Three feet is copper glance yielding two ounces silver per ton. The Bagdad mine is a blanket ledge with but a foot or two of soil on top for the first 400 feet, then dips until at 700 feet along the ledge it is 200 feet vertical to the surface. The contract for the grading of the branch railroad from the Santa Fe at Ludlow to the mines has been let to C. H. Hawn.

F. M. Smith has sent twenty prospectors to search Death valley for borax, nitre and other mineral deposits. The men left Borate last week. Smith is locally credited with intention to expend \$200,000 in exploring the valley; there is a strong belief at Daggett that rival interests have got the lead of Smith with a larger party of prospectors. It is the purpose of a portion of the Smith expeditions to find and survey a way for a railroad into Death valley. The borax deposits of Death valley are, according to the belief of Smith, large and valuable and outrank the Mojave desert deposits. It is thought that as soon as they can be properly developed they would be worked by him in preference to his mines at Borate.

SANTA CLARA COUNTY.

The Guadalupe quicksilver mines, near Almaden, are starting up. The old shaft has been reopened again. Cinnabar at a depth of 225 feet is said to assay \$500 to the ton. Oil is used for fuel.

SHASTA COUNTY.

A miners' union has been organized at Keswick.

At the Pioneer Black Oak mine, 5 miles from Delta, the Inca Treasure Co. has twenty men employed and will build a gravity tramway 900 feet long from the mine to the wagon road.

H. C. Woodrow of the Texas mine is shipping two carloads of ore a week. Owing to a scarcity of water at the Garlick electric plant, near Copley, there is a present lack of power.

F. B. Poore is superintending development work at the Sam Houston mine, Old Diggings, adjoining the Texas on the north.

At the Bullychoop mine the new \$35,000 mill is finished. It is connected with the mine by an aerial tramway one-half mile long. It will handle sixty tons of ore every twenty-four hours. Thirty miners are employed.

A stockholders' meeting of the Trinity Copper Co. was held at the office of the Corporation Trust Co., Jersey City, N. J., Oct. 7, to re-elect the present board of directors.

SIERRA COUNTY.

J. Lassat, superintendent Poker Flat G. M. & M. Co., will put in a thirty-ton mill to be run by water power. Fourteen men are constructing a road to the mine.

The New Enterprise M. Co., recently organized, has men at work on one of its properties near Rattlesnake hill, above Downieville.

At Alleghany, the Alleghany Con. M. Co. has a tunnel in 750 feet, to go 250 feet

farther, in hope of opening the Blue Channel.

SISKIYOU COUNTY.

The Con. Cal. Hydraulic M. Co. will develop 500 acres gravel land on French creek, 5 miles from Callahans. J. O. Welch, superintendent, is now operating one plant and preparing to put in eight more. The ditch will be raised to get a fall of 700 feet. It is 10 feet wide at the top, 7 feet at the bottom and $\frac{1}{2}$ feet deep. At the head of the creek are six lakes to be converted into a reservoir, where winter water may be stored that there may be continuous operations.

C. W. Tryer is superintendent of the Tryer group, 4 miles south of Klamath. The lodges trend from the northwest to the southeast and in formation are schist, slate and porphyry, 3 to 23 feet in width, the ore of a rhombohedral quartz with slate intermingled. They give a return mill value of from \$3 to \$50 per ton. There have been three tunnels driven on the property, 600 feet apart, going in 490, 360 and 175 feet; greatest depth from the surface 400 feet at the breast of the lower or 490-foot tunnel. The quartz mill is 1 mile distant from the mine.

SONOMA COUNTY.

Ore from the Culver-Baer quicksilver mine, at Cloverdale, is reported to carry cinnabar in sufficient quantities to justify operation.

TUOLUMNE COUNTY.

(Special Correspondence).—The Star mine on the East Belt has completed renovation of its flume, and will resume operations with the first rains.

The Republican mine at Jacksonville has completed its dam on Woods creek. The water will be raised to the level of the ditch at a point nearer the mill, and loss by evaporation thus lessened. The mill is approaching completion. Sinking continues in the mine, the 500-foot level having been passed. Work will be concentrated in the shaft till the mill resumes operations.

At the Eagle-Shawmut property a protecting ditch is building to catch the surface water, which in the past has found its way into the workings.

Owing to the scarcity of teamsters, the Columbia marble quarry has bought a traction engine to do the work hitherto done by horses.

Sonora, Oct. 6.

The Lady Washington is to be surveyed preparatory to putting in a compressor.

F. H. Harvey has bonded two-thirds of the Garfield mill and will run his ore through the Grizzly mill.—Superintendent Smith has men at work on the Mary Ellen mine.—The New Era hears that the money to reopen the Laura mine has been deposited in Stockton and that operations will begin Nov. 1.—At the Goldwin work has ceased on the 600-foot level. A new pump will be installed and the hoist enlarged.

Superintendent K. C. Parrish of the Spring Gulch has the mine unwatered and sinking and drifting commenced.—The Hardack is all ready to start and is awaiting fuel oil.—Work on the Lost Fox mine is to be resumed. The mill will start Nov. 1.

The Hazel Dell management intends to run a tunnel from the river level 4000 feet to drain the mine and give 900 feet of backs.

At Stent the new millmen at the Juniper mine are F. Drobis and R. L. Aldersley of Grass Valley.

Near Columbia the Vine Spring mine has been bonded to the Yankee Hill M. Co.

The directors of the Von Tromp M. Co., recently incorporated, are W. S. Estey, D. F. Davids, W. O. Chapman, H. Walsh of New York, R. B. Stanford of Columbia.

Near Big Oak Flat Watts & Jefferson have options on the Bicknell, Mohrman, Redjacket, McCarthea and Fair claims.

Near Jupiter the Star M. Co. has completed the flume.—The Stockton Gravel M. Co. have their mill in running order.—The Keltz mine is working steadily. The 10-stamp mill is in constant operation.

The Columbia marble quarry, W. D. Bannister manager, will freight the marble from the quarry to Oakdale with a traction engine and three cars. The traction engine is of 60 H. P., 17 feet 3 inches in height, 11 feet 4 inches wide, 10 feet track, and weighs twenty-three tons. The drivers are 8 feet high and have a face of 24 inches.

Near Stent, at the Shawmut seventy-five men are employed digging a ditch on Blue gulch to take all the water out of the gulch above the mine to prevent flooding of the mine in case of the dam at the head of the pipe line breaking.

TRINITY COUNTY.

B. Glatz, superintendent of construction for the Francis Smith Co. of San Francisco, who had charge of constructing the large pipe line for the Sweepstake Co., now has men at the old pipe shop taking down runways, packing up tools, etc.,

preparatory to shipping them to San Francisco. There will be nearly forty tons of machinery.

COLORADO.

ARAPAHOE COUNTY.

With only one smelter depositing gold bullion at the Denver branch mint, the Boston-Colorado plant in Argo, the total for September foots up \$1,283,626.94, compared with \$1,134,745.92 in September, 1901. The gain, \$148,881.04, is due mainly to the chemical plants, of which the United States Reduction, the Portland, the Telluride and the Economic, all mining on Cripple Creek ores, are regular depositors. Amalgamation mills in the mining districts and placers in Boulder, Gilpin, Clear Creek, Park, Lake and Summit counties also deposit at the mint. The season of 1902, taken as a rule, has shown a gain over last year. The new coinage mint will be completed in about three years.

BOULDER COUNTY.

There is not an idle mine in Sunset district. The amalgamating and concentrating mill at Caribou is completed. The Corona G. M. Co. of Maine has bought Black Cloud, St. Joe and fifteen other claims comprising the Gold Hill group. The Colorado Springs Co. having connected the mine with the Bordeaux tunnel has twenty men timbering preparatory to taking the ore through the 2000-foot tunnel to its mill on Left Hand creek. The Nancy tunnel is in 1240 feet.

C. F. Lake is manager at Cardinal of the Boulder County mine where a great tunnel is opening up rich ore bodies. The mine has been running steadily since June, 1901, and is employing twenty men. The mill has been running since April, 1902, treating about 600 tons a month with satisfactory results. The company will enlarge the mill in the spring.

At Wall street the Nancy tunnel is in 1240 feet, 1230 from the mouth the Gillard vein was encountered and drifted in 550 feet east, in this drift a vertical depth of 530 feet is attained and a depth of 600 feet on the vein. Four hundred and fifty feet from the mouth of the tunnel is the Grey copper vein, drifted in 200 feet west and 225 feet east. In the west drift of the Grey copper there is an ore body 7 feet wide and opened the entire length of the drift.

At Caribou the Alpha tunnel to develop the Sunnyside is in 650 feet.

At Salina the Black Swan mill is in operation and the company has contracted for 30 000 tons of ore for treatment.—The Sunshine Co. are stoping milling ore from a 9-foot vein, to be treated at the Black Swan mill.—The Corona is treating twenty-five tons of milling ore at the Black Swan mill. If satisfactory, a 100-ton mill will be erected on Corona ground.

At Gold Hill the Cold Spring Co. is employing thirty men. Connection has been made with the Bordeaux tunnel. The company's mill on Left Hand creek is running full shift.

CLEAR CREEK COUNTY.

J. C. Saunders, who is described as being "a mine expert from Pittsburgh," is announced at Idaho Springs as having "made many interesting experiments," and "out of every two gallons of water I secured a pint of copper." He finds that "the water is loaded with copper." So is Mr. Saunders' story.

The Carpenters, owners of the Golden smelter, have a bond and lease on the Lawrence Stevens group of mines in the Banner district, two miles from Idaho Springs; the amount represented in the transaction is reported to be \$2,000,000.

Idaho Springs hears that the Seaton M. & M. Co. is operating on Seaton mountain, and will construct a mill of large capacity. The Seaton owns 2800 feet on the vein of the same name.

The Georgetown Courier reports two new strikes in the territory of the Empire Tunnel Co. In the main tunnel an ore vein 1 foot in width, samples showing .48 ounce gold and 14 ounces silver. Since passing the 1300-foot mark a daily average of over 5 feet has been made with two drills. The tunnel is now 1375 feet long. A second strike was made in the drift in the sixth level of the Gold Dirt, which is being run to open the ground east of the shaft and get under the big ore bodies opened on the upper levels—2 feet of smelting ore with a body of milling ore on the side. This ore will run two ounces in gold.

The East Argentine Co. is making progress in the D. and Sidney tunnels. Ores from three places on the company territory recently assayed gave \$14 gold, \$11.65 silver and 6% copper; \$32 gold, \$11.20 silver and 3% copper; and 42% lead, \$8 silver and a trace of gold. The company is prepared for continuous winter work.

Idaho Springs says every section of Clear Creek county shows greater development under way during the month of

September than for the same period one year ago. More air drills are at work and operations are more extensive. With all of this there has been no effort at production and the amount of ore in sight is more than double that of the same period last year. The Chamberlain sampler there, which buys most of the smelting product, handled 2040 tons of first-class ore, averaging \$60 a ton. In addition there were shipments of 350 tons direct to the smelters. In milling ore, all of the mills have been running steadily on the offerings with chances of a heavier tonnage with proper facilities.

H. A. Riedel says the Stanley Con. M. & M. Co. will spend \$50,000 in building a new 100-ton mill.

The Dividend M. Co. of Lincoln, Neb., is finishing a 15-stamp mill on Upper Fall river. An option on the Golden Lily mill of twenty stamps is reported secured by the Robinson Contact C. M. Co. This company is credited with intention to put in new tables and a chlorination plant. R. J. Evans is superintendent.

The Centennial, in Georgetown, is breaking down bonnite ore for another shipment. The ore bodies in the 600-foot level continue to show large values in gold and copper. The mine is steadily improving with development in the deepest workings.

The mills of the district are running to their utmost capacity and have reserves of ore on hand.

At Silver Plume work is being pushed on the Terrible mine. Thirty men are at work on the dam.

The Union tunnel has been retimbered from its mouth to the engine room. The entire mine will be pumped out and the necessary improvements made.

Sixty men are employed by the New Dunderberg Co. The camp has more men working by the day than for fourteen years past.

The main drift on the Seven-Thirty lode, through the Bureleigh tunnel, is making progress by machine drills. Total distance of drift to get under the Seven-Thirty shaft and Bismarck workings will exceed 1300 feet; one-half the distance has been driven up to the present time. When completed it will be necessary to upraise 230 feet, where connections will be made. The completion will unwater 5 miles of old workings and also open up a large area of new and undeveloped territory.

The Mendota shaft is at a depth of 400 feet. Ore bodies have existed between the 300 and 400-foot levels, and drifting under these will proceed.

Twenty men are employed on the Vulcan group, connection having been made between the Daniel Peters tunnel and the main shaft. The Wisconsin continues to be the greatest silver producer in the county.

EL PASO COUNTY.

At Colorado Springs, a Colorado steel casting company has been organized to build a steel plant; \$200 000 will be expended in the project. The plant will be equipped with electric traveling cranes, open-mouthed revolving furnaces and facilities for handling heavy steel beams. The building will be constructed of brick and steel and will cover two acres of ground. It is proposed to begin operation with 100 skilled mechanics, who will be brought here from the East.

FREMONT COUNTY.

At Florence forty negroes from Mason, Mo., have arrived and were at once hustled to the Chandler mine and put to work. The men are said to be inexperienced. The negroes imported from southern Colorado and New Mexico some months ago by the company are deserting daily, claiming they cannot make enough to live on, and that after they pay the extortionate charges for life's necessities at the company's store, where they are compelled to trade, they come out at the end of the month in debt.

GILPIN COUNTY.

During the last week of September shipments of smelting and crude ore, mill tailings and concentrates from the Black Hawk depot to the Golden and Denver smelters and to outside points were eighty-one cars—1620 tons—a total for the month of 361 cars, or 7220 tons.

Snows and rains have delayed the installation of the two hoisting plants at the Pewable and Iron shafts.

Superintendent Woods of the Lyons-Kyle M. Co. will put a fifty-ton lead concentrating plant on the property of the company in Chase gulch, in Quartz Valley mining district, to cost \$15,000.

Black Hawk reports that 81 cars—1620 tons—of ore were shipped during the last week in September over the Southern road, making the total for the month 361 cars, or 7220 tons. Comparing last month's shipments with the same month in 1901, it shows a difference of 61 cars—1503 tons—an increase of more than 25%.

The milling ores from the Ohio prop-

erty, in Vermillion district, treated last week at the Gilpin mill produced almost ten ounces gold per cord. The smelting ore shipped to the Chamberlain sampling works gave \$245.10 per ton for first-class and \$119.38 per ton for second-class. The property is owned and operated by Waldhardt & Kurrl.

GRAND COUNTY.

A copper strike is reported on Strawberry creek in the Harman district, 2½ miles southwest of Arapahoe peak.

HINSDALE COUNTY.

W. C. Wisberg, 503 Olive street, St. Louis, Mo., manager Bon Homme M. & D. Co., White Cross, will build a mill next season.

LAKE COUNTY.

General Manager Schlessenger expects to be able to start the Boston smelter near Leadville in a few months.

OURAY COUNTY.

In the Red Mountain section the Saratoga Pyritic Smelter Co. says it will put in a large smelting plant in the old Saratoga mill at Ironton. The company has secured the old Saratoga mill and mining properties adjoining. Men are retimbering the Saratoga and Albany tunnels, from which they will extract smelting ores. The whole country abounds in low grade smelting ores.

The August returns from Camp Bird show that the mill ran thirty days and crushed 5755 tons dry ore, yielding bullion \$129,200; concentrates (355 tons), \$29,725; total, \$158,925; less expenses, \$54,500; profit for month, \$104,425.

PITKIN COUNTY.

The officers of the Argentum-Juniata M. Co. to-day issue their annual report for the year ending June 30th. In the report President J. A. Hayes says: "As the mine is now closed down, from this time on we will discontinue sending quarterly reports to the stockholders. In submitting this report, I find nothing of encouragement and little of interest to add. The present cessation of pumping in the Mollie Gibson mine and the abandonment of at least the active operations for the company's account have necessitated our drawing the pumps from the lower levels. As these levels will soon be flooded with water, this was done to protect our property, and will only leave the workings above the seventh level uncovered. From the estimates made by our general manager, the concentrating plant and other machinery owned by our company would be worth something like \$100,000 even at forced sale."

During the year ending June 30th the company's mining expenses were \$164,447 97; the mill operating, \$26,045.10; the cost of shipping and selling, \$80,761 56; general expenses, such as salaries, office, etc., \$15,157 61; grand total, \$295,427.63. The mine shipped 10,113.9 tons of ore during the year, the gross value of which was \$323,684.98, leaving a net profit at the mine over operating expenses of \$28,257.15.

General Manager Palmer says in his report: "At 3 A. M. of June 30th steam was shut off the seventh and fourth level pumps and the water was allowed to rise and flow down the siphon in the tenth level raise No. 4, whence it reached the Mollie Gibson thirteenth level pumping station at 10 A. M. of the same date. Inventories were taken of the company's property at the mine and at the thirteenth level station of the Mollie Gibson mine, of date June 1, 1901, showing about \$68,000 in value, exclusive of the joint mill. The superintendent of the company was relieved of his duties as superintendent and appointed resident agent of the company on June 30th."

RIO GRANDE COUNTY.

The Sanger mill at Jasper is started up.

SAN JUAN COUNTY.

Near Silverton, the "Letter G" lode of the Silver Lake group is bought by the Guggenheim Exploration Co. The amount paid for the sixteen claims is about \$500,000. The claims are near Silverton, extending 5 miles along the vein beginning at the Silverton townsite. They are 1500 feet each, and extend for 5 miles along a rich vein. The work of putting the property in shape will be in charge of Superintendent S. I. Hallett. It is estimated that it will take about \$300,000 to complete the improvements and will require about three years. It is planned to construct a tramway for the conveying of the ore to Silverton, which will greatly cheapen the cost of transportation. At present it would cost about \$5 per ton to get the ore to market. With the tramway the cost will be reduced to about 10 cents per ton. With the management now under control of one owner, it will be possible to develop the property as much as it is capable. It is estimated that the total tonnage capacity after the property has been put into good working condition will be from 500 to 1000 tons a day. This

will be then one of the largest producing properties in the State. The claims are all rich in gold, silver, copper and lead, and assays show that the ore runs from \$15 to \$20 per ton.

A 40 H. P. boiler for the Notaway Co. is at the Champion mine. Shipments of ore from Silverton exceed twenty carloads daily. The Esmeralda, in Minnie gulch, is shipping forty tons crude ore per week. The gold and silver product runs \$60. A 10% copper ore is being mined from a 30-inch streak in the Henrietta mine. A contract is let this week for 200 feet of tunnel work on the Sapphire mines in Eureka gulch. Manager Estey has 1000 feet of work completed on the properties. The Eureka Exploration Co., owner Ridgway in Minnie gulch, has begun a tunnel to be 3200 feet long and to cut the Ridgway vein 1000 feet below its present deepest workings. Work on the tunnel will be pushed during the winter by hand, next season power drills will be put in.

The upper Sunnyside mill, near Silverton, is running on ore from the Washington mine. The new 40-stamp mill at this mine is completed and started up and will be kept running all winter.

SAN MIGUEL COUNTY.

The T. E. Thomas property, above the Nellie mine, in Bear Creek basin, south of Telluride, consisting of the Thomas No. 1, Thomas No. 2, Buckley, Portom, Button, Echo, Echo millsite, Duke millsite, together with mill, tramway and other improvements and all water rights, is sold to Alva and F. Adams for \$2000.

Work on the Savage basin road, which is being built from Telluride to the Tomboy mine in Savage basin, is suspended, as the funds voted by the people are exhausted.

C. W. Waterman has been examining the title to the Japan group of mines, located near the Tomboy, in Savage basin. Negotiations have been pending for months past for the sale of this property to Boston men for \$550,000. It is understood that the sale will be consummated and the group transferred at an early date. The mine has been operated for nearly a year under bond and lease.

Twenty stamps in the Silver Bell mine at Ophir are in operation on ore from the Butler Con. M. Co.

The lessees of the upper workings of the Butterfly-Terrible mine at Ophir are employing fifteen men. Fifteen stamps in the mill are at work on Terrible ore. The mill crosscut tunnel is in 1950 feet.

At the Nellie twenty stamps are dropping on ore.

C. Toland has a three years' lease on No. 3 level, Silver Pick mine, all the workings above that level, with the stamp and concentrating mill, and the tram connecting the third level with the mill. All workings below No. 3 the company reserves.

SUMMIT COUNTY.

Georgetown hears that the Pennsylvania group, at the head of Snake river, is sold to M. H. Kern of Bellevue, O., for \$75,000.

TELLER COUNTY.

September production from Golden Cycle amounted to 3800 tons.

Cripple Creek mining men do not seriously regard the suit threatened by the Venture corporation against the Stratton estate. The September production from the mine was, approximately, 8000 tons ore.

The Vindicator output for September amounted to 2000 tons ore.

Victor says the sale of the Hoosier mine, on Tenderfoot hill, to Walsh and associates of Chicago, Ill., has been practically completed; price, \$225,000.

The Victor Record says that before Jan. 1 at least 1000 men will be employed on the Portland mine. The mine has been installing much new machinery of a heavy character of late, opening new ground and preparing for increase in the volume of its output. New and powerful machinery has been ordered for shaft No. 1; the machinery at present in use in this shaft will be taken to shaft No. 3, which they are at present sinking to 1000 feet. Shaft No. 2, where it is believed they will conduct their main workings, is to be sunk to the 2000-foot level and an extensive system of exploration will be pushed. A tunnel is being driven from shaft No. 1 through the Colorado City claim recently acquired by the company; it will be about 1800 feet in length.

Cripple Creek reports a strike made by Lessee Erbel of the C. O. D. mine, located in Poverty gulch, in the sixth level, 150 feet from the shaft, a flat vein of ore 6 feet wide running \$50 to the ton.

Chairman F. W. Baker of the Venture Corporation board is in Colorado. When asked about the \$5,000,000 suit against the Stratton estate he said: "The suit will be regularly brought before the United States Court soon. We were sorry that Stratton died, because there were insinuations made that we were flocking

like a band of vultures to despoil the dead man's estate, and it has put us in a very unjust light, as we have been working for eighteen months on the evidence to be brought up in the case. The fact that he died, while unfortunate to us, will not deter us from beginning proceedings. There are many reasons why we will bring our suit, and we want nothing but our own."

F. S. Oakes of the Buffalo & Cripple Creek G. M. Co. has proposed to the committee on drainage of the Cripple Creek camp to extend the tunnel owned by his company (the Newell tunnel) in a northerly direction under Beacon hill for the drainage of the western part of the camp especially. This tunnel has its portal in Arequa gulch, about 100 feet lower than the portal of the Standard tunnel, hence would, if extended, drain the Elkton shaft to the eighth level. This would allow the extraction of a large body of ore between the seventh and eighth levels. The Newell tunnel is the lowest one in the camp. It penetrates Grouse mountain in an easterly direction. The total length of the tunnel and drift is 1900 feet. The Buffalo & Cripple Creek G. M. Co. offers to continue this drift until the great water saturated area is penetrated in Beacon hill, so as to afford about 100 feet deeper drainage than the Standard tunnel. The offer is made on a basis of "No cure, no pay," but in case drainage is effected thereby, so as to drain at least the western part of the camp, and as soon as it is so demonstrated by the lowering of water in the various shafts, the several mines benefited thereby are asked to pay the B. & C. G. M. Co. the sum of \$5000 per month as long as the mines choose to use this method of drainage, it being understood that it may be discontinued at any time by the mine owners giving thirty days notice to the B. & C. G. M. Co. of such desired discontinuance. Mr. Oakes says that since the "drowning" of the Elkton mine many Eastern investors refuse to make further investment in Cripple Creek camp, unless some quick system of drainage is provided. The plan for temporary drainage was presented to the committee on drainage.

There are 538 men at work on Gold hill. They receive on an average \$3.28 per day.

During September Lessee Wright made a production of about 300 tons of ore from the Thompson of the Elkhorn Con. Co. on Gibbons hill; a new ore body has been opened by the lessee and he expects to ship 1000 tons during October.

The Par Value M. & Leasing Co., operating near Victor, has returns on two cars sent out from the recent strike in the 425-foot level on the Mary Cashen mine, the first one going \$25 a ton and the second \$20 a ton. The ore is coming from the slope above the breast of the workings in the south end of the shoot. The vein runs from 5 to 8 feet wide.

The latest Cripple Creek merger is the Wabash Con. G. M. Co., a consolidation of the Summit, Sunnyside and Zanesville companies.

While the litigation in connection with the Stratton will is in progress the mining properties of the late millionaire are being operated exactly as they were during his lifetime. No one yet has the authority to dictate any policy to the officers of the companies in which Mr. Stratton's Cripple Creek investments were vested. The properties are being managed in line with Mr. Stratton's own policy and will be so managed for the present. All the men are now at work and there will be no change in this respect. W. H. Rice, who was general manager of the Stratton properties and who resigned two months ago, has been reappointed to that position by the executors of the Stratton estate. F. Johnson, who was appointed in Mr. Rice's place as manager, will take the superintendency under Mr. Rice.

The new chlorination mill of the Portland in September handled 7000 tons of ore, average \$30 per ton.

The Isabella in September produced 700 tons ore, mostly the work of lessees. There are eleven sets of them at the various workings.

Twenty-two companies own the acreage of Beacon hill; 12 are in active operation. There are employed on the hill, both on company account and by lessees, operating, 264 men, who receive on an average \$3.26 a day.

The El Paso Company's new equipment is costing \$100,000. The company has 120 men who average \$3.50 per day. Twenty men work on the various leases of the property, making a total of 150 men.

The Elkton Con. M. Co. has cancelled the order for two pumps for the 900-foot level because of delay in delivery.

J. H. Hobbs, of the Findley G. M. Co., says his company will sink its shaft an additional 200 feet to a total depth of 1400 feet. A station has been cut at the 1200-foot point. The company is now in good ore in the eleventh level. When the shaft reaches the 1400-foot point a level will be

cut and a crosscut run out to open up the veins.

September's gold yield in Cripple Creek approximated \$2,000,000.

At Cripple Creek, on Mineral hill, R. A. Trevanthen will manage the Laura Lee and will deepen the shaft to the 300-foot point. There is sufficient ore in sight to pay the cost of sinking the shaft and leave a profit.

The final cleanup at the old Oneida mill, south of Victor, is being pushed. It is expected that 500 tons of tailings will be recovered that will average \$22 to the ton. The work is being done by the S. H. Supply Co., which has purchased the old mill and wrecked it for the machinery. The company has purchased all the old mills of the district and in some cases they have recovered enough values in tailings to more than pay the price they paid for the entire outfit.

At the Zenobia mine on Gold hill the control is held by the Stratton estate—a perpetual injunction granted by the court restraining its absorption by the Stratton Cripple Creek M. & D. Co.

IDAHO.

BLAINE COUNTY.

On the Little Smoky river the Poor Man's Friend, bonded to C. C. Ruthrauff of New York City, shows values in native silver, free gold and iron sulphides. Cornwall & Madden, who own claims on the same ledge, have bonded their property to Pittsburgh men. The Shamrock III, discovered by Mr. Worswick, assays \$24 gold. The White Elephant and Green Timber claims are extensions of the Shamrock III, owned by Reed & Murray. C. C. Ruthrauff has bought a half interest in the Shamrock III and Wilbur claims from Mr. Worswick. They have men running a 300-foot tunnel.

F. E. Ickes, Hailey, is secretary Bell Creek Con. M. Co., which has seven claims that cover 2 miles of ground in the Rosetta mining district. The ore is partly free, principally sulphide. It is the intention to drive a tunnel in the property from the Big Smoky 100 feet that will cut the vein at a depth of 200 feet, and to then put in a first-class air compressor plant, with air drills.

The Hailey Times says there is \$200,000 worth of argentiferous galena ore in the dump of the Tyrannus mines, in the Little Smoky mining district. The ore is to stay on the dump until next spring, when the mill is to be started up and kept running steadily thereafter. It was not started up this year because the water supply was likely to run short.

J. Kirschner will resume work on the Wolfstone group, on Deer creek, and the M. & M. and Hidden Treasure extensions of the Tiptop group of mines, Hailey.

BOISE COUNTY.

Near Idaho City, the Acquisition group of quartz claims in El Dorado gulch is sold to V. Thorne for \$15,000. The group includes six claims.

CUSTER COUNTY.

The Lost Packer group of gold-bearing claims on Loon creek has been bought by J. A. Cizek, J. Barnett, C. A. Molson and T. S. Macbeth. In addition to the Lost Packer group the purchasers also acquire considerable adjoining property, all of which will be actively developed.

The White Knob C. Co. at Mackey has laid off its 150 employees pending completion of tunnel to drain the mine, affording economical outlet for the ore, with which connection may be made within eight months, about 1000 feet beyond the present station. Ten men with machine drills are at work thereon. G. Hamilton is superintendent. The ore bodies are large, running in copper, gold and silver.

Three miles from Marble City is the Dewey mine, the discovery of which caused so much attention to be directed to the Thunder mountain district. A recent returned prospector says: "The work at the mine is done in great secrecy. No one is admitted to the mill, and when we went in we were practically ordered to get out. However, it was not before I saw that they have only five stamps in operation. It is said that the company has 100 more stamps at Boise City, but they will not be brought to the present mill of the Dewey mine. It is probable that they will be put up, if they ever are, at Roosevelt, a small place three miles from the mine, and opposite to where Marble City is located. The ore is hauled from the mine to the mill in covered wagons so that no one may see the kind of ore being treated. There is much stuff on the dump and very little is going through the stamps. The company is thinking of putting in concentrators in addition to their stamps."

SHOSHONE COUNTY.

The Empire State-Idaho M. Co., Burke, Idaho, has started the construction of a machine and blacksmith shop near the Hecla shaft house. The framework is partly erected and the building will be

completed in a week or two. The company is also arranging to erect larger and more extensive ore bins. The old bins are no longer sufficient to hold the ore with the increased output. The lumber for the building is on the ground and construction will start in a few days. The company is shipping from four to six cars of ore per day to the mill.

The New Jersey G. M. Co. has bought the Coleman gold property, on Big creek, 6 miles from Wardner.

Delta reports a fourth dredge company to operate the placer grounds of Beaver creek—the Mascot G. M. Co. Construction of three dredgers for the other companies has been started.

The Bunker Hill & Sullivan M. & C. Co. paid a dividend of \$9000 on the 6th inst.

In the litigation of the Yolande M. Co. vs. the Gold Hunter M. Co. et al., previously referred to, the court has denied the motion to remand, and held that no injunction was now in force. It is ordered that the Gold Hunter M. Co. make a full report of the condition of the property in controversy, showing the ore extracted and the expense thereof from date of contract.

J. A. Finch, referring to the agreement recently entered into by Cœur d'Alene mine owners and smelting trust, says: "The agreement assures the mines of this district running to their full capacity in future—12,000 tons per month exclusive of the output of the Bunker Hill, amounting to about 3000 tons a month. The agreement made assures that all mines of the district will be run to their full capacity limit, for 15,000 tons per month, mostly concentrates, will be all that the mills can turn out—more than the monthly average of clean ore and concentrate shipments of 1900, which reached 14,280 per month or 171,412 tons for that year as against a slightly restricted output of 148,890 tons for 1901, or a monthly average of 12,407 tons for the latter year. The aggregate output for 1900 and 1901 was 320,302 tons as against 212,649 tons for the years 1898-99, showing an increase of 107,653 tons, or an average annual increase in excess of 50,000 tons. A production of 15,000 tons per month will be considerably greater than the average for the six months of 1901—from January 1 to July—which was 14,298 a month. It is assumed that if the district is to meet the 15,000 tons per month limit the Frisco mine and mill will have to resume operations, for the combined output of the Silver King and Hercules, the new producing mines, cannot equal the Frisco's old-time product of 2000 tons per month.

The Northwestern sampling and millage plant, a mile west of Wallace, has been sold by the mine owners' association to the American S. & R. Co.

MICHIGAN.

HOUGHTON COUNTY.

At Houghton, in boring up to pierce the roof of the intake tunnel of the Champion mill, the discovery was made of an extensive false bottom under Lake Superior, composed of a saturated stratum of gravel 7 feet thick underlying a thin stratum of hardpan forming the lake bottom. This leaves 12 feet of solid rock over the end of the tunnel, instead of 18 feet, and may explain the trouble with other tunnels from infiltration of sand.

The new cupola smelters at the Dollar Bay plant are a great success, handling 200 tons of slag from the reverberatory furnaces in twenty-four hours. At present it is necessary to run the plant only twelve days each month, as compared with twenty-five days under the old system.

The new plant for the recovery of copper from Calumet & Hecla sands is completed. The plant will have a capacity of 120 tons daily. The process, it is claimed, will save flour copper—something heretofore impracticable.

MONTANA.

DEER LODGE COUNTY.

The Standard says: All of the large hill mines of the Anaconda Co. are to be drained of their water through the shaft of the High Ore, which has reached a depth of nearly 2300 feet. These mines include the Anaconda, St. Lawrence, Never Sweat, High Ore, Green Mountain, Diamond, Bell, Modoc and Wake-Up-Jim. The High Ore has three large pumps on the 1000, two on the 1600 and two at the 2200. It has an 80 or 90-foot sump for the reception of the water from the other properties, and as soon as all of the connections are made, which will be in a short time, all pumping will be suspended at all of the mines save the High Ore. In order to make the drainage perfect the bottom of the latter shaft will be kept below that of the others. The High Ore has very little water of its own, but there is some running into the workings from adjacent mines. At present a crosscut is being driven from the 2200 of the High Ore to connect with the lower workings of the

St. Lawrence, Anaconda and Never Sweat. As soon as it is complete the water of these three mines will flow into the sump of the High Ore and thence forced to the 300 by the large pumps in use there. On the east side of the hill, at a point near the Leonard mine, a tunnel has been driven into the hill and connected with the shaft of the High Ore at a depth of 300 feet from the surface. This is what is known as a water tunnel, it having been designed for the purpose of carrying away the volume from the pumps of the mine. Before the tunnel was driven all of the water was raised to the surface. As a result of the change the copper precipitating plant, which was formerly located near the High Ore, is farther down the hill and is in charge of P. H. Regan. After the connection with the St. Lawrence and other large mines is made the water now flowing into the copper precipitating plant below the St. Lawrence will cease and the plant will be abandoned.

The mines at Danielsville have resumed. Travel between Danielsville and Anaconda is large.

A. Hinze of the Gladstone G. M. Co. is building a mill for his company near Pioneer.

FERGUS COUNTY.

C. A. Carse, at Lewistown, has formed a mining company to explore and work properties in the Judith and Moccasin mountains. He will let a contract for five exploration tunnels from 200 to 300 feet in length.

The Great Northern M. Co. has turned over its Gilt Edge mine to a syndicate headed by J. A. Drake. The mine has paid large dividends. Two installments on the payment of \$50,000 each have been made in the last three months. The amount of the final payment is locally set at half a million dollars. J. A. Drake will make many improvements, both in the general plant and in the mill, the capacity of which will be doubled. Ore from the property runs from \$6 to \$12 a ton and has been worked in the past in a mill with a capacity of 140 tons a day. This will be increased to 300 tons a day. Several fractional claims adjoining the Gilt Edge have been bought by the new company under the name of the Gold Reef M. Co. Roasters will be installed to treat the refractory ore, a 10-drill compressor put in and other apparatus added. J. H. McCormick will be superintendent. Mr. Mackenzie, general manager and consulting engineer of the company, is a member of the firm of Dickman, Mackenzie & Potter, Chicago.

FLATHEAD COUNTY.

F. Cummings of the Friday group at Sylvanite has 18 inches of ore showing free gold.

GALLATIN COUNTY.

F. W. C. Whyte, in charge of the new coal mines, says seventy men are employed by the company at the plant at Storrs; about 100 ovens will be in operation by January 1. It has not been decided whether to go into the manufacture of coke with the idea of saving the by-products or not.

GRANITE COUNTY.

It is expected that the mill of the Denver and Montana Reduction Co. at Garnet will be restarted again next month.

Murray & Miller have leased the Lead King mine at Garnet from P. Mussigbrod. They have shipped a carload of ore which they thought would average between \$60 and \$70 in gold per ton, but it went \$154. The mine is developed to a depth of 500 feet.

LEWIS AND CLARKE COUNTY.

The output for August of the Montana M. Co. was 1600 ounces gold and 10,800 ounces silver, obtained from 2050 tons of ore crushed and 13,468 tons of tailings treated. The tailings yielded \$28,000, and the cost of treatment was \$15,500. The total estimated income was \$37,100, the expenses \$27,100, leaving a profit of \$10,000.

MADISON COUNTY.

At the Revenue mine, 13 miles east of Pony, fifty miners are working on the lower levels of the mine. Four tons of gold rock per month is the present output. The ore averages \$100 per ton.

At Rochester there are 113 men on the payroll of the Watseca and seventeen on each shift at the Elgin, near the Watseca. The Watseca owners are building a mill in which to crush the average grade ore. The company has one mill in operation. It is doing good work but its capacity is not sufficient. Considerable of the high-grade ore is shipped to Helena for treatment, the quantity aggregating about twenty tons per month. When the new mill is started it is possible that the entire product of the mine will be treated on the ground.

The Kearsarge property near Virginia City is yielding ore and is being developed systematically. A contract for sinking the shaft an additional 100 feet is let at a cost of \$8 a foot. The Kearsarge is under

lease and bond to W. B. Millard. Considerable of the ore of the property carries free gold.

MISSOULA COUNTY.

J. Day at Salteso started work on the Bryan property, which he recently bonded.

PARK COUNTY.

Anthracite coal is reported found near the mining camp of Contract.

The Unicorn group, Boulder district, has been sold to Colorado men for \$12,000. They will erect a plant when the property is thoroughly developed.

NEVADA.

ELKO COUNTY.

C. M. Spence is operating a new smelter at his Black Forest mine, Spruce Mountain district, southeast of Wells. The plant is closed down temporarily because of scarcity of water. While in operation it turned out 250 bars per week. The product is hauled from the mine to Wells or shipment.

ESMERALDA COUNTY.

Hawthorne reports that after a trial of two weeks the suit of the Southern Nevada M. Co. against the Holmes M. Co. is decided in favor of the plaintiff. The jury's verdict gave the Southern Nevada Co. possession of the mine and \$43,000 damages.

Tokop mining district is in Esmeralda county, 60 miles south of Tonopah. Assessment work is being done on a number of claims. Ledges from 18 to 24 inches in width, carrying as high as \$30 to the ton, have been discovered. The lack of water, which has to be hauled 9 miles, is the greatest drawback to development.

HUMBOLDT COUNTY.

W. G. Adamson has bought the Winnemucca mine, 5 miles west of Winnemucca.

LINCOLN COUNTY.

The Bamberger mines at DeLamar will have a 2000 H. P. plant. Power will be transmitted 14 miles. The new mill by January 1 should be treating 500 tons daily.

Ore from the E. & F. M. Co. at Pioche on controls shows 31.4% copper, 13 ounces silver, 40 cents gold per ton.

J. A. Denton says that the Clark railway people will have a thousand men at work in the county by the middle of November. In that section of the State construction work progresses more rapidly and easily in winter than in summer because of the climatic conditions and the better supply of water.

The Nevada Keystone Co., Sandy district, is working twenty men at the mine in rich ore. The company wants to buy the surrounding claims. The cyanide plant at Sandy is reported to be a success.

F. O. Wilkinson, who represents the Hearst estate on the Sandy, has at Manvel 13,000 pounds of machinery for the Green Monster claim.

J. D. Loop, near Good Springs, has samples of cinnabar ore running 2% and \$10 per ton in gold.

The stockholders of the April Fool M. Co., whose mines and mill at DeLamar were absorbed by the Bamberger DeLamar Mines Co., have been paid a dividend of \$200,000, or 40 cents a share, as proceeds of the sale.

LYON COUNTY.

The mill for the North Rapidan Co. at Como is in Dayton from Grass Valley, Cal. At Rockland the new 5-stamp mill erected by the Nevada Chief M. Co. is reported doing good work. Ore is being sacked from the 20-inch streak in tunnel No. 1 and averages \$100 per ton.

The Nevada Reduction Works is operating its cyanide plant at Dayton, capacity sixty-five tons daily, also the Heather cyanide plant in Six Mile canyon, fifty tons daily. The Reduction Works is also operating the Luzerne mine, above Silver City. The Rock Point mill has been idle on account of low water in the Carson river, but the stream is rising and the mill will soon be dropping its twenty stamps.

NYE COUNTY.

A U. S. geological survey of Tonopah, Nev., has been ordered by the department at Washington; it will begin November 1 under the direction of J. E. Spurr, who has just returned from Persia, where he has completed a survey for the government of that country. He will be assisted by W. J. Peters, who is now completing the survey in the Treadwell country, Douglas Island, Alaska.

The Tonopah & California G. M. Co., W. B. Sollender, manager, will work its nine claims east of the town of Tonopah.

At Tonopah the Fraction Co.'s triple-compartment shaft has a lead of ore at about 360 feet depth, about 900 feet from where they struck the ore in the first shaft.—The Tonopah Co. has a new lead 10 feet wide of rich ore in an upraise. They ran through 150 feet of poor ground on the 300-foot level and struck a lead of

ore in the southeast corner of the Mizpab claim, running due east.

The Pactolus Co.'s main ledge, the Twilight, has been uncovered for 500 feet in length, averaging from 3 to 7 feet. Assays from this ledge have run \$150 in gold and silver. The ore is free and readily pans. The formation is rhyolite porphyry, similar to the formation in Tonopah. The ore shows born silver and in places free gold. The property is at present tied up under option.

ORMSBY COUNTY.

J. P. Woodbury is overhauling and rebuilding portions of the Morgan mill, on the Carson river, near Empire. A cyanide plant will be in operation, a quantity of tallings being ready for the run. A 30 H. P. electric motor will be put in and power furnished by the Truckee River General Electric Co.

STOREY COUNTY.

The Potosi mine, regarding drill hole No. 2 on the Brunswick lode, which was abandoned after reaching a depth of 950 feet, says the hole passed through a width of 60 feet of vein material, consisting chiefly of quartz and spar, yielding assays of from \$2 to \$5 per ton. Grading preparatory to starting hole No. 3, at a point about 350 feet south, or on about the south line of the Potosi ground, is now under way. Contracts have been let for installing electric power at this point and the drill will be run by that power hereafter.

On the 1600 level of the Union shaft the joint Sierra Nevada and Union Con. east drift from the station has been advanced 14 feet in porphyry. The south lateral drift from the main west crosscut 294 feet in from the station is in 34 feet, with the face in vein porphyry. The south drift from the west drift, 390 feet in, is now 610 feet south of the north line of the Union Con. mine, with the face in soft porphyry and clay.

The Ophir M. Co. has received two bars of bullion of the gross assay value of about \$3800, being the returns from 191 tons of second-grade ore worked at the Douglass mill.

WASHOE COUNTY.

Near Reno A. E. Murdock of the Last Chance mine has arranged to continue work all winter.

The payroll at the Wedekind mine, north of Reno, averages \$4500 per month. There are sixty men employed on the Sparks property.

NEW MEXICO.

COLFAX COUNTY.

T. B. Harlan of St. Louis and J. Leahy of Raton have incorporated the New Mexico & Pacific Railway Co., to build line from Raton to Elizabethtown, 80 miles, the line ultimately to be extended to the Pacific Coast, following the thirty-seventh parallel. Chief engineer, O. H. B. Turner.

DONNA ANNA COUNTY.

The Modoc M. Co., 14 miles from Las Cruces, in the Organ mountains, is operating the Hooper pneumatic dry concentration process. The ore averages 20% lead and from three to ten ounces silver per ton.

GRANT COUNTY.

B. L. Berkey will treat the sulphides of the Orion Co., near Lordsburg. He has leased the concentrator belonging to the Lena M. & C. Co. and will add a leaching plant. He will put in one fifty-ton tank. The water level and permanent sulphides in most of the mines in the district are at a depth of from 200 to 400 feet.

LINCOLN COUNTY.

Near White Oaks the purchase of the Old Abe mine with the coal and all the property belonging to that company by the Eagle M. Co. has resulted in an increasing activity. The South Homestake mine has also been acquired.

Rich pockets are opened in the American mine at Nogal, one of the Eagle Co.'s group. One pocket produced \$5000 in wire gold and a large nugget was taken out of the other. Ore is being taken from a vein 3 feet wide in that mine which runs \$400 per ton. The company is running the Old Abe mine twenty-four hours a day.

OREGON.

BAKER COUNTY.

Sumpter says the North Pole mill is to be increased from ten to forty stamps. The frame of the Psyche 20-stamp building is finished. A new hoisting engine will be put in by the Virginia Co. in Greenhorn district. A wagon road is being built from Geiser to the Tempest mine. The main shaft of the Bonanza mine is down 800 feet.

Baker City reports the sale of the Baisley-Elkhorn mine to the Beaver M. Co. F. P. Hayes, formerly president and manager of the Bonanza mine, is back of the deal. The consideration named in the

deed is \$40,000 and the purchaser assumes all indebtedness and liens against the Baisley-Elkhorn. In addition to this purchase Mr. Hayes owns sixty-three adjoining claims. The work of opening up the property will begin at once. A tunnel 1 1/2 mile long is to be run, crosscutting all the claims. The contemplated improvements will cost \$250,000.

Near Geenborn, a new mining town, 26 miles from Whitney, at the Psyche mine, forty-eight men are employed. A new 20-stamp mill will be in running order Dec. 1. The Snow Creek has eighteen men running a tunnel and sinking a shaft.

Marshall Bros. are working sixteen men and running their ore through an arrastra. The Morning group is being worked by eight men. On the Belcher fourteen men are at work. The Olive Creek M. Co. has men crosscutting to the ledge. The I. X. L. has sixteen men at work. The ore averages \$15 to the ton. Next spring they will put up a mill.

Manager Parker of the Phoenix has twelve men at work and projects a 10-stamp mill next season. The Don Juan has sixteen men sinking. They expect to go down 200 feet. Manager Kennerly is putting up new machinery on the Gold Coin, including an air compressor, and will drive a 2000-foot tunnel. Eighteen men are at work in the Virginia. The mill building is under way.

The Gallagher group of nine mining claims, near Lookout mountain, are sold to May & Williams of Kansas City for \$40,000, 10% paid down.

Sumpter says the Dixie-Butte Mining & Mines Co. will build a mill plant to cost \$30,000—capacity fifty tons daily.

JACKSON COUNTY.

The High Line ditch, which has its terminus 440 feet above the depot at Gold Hill, is assured. The Ray enterprises have 130 men on the payroll. In the building of the Ray dam men discovered nuggets of various sizes. The gravel panned \$2. Rogue river was once known as Gold river.

The Bowden group of mines are sold to the Yellow Jacket M. & M. Co. F. Jordan is superintendent. The first payments of \$30,000 have already been completed and the final payment of \$10,000 takes place to-day. The property consists of four claims and the vein averages 3 feet. It has been developed to a depth of 150 feet. The company have a 5-stamp quartz mill. Twenty men are employed and \$500.00 will be spent in boiler, hoists and air compressors.

SOUTH DAKOTA.

LAWRENCE COUNTY.

At Deadwood an injunction has been issued restraining the Terry Peak Miners' Union from further interference with H. Collings, the foreman who was driven out of Terry. Collings has brought suit against the union for \$5000.

PENNINGTON COUNTY.

The Horseshoe M. Co. blows in their new smelter at Rapid City this week. It was built by the National Smelting Co. of Boston, being completed and started last spring; it ran for some time, but closed down for lack of ore. It was then bought by the Horseshoe M. Co.

At the Elkhorn yards, Deadwood, the ore is dumped from the narrow gauge cars to the wide gauge ones to be shipped to the smelter. The narrow cars which bring the ore from the mines are run upon a trestle, under which is built a standard track. The ore is allowed to go through the bottom of the cars, down chutes, into the standard gauge ore cars, which are then sent to the smelter.

UTAH.

BEAVER COUNTY.

Geo. E. Lane of the Success M. Co. will do development work on the promising property west of the Copper Mountain. The group consists of five claims which are traversed by four veins, croppings from which carry 7% copper. It is proposed to sink a shaft 450 feet at the intersection of these veins.

GRAND COUNTY.

Superintendent McBride of the La Sal M. & M. Co., at Cashin, on the east slope of the La Sal mountains on La Sal creek, about 30 miles southeast of Moab, says he will put in a large smelter, to be built at the mine, to handle ores from the La Sals, Big Indian and Lisbon Valley properties.

IRON COUNTY.

W. E. Ladd and R. E. Fosdill, representing the Colorado Fuel & Iron Co., are at Iron City, where, it is represented, they are securing iron deposits.

JUAB COUNTY.

Manager Josephs of the La Reine M. Co. has closed the mine down and levied an assessment of 1 cent per share to pay the indebtedness of the company.

P. L. Williams, to whom was referred

the \$1,000,000 claim of the Bullion-Beck M. Co. against the Eureka Hill for unlawful extraction of ore from the former's territory at Tintic, has found for the plaintiff and fixed the damages at \$105,953.

The Tribune says the contract system adopted by Manager C. E. Allen at the Centennial-Eureka is satisfactory. At present the payroll has 120 men thereon.

SALT LAKE COUNTY.

The Bingham Bulletin reports from the Ben Butler two more carloads of ore from its September shipments, making 400 tons of crude ore and concentrates. Twenty-eight men are employed. Indications are that October will beat the Butler's shipment record.

At the Nast, New England C. & G. M. Co., Superintendent Hazelgrove has at face of No. 5 raise from Nast tunnel 3 feet of lead ore.

The Mascot (Dalton & Lark) tunnel and air shaft are now connected; length of completed tunnel, about 4300 feet; remaining distance to Brooklyn vein—between 1600 and 1800 feet—will be driven.

A decree of foreclosure—judgment \$12,000—has been granted J. Nelson against the Copper Glance M. & M. Co. and Illinois M. Co., owning groups of claims between the Conger and Fortune mines.

SEVIER COUNTY.

The Salt Lake Tribune says P. A. H. Franklin will found a new camp south of the Annie Laurie, on Gold mountain. In prospecting Cottonwood gulch, overlooked by Mount Delano, he found the ledges numerous, with quartz identical with the gold-bearing quartz gold in Gold mountain, and bought or secured by option nearly 800 acres 4 miles south of Gold mountain.

WASHINGTON COUNTY.

The Silver Reef M. & R. Co., incorporated to work the tailings of the Barbee & Walker, Christy and Leeds dumps at Silver Reef, has machinery in operation.

At St. George the Utah & Eastern Co. has laid off most of the men at the mine and put them to work on the canal and road leading to the new smelter, and will rush the building of the new plant so that the Dixie may be a producer.

WASHINGTON.

FERRY COUNTY.

A rate of \$2.50 per ton has been made by the Kettle Valley lines for trial shipments of ore from the Republic mines to the smelters at Trail and Nelson, B. C. This rate, it is thought, will enable the Republic mines to extend the market for their siliceous ores.

OKANOGAN COUNTY.

McKeown & Wilson at Conconully have a 500-foot contract in the tunnel of the Mineral Hill M. Co. The tunnel is now in 563 feet, the additional 500 feet will give a vertical depth of 550 feet.

WYOMING.

CARBON COUNTY.

At Encampment the Rambler M. & S. Co. has incorporated and succeeds the Rambler C. Co. in the ownership and operation of the New Rambler mine, purchased for \$350,000. The new company has the mine, the newly installed smelter, the sawmill and two adjoining properties, the Isabella and the Strangler. By the purchase of these additional properties, the new company has 6000 feet on the vein in which the Rambler strike is located. The officers of the company are: President, F. B. Wootton, Madison, Wis.; vice-president, A. T. Holmes, Laramie; secretary, M. M. Green, Chicago, Ill.; treasurer, C. A. Jones, Laramie. The company will install air compressor drills and other machinery to do extensive mining.

FOREIGN.

AUSTRALIA.

Reports from the mines department of New South Wales show the export of silver and silver lead in matte, bullion and ores for the first six months of the current year was valued at £708,747, against £1,071,192 for the corresponding period of 1901, the decrease being £362,445, or about 33%.

BRITISH COLUMBIA.

B. R. Atkins, customs officer of Revelstoke, collected about \$2000 duty on the stamp mill for the Northwestern Dev. Co.'s Cambarne group.

Fairview reports that the property of the New Fairview Corporation, Ltd., has been sold in England for \$800,000, \$50,000 down, \$350,000 in three months, and the balance later. The company's chief mining property is the Stenwinder. Levels opened at 100, 200 and 300-feet respectively have developed a body of quartz ore.

M. F. Donahoe is manager O. K. and I. X. L. mines, near Rossland. The mines are in the hands of the Old National Bank in Spokane. Development work will soon be resumed. He says they are the only

free milling ore mines in that district and have the only 10-stamp mill there.

At Rossland, Gooderham-Blackstock interests, controlling the War Eagle and Center Star mines, have incorporated the Rossland Power Co., to construct and operate a concentrating plant on the principle now being tested on a commercial basis at the Silica Reduction Works by the same interests. Construction will not be started until next spring.

The Pacific Improvement Co. of San Francisco has sold to J. Dunsmuir its British Columbia coal properties. A. D. Shepherd, manager Pacific Improvement Co., says that negotiations for the transfer will soon be concluded. This company had not been anxious to sell out, he said, but a good offer had been made for its property in British Columbia and this offer had been accepted. The Pacific Improvement Co. is subsidiary to the Southern Pacific Co.

The Eva F. M. G. M. property on Fish river, near Goldfields, in the Kootenay, has been sold for \$300,000 to the Calumet and British Columbia mines, limited. The purchasers are English and Chicago men.

The Greenwood municipal council has decided to build a tramway to Phoenix.

From Rossland the Le Roi is now shipping \$50 ore to the Northport smelter.

LOWER CALIFORNIA.

The Peninsula M. & S. Co., incorporated in Los Angeles, is locally believed to be a subordinate corporation to the Amalgamated Copper Co. of New York, which is said to now possess, in the name of the Peninsula M. & S. Co., nearly all copper mines within 16 miles of the ocean in Lower California.

MEXICO.

Parral is now considered the largest producing mining camp in the republic, due particularly to the great quantity of high siliceous ores existing there. The Parral ores run about thirty ounces silver to the ton. The great excess of silica which the Parral ores carry would make them worthless were it not for the demand for them to flux the ores of the sections where the smelters are so short of that flux that they buy the ores of Parral and pay a premium therefor.

The annual report of the Mexican Central Railway for the year ending Dec. 31 shows that the company in handling its traffic received the Mexican silver dollar at 100 cents and paid some of its local expenses at the same rate. In remitting the balance of the earnings, the company received between 50.89 cents and 44 cents for Mexican dollars, giving an average for the year of 47.83 cents, as against 45.92 cents, the average in 1900. As late as 1896 the company received 53.17 cents, and in 1891 an average of 76.74 cents, U. S. currency, in exchange. The loss on the total revenue, which in 1901 reached \$17,125,340, Mexican currency, when changed into gold currency at 47.83 cents, is burdensome.

CHIHUAHUA.

The Las Vegas copper mines, near Coyame on the Rio Concho, are sold to Eastern men for \$85,000 gold. The Las Vegas mines have been worked for years and \$50,000 worth of ore has been shipped, and there are at present 3000 tons of ore on the dump. The owners had never been able to work the mines on an extensive scale owing to distance from the railroad and lack of capital, the wagon freight from the mines to Chihuahua being \$20 per ton, besides \$11 gold per ton for freight from Chihuahua to Aguascalientes and treating the ore. It is the intention of the new company to install modern machinery, and with the completion of the Orient road, which will pass within a distance of 6 miles of the mines, the property will become a large producer.

G. W. Boyce is manager Boston & Chihuahua Co., which will develop prospects in Terrazas.

The strike recently made by F. McDonald has added new interest. At the depth of 250 feet ore was struck, having a face 30 by 50 feet. The ore carries 45% lead and considerable silver.

A. F. Nathan, general manager Canrose syndicate of London, is in Minaca from Sierra Boluda. The Sierra Boluda gold mines will be developed by his company.

SONORA.

L. Ephraim, of Nogales, is manager of the Promontorio property, Magdalena district, 28 miles from Nogales. He will sink a 500-foot vertical double compartment shaft and will put in a new hoist capable of sinking 1000 feet.

The Rio Yaqui International Transportation and Metallurgical Co. has been formed by C. S. Thomas, L. M. Goddard, W. Faulkner, together with other Eastern and Western men. The company has possession of 18 mines in the Rio Yaqui valley, 125 miles from the Gulf of California, 175 miles southeast of Hermosillo. The mines are nearly 200 miles from a railroad and only the richest of the ore has been

shipped out. The plans of the new company include the building of a smelter at the mines or some nearby point. The company has also acquired coking coal land near Nogales, which the company will develop for its own use. From present prospects work on the properties and general operations of the company will be under way by Jan. 1, 1903. J. D. Blake is secretary-treasurer and V. Lucier, of Florence, Colo., will be in charge.

Three feet of \$40 free milling gold ore is reported by J. R. Mosley, 10 miles from Moctezuma, Sonora.

NEW SOUTH WALES.

Mr. E. J. Laughton, managing director the Block 14 mine, Broken Hill, says the property is to be closed down at once pending the reconstruction of the company. For four weeks of August the outlook from the Broken Hill Proprietary was 374,791 ounces silver, 4452 tons of lead, and 41 tons antimonial lead, as compared with 372,766 ounces silver, 44 tons lead, and 39 tons antimonial lead for the previous period in 1901.

The gold yield of Victoria for August was 85,687 ounces, compared with 76,205 ounces for August, 1901. The total gold production of the State for the eight months of the present year is 551,051 ounces, against 501,919 for the corresponding term in 1901.

SOUTH AFRICA.

The gold output of the Transvaal mines for August, 1902, is cabled at 162,750 ounces, an increase of 134,276 ounces over the corresponding month last year. From Jan. 1 to Aug. 31, 1902, the output has amounted to 968,771 ounces, against 81,600 ounces for the same period in 1901, 251,801 ounces for the corresponding months in 1900 and 3,502,048 ounces for a similar time in 1899. In the first eight months of 1898 the output was 2,697,917 ounces; in the corresponding months of 1897 it was 1,890,513 ounces.

TASMANIA.

At the Tasmania mine, Beaconsfield, Tasmania, 105 stamps are now installed and the plant is in a position to crush 1200 tons per week. The cost of milling during the half year was 4s 2½d per ton, concentrating is 2.99d per ton, and of chlorinating 3s 4.77d per ton; the total cost of the ore treated at the reduction works being 8s 10d per ton, out of total costs amounting to £1 14s 1½d per ton. The average of the ore treated during the half year was 16 dwts. 2.16 grs. per ton. That ore so far has only been broken down to the 818-foot level. The company has reached the reef in a crosscut at the 1000-foot level, and is now crosscutting at the 1100-foot level, above which point the manager estimates there are 300,000 tons of ore to be mined.

THE KLONDIKE.

A strike is reported on Duncan creek and there is a rush from Dawson. Three hundred dollars a day is said to be taken from one quartz claim. The scene of the strike is 60 miles from Dawson, in the Rockies.

Books Received.

Among the books received this week the most noticeable and the most deserving is Vol. X of "The Mineral Industry," for 1901. Considerable has appeared herein concerning the previous volumes, mostly commendatory, and there is in this present volume more to commend and less to condemn than is usual in a work of this kind. In noting any defect in such a volume the critic who has himself tried compilation of statistics is withheld from adverse remark by the realization of how difficult it is to secure uniform accuracy, and when he notes omissions, he is further aware of the mass of material that must be edited. Hence, the standard of criticism should be a lenient one, for the whole idea is deserving of praise, as it is an ambitious attempt to annually compile what is best in mining and metallurgical progress, and this advances the art. The writer believes the chapter, "Review of the Literature on Ore Dressing in 1901," to be the most valuable of the many valuable chapters in the book. The article on "Progress in the Electrolytic Refining of Copper in 1901," is deserving of special notice. The article "Progress in Gold Milling During 1901" deserved better treatment than it received, the article on gold dredging being a little weak. "Recent Improvements in Lead Smelting" is a notable article. The "Notes on Platinum and Its Associated Metals" seems to have been somewhat carelessly prepared. The new and growing subjects of electro-chemistry and electro-metallurgy receive fine treatment in a 23-page article that shows clever understanding of these subjects, and the progress of metallurgy—a matter of kindred interest and importance—has deserved place in pages

699-710. The miner, metallurgist, chemist or electrician will find much of interest in the volume, which deserves a place on the library shelf with its predecessors. It is edited by Dr. Jos. Struthers, and is published by the New York Engineering and Mining Journal, Incorporated. Price \$5.

Catalogues Received.

What is in many respects a model catalogue is received from the Pelton Water Wheel Co. of San Francisco and New York. It is of standard size—6x9 inches—convenient for shelf or binding, has a cover that is neither flimsy paper nor with the stiffness of rigid boards, but flexible and durable. Typographically, it is a gem, the halftone engravings from wash drawings being fully equal to the finest magazine work, and the paper, printing, embossed cover, making it such a book as one would like to have—all this, apart from its technical contents, profusely illustrated description of the Pelton water wheels and appurtenances, accounts of prominent installations, discussion of electric transmission, lists of concerns throughout the world using the Pelton wheel and the usual tables. The treatise will be sent on application to the Pelton Water Wheel Co., 125 Main street, San Francisco, Cal., or 143 Liberty street, New York City, N. Y.

The American Engineering Works of Chicago, Ill., sends its usual little bunch of booklets, this latest series relating to ore cars and prices current on a variety of mining supplies. These pamphlets are of convenience to intending purchasers, and will be sent to any address on request.

Personal.

JAS. F. WARDNER is in Rossland, B. C.

T. A. RICKARD has gone from Denver to New York City.

A. H. JOCELYN, of Denver, Colo., is visiting San Francisco.

GEORGE M. MIX is manager Oro Hondo M. Co., Deadwood, S. D.

S. I. HALLETT has returned from Aspen to Silverton, Colo.

J. W. MORGAN is foreman of Golden Gem mine, Cerbat, Arizona.

C. L. HANSON is manager California-Tonopah Co., Tonopah, Nev.

D. A. FREEMAN has returned from a California trip to Salida, Colo.

G. K. MCCORNICK has returned to Salt Lake City, Utah, from Europe.

GEORGE CROFT is superintendent Hudson mine, Red Mountain, Colo.

T. A. LISTER, president North American M. Co., is at Lordsburg, New Mexico.

R. S. BILLINGS is manager Rocky Mountain Smelting Co., Florence, Colo.

R. H. POSTLETHWAITE, of San Francisco, who has been seriously ill, is convalescent.

CURTIS H. LINDLEY has returned from the Cœur d'Alene mines, Idaho, to San Francisco.

M. K. GALUSHA, of Spokane, Wash., says he will start up the Jumbo mine, Rossland, B. C.

H. W. PAULSEN has resigned as superintendent Standard S. & R. Co., Val Verde, Arizona.

C. T. MIXER will have charge under the new company of the Creole property, Park City, Utah.

A. L. DICKERMAN, manager zinc plant, Park City, Utah, has returned there from Canyon City, Colo.

JNO. R. WILLIAMS has been re-elected president Chemical & Metallurgical Society of South Africa.

CHAS. GILLMORE has been appointed superintendent Vigor Powder Works, West Berkeley, Cal.

GOVERNMENT GEOLOGIST PITMAN has been appointed Under Secretary for Mines in New South Wales.

F. W. BAKER, chairman Stratton's Independence Co., and J. H. Hammond are at Cripple Creek, Colo.

B. A. LANGRIDGE, of Boulder, Colorado, is consulting engineer Baca Land Grant M. Co., New Mexico.

H. R. AYRES, Salt Lake representative of the Colorado Iron Works, has returned there from an Eastern visit.

T. W. BUZZO, superintendent Alice Co., Walkerville, Mont., has returned there from Salt Lake City, Utah.

W. S. WARD, commissioner mining and metallurgical department World's Fair, St. Louis, 1904, is in San Francisco.

J. P. BECKER is foreman of development work for the Mount Shasta Co. at the United Copper mine, Copley, Cal.

W. H. CRABTREE, secretary Home-stake M. Co., has returned to Anaconda, Mont., from a trip to California, where he

spent two months looking over the prospects of Placer and Sierra counties.

PROFESSORS BOWMAN AND KING of the Montana State School of Mines are visiting the mines at Rochester, Mont.

JNO. COSGROVE of Anaconda, Mont., has the contract for the erection of a mill for the Majestic M. Co. at Milford, Utah.

M. J. WELCH, late chief engineer Shannon Copper Co.'s plant, Clifton, Arizona, will take up construction work in Chicago.

J. G. ALLYN, M. E., of the firm of Mariner & Hoskins, Chicago, Ill., is near Walcott, Wyo., examining a gold mine for Chicago people.

J. W. GOODMAN, chief engineer the Creston-Colorado Co. at Minas Prietas, Sonora, Mexico, has returned there from Nogales, Arizona.

J. W. CAIRNS is manager Eureka-Ophir group, Dry Canyon, Tooele county, Utah. R. M. Hurst is manager Utah Queen M. Co., same locality.

E. MELARKEY, former superintendent Sheeptrall and Gold Road mines, Arizona, zona, is now foreman Quartette mines, Searchlight, Nevada.

W. H. THOMAS, former manager Niagara Co., Bingham, Utah, has returned there from California, where he has been examining mining properties.

A. F. ROSENBERGER has returned to Nelson, B. C., from the East, where he was successful in securing funds for the development of Camhorne properties.

E. A. HARDY of San Francisco has returned thence from Forest Hill, Cal., where he had been examining the Wisconsin mine, and which he will operate.

H. WITTEBORG, who until recently had charge of the Chamberlain-Dillingham sampler at Breckenridge, Colo., goes as manager of a mine at Los Cerillos, N. M., and takes charge October 15.

H. L. HAEHL and **W. L. EHRICH**, of the Wright-Gilman Co., have returned to San Francisco from a trip to Crescent Mills, Plumas county, Cal., where they have been examining mining properties.

WILLIAM MAGENAU, general superintendent for the Catherine Lead Co. of Fredericktown, Mo., who has been in New England and New York for the past month, has returned to the mines there.

Commercial Paragraphs.

COLORADO is shipping coal to Chicago.

F. G. STREET, 36 La Salle street, Chicago, has taken the Chicago agency for the France metallic packings and Force lubricating pump.

The Guarantee Electric Co., of which Mr. Chas. E. Gregory is president, has leased five big offices and manufacturing space in the building corner South Clinton and Adams streets, Chicago. The business of the company in electrical equipment for mines has increased greatly of late years.

The business of David Cumming, manufacturer of the Cumming portable forge, has become so large that extensions will soon be made to the manufacturing plant at Chicago. The improved Cumming portable forge is a durable and excellent machine, particularly for work in mines or smelters.

FAIRBANKS, MORSE & Co., Denver, Colo., report the following sales: Two 22 H. P. and one 34 H. P. gasoline hoists for shipment to Clear Creek county, Colo. They are just breaking ground for an addition to their storeroom, which will give them double the space they now have, to be completed January 1.

The Pyne Smelter, of West Alameda, Cal., has a railroad rate of \$4.50 per ton on copper ore going over \$30 from Wauhuska, Nev., to the smelter. The charges for working copper ore running over 10% are \$6 per ton. The company agrees to pay the New York market price less 4 1/2 cents—that is, were the market price 12 cents, the shipper would receive 7 1/2 cents. It would, consequently, not pay the miner to ship anything less than 12% ore.

On the 27th ult. the **J. George Leyner Engineering Works Co.**, Denver, Colo., incorporated to acquire the business of J. George Leyner, the rapid growth of the business necessitating enlargement of manufacturing facilities. The company will erect a new plant. The company capitalization is \$650,000. J. George Leyner, president and general manager; Luther H. Wygant, Jr., vice-president; Clarence A. Lawson, secretary-treasurer and business manager.

The Colorado Iron Works Co., Denver, Colo., report the sale of one set 27x14-inch rolls; one set 30x6-inch high-speed rolls; three impact screens, all sectional for mule-back transportation, for Deutz Hermanos, San Luis Potosi, Mexico; machinery for 40-stamp 1000-pound gold mill erected complete ready for operations near The Needles, California, for Mojave G. M. Co.; two sets of 40x16-inch latest design

belted crushing rolls for Economic G. E. Co., Victor, Colo.

The Salt Lake branch of the Allis-Chalmers Co. reports the principal sales for the month of September: Three plunger feeders for the Daly Judge M. Co., Park City, Utah; 80 H. P. return tubular boiler for the Bear Gulch M. Co., Montana; one carload of manganese wearing parts for Gates crushers for the Annie Laurie M. Co.; manganese roll shells for the Daly-West M. Co., Park City; twelve 6-foot Frue vanners for the Trent E. & M. Co.; six improved Chilean mills; one lot of duplicate and repair parts for 1000 H. P. compound engine; two No. 6 and two No. 4 Gates crushers and 12 feeders for the Bamberger-DeLamar G. M. Co., DeLamar, Nev.; carload of roasting furnace parts for the Con. Mercur G. M. Co.

The J. H. Parsons Chemical Co., of Chicago, are sending out a novelty in the shape of packages of volcanic dust from Mt. Pelee. The dust is from the original shipment made to this country and is a curiosity. The business of the Parsons Chemical Co. is reported to have more than doubled during the past two years. They say that with one exception they successfully treated all waters in which their compound was used in that time. Their specialty is with mines that have had feed water.

The representative of the Colorado Iron Works Co., Mr. Charles M. Hampson, has closed a contract for the erection of a cyanide plant at Pluma, South Dakota, for Messrs. Hall & McConnell. The well-known pneumatic process will be used. The plant will have a daily capacity of fifty tons, and will be equipped with six leaching tanks, two solution tanks, two gold tanks and two sump tanks. The Colorado Iron Works pattern zinc boxes will be used. From end to end the building will measure 86 feet. The width will be 44 feet. A 25 H. P. holler and a Leyner air compressor were specified by Mr. Hampson for the pneumatic process. Under the contract the plant is to be completed in sixty days. After working over the old tailings it is the purpose of the owners to run on custom ore.

The United Gold Fields Co. recently placed an order with the J. H. Montgomery Machinery Co. of Denver, Colo., for a tramway and complete mine equipment, including fifty cars, necessary screens and a large amount of track, etc., sufficient to handle the output of their coal mines in British Columbia. The proposed tramway will have a length of 3600 feet and its guaranteed capacity will be 100 tons per hour. The J. H. Montgomery Machine Co. will not only build this tramway but will superintend its erection and install all the necessary machinery to be used at the mine. The Cedar Hill Coal M. Co. have resumed operations at their mine near Trinidad, Colo. They have recently purchased thirty additional coal cars, and a large amount of track and other equipment from the J. H. Montgomery Machinery Co., Denver, Colo., thereby doubling their former output.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING SEPT. 30, 1902.
710,035.—ROCKING CHAIR.—C. A. Bergstrom, Tacoma, Wash.
710,037.—VALISE.—C. A. Bodwell, Jr., Lakeville, Cal.
710,246.—FIRE HOSE.—J. Buchtel, Portland, Or.
710,253.—BRAKE.—H. W. Cooley, Lost Valley, Or.
710,251.—VEHICLE AXLE.—J. H. Cooper, Madera, Cal.
710,317.—BOILER FEEDER.—C. Cummings, San Francisco, Cal.
710,147.—ROWING APPLIANCE.—N. B. Goodwin, S. F.
710,454.—DRYER.—I. B. Hammond, Portland, Or.
710,283.—CAR COUPLING.—W. S. Lennon, Tucson, Ariz.
710,180.—MANIFOLD BOOK.—A. Tevison, S. F.
710,329.—EXPLOSIVE ENGINE.—R. C. Marks, San Diego, Cal.
710,320.—CARBURETOR.—R. C. Marks, San Diego, Cal.
710,166.—HAY PRESS.—P. H. McVicar, Livermore, Cal.
710,164.—WRENCH.—M. M. Murray, Baxter, Cal.
710,334.—BOOM RIGGING.—F. V. Nielsen, S. F.
710,336.—GAS APPARATUS.—H. M. Papst, S. F.
710,077.—PIPE WRENCH.—C. C. Rueger, Butte, Mont.
710,078.—EGG STAND.—J. Salomon, S. F.
710,085.—POTATO SLICER.—L. L. Stevens, Los Angeles, Cal.
709,941.—OIL BURNER.—S. M. Trapp, San Diego, Cal.
710,125.—CURING FOODS.—C. B. Trescott, Portland, Or.
710,337.—BUILDINGS.—G. E. Voekel, Los Angeles, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE AXLE.—No. 710,251. Sept. 30, 1902. J. H. Cooper, Madera, Cal. Assignor of one-half to L.

Wilson, Merced, Cal. This invention consists in the formation of the axle with removable ends or stubs as they are called, and means for renewing these stubs and suspenders carried thereby so that whenever they are worn they can be replaced without the expense of cutting off and welding new ones upon the main portion.

PIPE WRENCH.—No. 710,077. Sept. 30, 1902. C. C. Rueger, Butte, Mont. This invention is an improvement in pipe wrenches or tongs and consists of a handle slotted at one end and a movable jaw pivoted in the slot, a fixed jaw on the handle in relation to the movable jaw, said jaws adapted to engage pipes of various sizes, the relation of the grip surfaces of said jaws being such that the angle between a pipe radius perpendicular to the engaged surface of the fixed jaw and a line from the center of said pipe to the center of the pivot of the movable jaw is less than 20 degrees.

Latest Market Reports.

SAN FRANCISCO, Oct. 10, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23 1/2 (standard ounce, 925 fine); New York, bar silver, 50 1/2c, refined (1000 fine); San Francisco, 50 1/2c; Mexican dollars, 43 1/2c San Francisco, 40 1/2c New York.
The steamship Sierra arrived in San Francisco on the 6th, from Sydney, with \$3,500,000 in gold. The specie was in sovereigns. It was one of the largest shipments of gold ever brought from Australia.

COPPER.—New York: Standard, \$10.60@11.00; Lake, 1 to 3 casks, \$11.50; carload lots, \$11.15; Electrolytic, 1 to 3 casks, \$11.40; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.40; carload lots, \$11.25. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £51 18s 9d spot per ton.

LEAD.—New York, \$4.12; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots, 4 1/2c 1000 to 4000 lbs.; pipe 5 1/2, sheet 6, bar 5 1/2c; pig, \$4.75. London: £10 15s per ton.

SPELTER.—New York, \$5.50; St. Louis, \$4.50; London, £19 7s 6d per ton; San Francisco, ton lots, 6 1/2c; 100-lb. lots, 7c.

ANTIMONY.—New York, Cookson's, 9 1/2c; Hallett's, 8 1/2c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$25.00; San Francisco, ton lots, 29c; 1000 lbs., 29c; 500 lbs., 29c; 200 lbs., 29c; less, 30c; bar tin, 30c, 35c. London, £115 5s spot.

PLATINUM.—San Francisco, crude, \$18.00 @ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £3 15s; San Francisco, local, \$46.00 @ flask of 7 1/2 lbs.; Denver, \$49.65. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6 1/2c; extra, 17 1/2c; genuine, 35c; Eclipse, 37 1/2c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 19c; San Francisco, Plumbers', 100-lb. lots, 16 1/2c.

NICKEL.—New York, 50@60c @ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.50; gray forge, \$20.00; San Francisco, bar, 3c @ lb., 3 1/2c in small quantities.

STEEL.—Bessemer hillets, Pittsburg, \$31 and \$31.50; open hearth billets, \$32 and \$32.50; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, \$2.45; K. B. & S., \$2.80; Hewmoor, \$2.75; Trowell, \$2.75; Portland, \$3.00 per bbl.

LIME.—Santa Cruz, \$2.00; Roche Harbor, \$2.00 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; lath, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.30; Cut, \$3.30; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 1/2c; less than one ton, 17 1/2c. No. 1*, 60%, carload lots, 13 1/2c; less than one ton, 15 1/2c. No. 1** 50%, carload lots, 11 1/2c; less than one ton, 13 1/2c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9c; less than one ton, 11c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet up.

CANDLES.—Granite 6s, 16 oz., 40s., 10 1/2c @ set; 14oz., 40s., 9 1/2c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$3.00. Cargo lots, Eastern and foreign: Wallsend, \$7.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$13.00; Rock Springs, \$9.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 93%-99%, jobbing, 27@28c @ lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66% B, 2c @ lb.; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 24@30c @ lb.; blue vitriol, 5 1/2@6 1/2c @ lb.; horax, concentrated, 7@8c @ lb.; chloride of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3 1/2@3 1/2c; California refined, 2@2 1/2c; nitric acid, in carboys, 8c @ lb.; caustic soda, in drums, 3@4c @ lb.; Cal. s. soda, bbls., \$1.25 @1.50 @ 100 lbs.; sks, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c @ lb.

OILS.—Linsed, hotted, bbl., 57c; cs., 62c; raw, hbl., 55c; cs., 60c; lots of 5 bbls., 1c less; Luboil oil, hotted, hbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13 1/2c; Mineral Seal, iron hbls., 19c; wooden hbls., 22 1/2c; cs., 25c; Mineral Sperm, cs., 26 1/2c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23 1/2c; 86° Gasoline, bulk, 21c; do., cs., 27 1/2c; 68° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 hbl., 95c; cs., \$1.05; Neatsfoot Oil, bbl., 75c; cs., 75c; No. 1 hbl., 52 1/2@55c; cs., 57 1/2@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6 1/2c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7 1/2c; in 25-lb. tin pails, 8c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2 1/2c per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6 1/2c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6 1/2c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8 1/2c.
BISMUTH.—Sunbrite, per lb., \$1.60.
BONE ASH.—4c @ lb.
BORAX.—Crystal, 7c; calcined, 25c.
CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 60c.

MAGNESIUM.—Per lb., \$3.00.

MANGANESE.—(90% and over) @ lb., \$1.25.

MERCURY.—Bichloride, @ lb., 90c.

MOLYBDENUM.—25c. @ gramme; 1000 grammes—2 1/2 lbs.

PHOSPHORUS.—(American) @ lb., 80c.

SILVER.—Chloride, @ oz., 75c; nitrate, 55c.

SODIUM.—Metal, @ lb., \$1.00.

URIANUM.—Oxide, @ lb., \$3.50.

ZINC.—Metallic, chemically pure, @ lb., 50c.

ZINC.—Dust, @ lb., 10c.
ZINC.—Sulphate, @ lb., .04c.
(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

American Engineering Works, CHICAGO, ILL.

We Will Send SAMPLES of Perforated Metal Screens.

Suppose you ask us for samples of such screens as you prefer. We make all kinds—Round Hole, Plain, Diagonal and Horizontal Slot. Indented Slot both Horizontal and Diagonal. We can make our closest quotations on specification of kind and number of sheets required. We also punch Tinned Screens. Get our circular No. 4. If you want to try a set of our screens we will make them for you at a special trial price. We know they are good, and we want every man who has a battery of stamps to have the same knowledge. We are bidding for your permanent patronage and will maintain the quality of our screens with the utmost care.

A COUPLE OF FACTS We Would Like You to Consider:

First, that our E style malleable iron bucket for ore elevators is the best bucket for the money. We drill it for bolts without charge; the material resists abrasion better than sheet steel and is disposed so as to give the greatest wear, being made thickest where the wear comes. It also resists acid water where steel is corroded.

Second, while the grade of iron required in making these buckets has advanced from about \$16 to about \$30 a ton, we have stock and will make scarcely any advance in price of buckets. We will be glad to quote you, or if you will send on your orders specifying how you want the bolt holes drilled we will make the price just as low, because we are bidding for your permanent custom.

Our general discounts on list of

Spiral Riveted STEEL PIPE

are large and liberal, but if you will send us your full requirements, lengths, sizes, pressures to withstand, fittings, etc., we will MAKE YOU A CONVINCING ARGUMENT IN PRICE. We make slip joints and riveted flange joints, but recommend most highly the flanged and bolted joint shown on page 16 of our catalogue No. 18 which we would be pleased to send you.

SPRING STOP COCKS.

We have a long list of customers who are well pleased with our AMEW spring cocks for compressed air lines. They stop the loss of power (often a serious one) by leakage where common cocks are used. Many other mines might use these at a saving. Is yours one of them? We would be glad to have you arrange to try them.

We make sizes $\frac{3}{4}$ ", 1", 1 $\frac{1}{4}$ ", 1 $\frac{1}{2}$ " and 2".

UTAH AGENTS: UTAH MINING MACHINERY & SUPPLY CO., SALT LAKE CITY.
CALIFORNIA AGENTS: RIX COMPRESSED AIR & DRILL CO., SAN FRANCISCO.

SITUATIONS WANTED.

Mining Engineer wants position as superintendent. Practical miner, millman, cyanide and assayer. Experience extending over twelve years. Graduate School of Mines. Address A. R. S. M., this office.

Cyanide Chemist, at present superintendent of cyanide mill, will be open for engagement after the 15th of October. Has been assayer of custom mill and mint. Ten years' practical experience of gold metallurgy in different countries. Address A. B. C., care Mining and Scientific Press, 606 Mack Block, Denver, Colo.

Have had eight years' experience as chief chemist and assayer for large copper smelting companies; since then have been in charge of mines and smelting operations. Would like a position with some good, reliable company; can give the best of reference. Address E. M. C., this office.

Situation wanted by a young mining engineer with a number of years' experience. Has served as accountant, superintendent of cyanide plant, assayer, assistant manager, etc., and is thoroughly conversant with mine and mill work. Position as manager or assistant preferred, though other offers would be considered. Address K. M. C., care Mining and Scientific Press.

COMPETENT SUPERINTENDENT wants position in California; 15 years' experience in running mines, mills and smelters for profit, and managing men. College bred and technically educated. Formerly held positions as assayer, mining engineer, accountant, superintendent, and manager. Member A. I. M. E. High testimonials. Address "Superintendent," Box 813, Seattle, Wash.

INGALLS, DR. A. O. E. M.
Room 17, Sullivan Building, 712 First Avenue,
Seattle, Washington.
Examinations and Reports on Mining Properties.
Investigations of Metallurgical Processes.
Correspondence Solicited.

WANTED.

WANTED.—BY TWO ENERGETIC AND EXPERIENCED mining men the acquaintance of persons interested in the development of mining property in old Mexico. Address D. L. C., care of this office.

WANTED.

SURVEYORS' TRANSITS.
Box 73, Stockton, Cal

WANTED.

Mine or Dump of REFRACTORY ORE,
on working bond or lease.
Address C. W. C., care of this office.

CASH BIDS on 20 Stamp Mill, complete, 1000-lb. stamps. Wanted, First-Class Millwright to erect the same. Wanted, First-Class Superintendent, Machine Drill Men, Miners and Timbermen, Mining Blacksmith, First-Class Electricians—Constructing, Superintending and Operating. Address "Gold Mine," care of Mining and Scientific Press.

BARGAINS.

30 Tons 35-lb. Iron Relaying Rail,
40 Tons 25-lb. Steel Relaying Rail,
50 Dump Cars, 18-in. to 36-in. Gauge,
3 Hoisting Derricks,
100 Horse Power Fire-box Boiler,
25 Horse Power Automatic Engine,
12 Horse Power Side Valve Engine.
S. D. BURNS, 318 BUSH ST., SAN FRANCISCO.

SMITH-VAILE Horizontal Triplex Pumps especially designed for MINE SERVICE.

This type of Pump is especially adapted where long discharge mains occur, as they discharge the water in a constant stream free from pulsation—a very desirable feature under the conditions mentioned.

The power exerted is nearly constant at all points of the revolution and consequently is the BEST TYPE OF PUMP for electric motor.

We also make STEAM AND POWER PUMPS for all purposes; FILTER PRESSES for filtering slimes and the separation of solids from liquids; AIR COMPRESSORS and VICTOR TURBINE WATER WHEELS.

IF INTERESTED, ADDRESS

The Stilwell-Bierce & Smith-Vaile Co.

P. O. B. 276. DAYTON, OHIO, U. S. A.

THE CRIPPLE CREEK REEL.

A New Device for Engineers' Long, Narrow Steel Tapes.

It was evolved from ten years' experience with all reels manufactured. The only reel invented that does not require a man with three hands to operate. It does not tire the left wrist to hold it or the right hand to turn it. You can lay it on the ground or hang it on a tree and pull out the full 500 feet, or stop it at any point and the tape will not unwind or tangle. The only reel with an automatic resistance on the tape itself and not on the spool. It is the lightest durable reel made. It saves broken tapes, time and profanity. Suitable for any make, any width, any length of tape. PRICE \$10.00.

PATENTED, MADE AND SOLD BY

V. G. HILLS & J. E. CHAPSON,

Box 1119. CRIPPLE CREEK, COLO.

MODERN MINING MACHINERY.

QUARTZ MILLS of any capacity,
IN UNITS OF TWO AND FIVE STAMPS.

Acme Amalgamators for Beach Sands
and other placer mining. Successfully applied to quartz mills in addition to or displacing stamps.

SUCCESSFUL GRAVEL MILL RECENTLY IMPROVED.
Special Gold Dredging Pumps and Machinery. Concentrators, Feeders, Rock Breakers and Power Plants.
Largest manufacturers of Irrigation and Reclamation Pumps in the United States.

Catalogues: No. 20, Pumps; No. 22, Beach and River Sands; No. 25, Mining.

Settlement of the Coal Strike.

If "in a multitude of counsellors is safety," then there should long ago have been a satisfactory settlement of the dispute between Eastern coal mine operators and miners, for thousands have counseled and worked, with no definite result till the President of the United States took a prominent part therein. The strike is in its sixth month, and the loss may be conservatively estimated at \$100,000,000. The most serious phase of a most serious situation is the tendency in high and low places to the theory that the Government has the right to take possession of the mines and work them for the public benefit. It is argued, and with great show of truth, that the question is of more importance to the public than to either party in the controversy; that coal is a public necessity, and that in the interest of the greater number the Government owes it to its citizens as a duty to see that coal is supplied in suitable quantity as required.

There certainly is as good reason in this case as was ever put forth why favorable argument should be made for public ownership of such things, but it is dangerous doctrine. In such a matter the question is not "Where shall we begin?" but "Where will we end?" and the end of all that is anarchy. Of course, if anarchy be deemed desirable, if Proudhon's dictum that "property is robbery" be our shibboleth, then let us all hasten to say so. If it be "a dreadful thing to be poor, therefore let us all be poor," then let there be no humming and hawing about it, but declare for universal poverty off-hand. Many may advocate hastening the reign of anarchy, but those who prefer the working of natural law in the business world will hesitate joining the ranks of willful destructionists.

The attitude of the operators till this week did much to make popular the idea that the right of eminent domain should be immediately exercised. That menace may be thought well to hold over them as a club, but the time has not come when the majority of thinking American citizens want to face the multitude of manifest evils that would result from universal dispossession.

The miners asked that they be guaranteed an increase in wages for men employed on piece work; a reduction in hours of labor for men employed by the day; payment for a legal ton of coal, and that coal shall be honestly weighed and correctly recorded. This is the sum and substance of their grievance. The operators now are willing to concede the point of arbitration, but disclaim any intent to deal with the miners as individuals. At the bottom of it all is plainly the feeling that the Eastern coal mine owners do not desire to recognize the Miners' Union representatives. Each

side has defied the law. The operators violated the Sherman anti-trust law and the constitution of Pennsylvania. The strikers have broken the statutory enactments against riot and personal violence. Partisans of each side condone the unlawful acts of those whom they favor.

With true American optimism, the most of us who are not coal mine owners or coal miners are glad to see so ruinous a war ended before further loss is occasioned. The thing will be patched up and coal got out to supply pressing public demands. But the sore is there and is not healed in any such way. Just how it can be healed is hard to say; not by government ownership—rather by the exercise of the homely virtues of justice and forbearance and the realization on both sides, and on all sides, of the rights and duties of the true American citizen. The whole thing is the bitter fruit of hossoms blown to us from across the sea. Both sides, impelled by a sense of common danger,

will get together and an armed truce will result, during which time the immediate needs of the miners and the public will be supplied. The idea in making editorial reference to the subject herein is to indicate the futility of using the matter as a reason for government ownership. True, it furnishes an excellent argument to those who look only at the present, but no argument can effectively plead for such perversion of public progress and human effort. That question is not one of sentiment, but of business economy. Whatever the Government does now costs more than twice as much what it would if done by private enterprise, and in that lies the insuperable objection.

The best and only form of "government interference" that can be advocated in this case is the creation of a government Department of Mines and Mining, with a cabinet officer at its head. That would not be governmental control, but would constitute governmental recognition, and would greatly aid in producing better relations between coal mine owners and coal miners. This last deplorable difference is one of the things that could be more largely obviated by such governmental department than in any other ordinary way.

The whole thing—viewed from that standpoint—affords one more tremendous object lesson for the need of a government Department of Mines and Mining. It is not thought that such a department could prevent such a gigantic strike as that which has paralyzed many Eastern industrial activities during the past ninety days, but its wise administration could go far toward smoothing and preventing the causes that make such strikes likely to occur. A government Department of Mines and Mining, rightly run, could do much for the metal and non-metal mining industry of the country, and its operation would be economical in helping to allay or avoid the conditions that occasion such industrial strife.

THE influence of mining on modern mechanical progress is noticeable. A century ago there was a wide gap between mining and engineering, or between metallurgy and mechanics. The necessity for pumping water out of a mine was the chief factor in the evolution of the steam engine, and, in return, the main factor in the development of the iron and steel industry was when the steam engine enabled air to be readily pumped into the blast furnace employed for the production of cast iron. The first railway was in a mine, and from that idea was evolved the great lines of railroad that traverse the earth.

MUCH has been said concerning Thos. A. Edison's experiments at Orange, N. J., on magnetic separation of ore and the subsequent extensive and expensive tests in New Mexico, which latter are reported as having been abandoned after the expenditure of several hundred thousand dollars. It is understood that the cessation by Mr. Edison of active work in that direction can not be considered wholly as an abandonment, rather as a temporary stoppage consequent upon present untoward commercial conditions. It is stated that the ore treated was found to be only 20% to 25% magnetic. The process consisted in separating magnetically, briquetting and reducing in the blast furnace. The cost per ton was 60 cents too high, but "the process might become valuable if the richer ores become scarce." The ore was contained in a hard granite. Phosphorus was present, and hence it was necessary to grind finely. Acid treatment had been tried, but it was necessary to dry the ore before it could be separated.

OREGON proposes this winter to establish a State mining bureau. It is a good idea. Every mining commonwealth should have such a State department. Every dollar so spent would be the means of inducing inquiry and development. This is an age of advertising, and no matter how good the wares of the merchant or how valuable the mineral resources of a State, both need proper publicity among buyers. Washington, Idaho, California, Colorado and Montana find it profitable to maintain such an institution, and Oregon could well profit by their example. That State is the possessor of great mineral wealth. Rightly run, an Oregon State Mining Bureau could induce investment, disseminate accurate information and be of great aid in a variety of ways to Oregon mining men. The Oregon Legislature could well appropriate, say, \$25,000 annually for the maintenance of a State mining bureau. Its good effects would be manifest and would be immediately noticeable. It is indirectly as much of an advantage to the farmer or lumberman or stock raiser or merchant as

it is to the miner to have such an institution. Mining is the great basic industry of the nation. The miner is a consumer of all products, a customer of all manufactures, and a competitor of none.

A Deterrent of Fraud.

The activity of the California State Mineralogist in inquiring into the truth or falsity of statements made by representatives of real or imaginary California mining property is the subject of some strong protest. It is represented that the sole province and purpose of the California State Mineralogist is to run the California Mining Bureau, wisely expend the public money, mind his own business, and let the private business of others alone.

This thing opens up an interesting field of discussion. The California State Mineralogist has certain duties prescribed for him, and among those duties as an executive officer it is not stated anywhere that he shall have anything to do in any way with sales of mining property, of investments therein, nor of passing upon the worth or lack of merit of any proffered stock.

Still, there are attendant circumstances that are worth considering in an impartial review of the State Mineralogist's "pernicious activity." He is a citizen of California, presumable of some intelligence, and supposedly a well-wisher of the commonwealth that has honored him with executive charge of the State's mining bureau. As such, it is his province and privilege, even though it be not his duty, to aid in the advancement and development of the State's mineral wealth, and as a loyal citizen, as a man of some intelligence, and as a citizen, he can in common with other good citizens do some good in exposing fraud wherever it may exist. He is not tramping up and down the State breathing fire and slaughter; but it is believed that in some notable instances he has exposed some mining schemes in which innocent and well-meaning people were saved some silly expenditure. In so far as this applies, it is our opinion that the State Mineralogist or anybody else deserves commendation and should be upheld and endorsed.

Of course, we are fully aware that there is no law in Iowa or Massachusetts or North Carolina to prevent anyone living therein making a fool of himself if he feel so disposed, and further, of course, there be those resident therein and elsewhere who abuse the privilege, and still further, of course, if these people are not skinned in one way they will be in another; yet it is not a good thing for any mining State to knowingly allow swindles to be perpetrated, and if any citizen thereof in or out of office can help in exposing such frauds he does the State a service.

The whole thing is a cold, selfish proposition. If fakes flourish, honest men ultimately lose opportunity for mining investment, being discredited and classed with the fakers by those who know no better; whether foolish clergymen or servant girls or factory employes lose their money is their lookout; but in the interests of the State such schemes as are dishonest should be repressed, just as a police officer would arrest a bunco steerer, or the town marshal lock up a backdoor thief. If the citizen occupying the California chair of State Mineralogist by reason of such fact is better able to check, with intelligent discretion, fraud, because of such occupancy, so much the better for the State.

THE large circulation of this paper in the Orient warrants the suggestion that manufacturers, merchants, exporters and shippers, men in general who expect to do business can get trade best by harmonizing most with Oriental ideas. The plans and ways that Americans adopt are excellent—for America—but trade with the Orient is best and quickest induced by compliance with Oriental ways. Of course, our way is the best; but if we want their business, we must conform to the customers' ideas to a certain extent. The swift hustle of business approach and capture which we so much admire and practice is viewed with suspicion by the Oriental mind in which the doctrine of delay prevails. Patience is an essential virtue in dealing with our trans-Pacific neighbors. From the American standpoint, slow beginnings and small profits are sometimes unworthy detailed attention, but it is from such diplomatic and delayed action ultimately arise larger profits and permanent trade so far as the Asiatic is concerned.

They are an ancient people with archaic ways, wise in their generation and slow to welcome innovation. Our breezy bustle stuns them. There is business there—abundance of it—but it can not be grasped immediately. The very qualities that make Americans successful among modern peoples repel the Oriental. It is a question of choice. If we want to sell goods quicker elsewhere, and the Oriental trade is too slow a proposition for Americans, well and good; but if we propose turning the Pacific ocean into an American lake and binding the Orient to us with the bonds of business, we must conform to the requirements of the party of the second part.

U. S. Patent Office.

The weekly illustrated descriptions of the latest mining and metallurgical patents have long been a feature of this paper. In this way our readers are fully abreast of current progress, invention and improvement therein. In this regard the magnitude of the business of invention is noticeable. The report of the commissioner of patents for the year ending June 30, 1902, shows that during that one twelve months were received at his office 53,107 applications. Those who sometimes wonder why their application for a patent is so long delayed may be interested in knowing that on that date (June 30, 1902) there were 11,042 applications still awaiting action in the patent office. When one considers the enormous number of applications and the limited capacity of the office, the wonder is that there were not more held up at Washington. Another interesting item in the report of the commissioner of patents is the line, "Letters patent withheld for non-payment of final fees, 4123;" and still another, "Applications allowed awaiting payment of final fees, 7448." Uncle Sam does business on a C. O. D. basis.

For the first time in any twelve months, for the year ending June 30, 1902, the number of applications exceeded 50,000. The receipts for the year were \$1,491,538 85, the expenses \$1,329,924.63, showing a surplus of \$161,614.22. The patent office is a constant source of revenue to the Government, and deserves better treatment. It has all along been self-supporting, but is continually pushed into a corner and made subordinate. Every commissioner for thirty years has begged for better quarters, increased office facilities, and clearly shown that it is not fair to inventors nor to the inventive genius of the nation to tax inventors to so great an extent as to make the office a source of profit to the Government, and yet he so stingy or neglectful in withholding required office room and facilities for handling the ever-increasing volume of business.

RECENTLY appeared editorial reference to the constant necessity of exact system in mine accounts, organized mine book-keeping for mining or metallurgical concerns of sufficient consequence to warrant the employment of such a system of checks and balances as would guard against mistakes or fraud. The need and manifest advantage of such a set of books is often made apparent. If reports from Cananea, Sonora, Mexico, be true, it would have been business for the Copete mine of the Cananea Con. Mining Co. to have had some such way of guarding against loss. According to reports from there, a steal involving \$30,000 has been discovered in the cashier's office and four employes therein are arrested. It is stated that in the Cananea Co.'s way of paying its men, which is a banking system, each employe is given a passbook—a cartero—in which he is credited with his work from day to day. The men are paid off once a month, and they can draw orders, called boletos, on the company's store agent. Their accounts in their carteros, these boletos, are payable to bearer. It is stated that there was no system of checking up these boletos against the hooks of the timekeepers, so that four young office employes conceived the plan of issuing boletos promiscuously and selling them, which they did at the ruling rate of 90 cents on the dollar. Four thousand dollars is alleged to have been traced against them, but it is stated that they have gotten the best of the company to the amount of about \$30,000. The discovery of the frauds was made by checking these boletos against the checkbook, which contained a correct list of the employes. The boletos showed only a lot of dummies.

Concentrates

So far as known Africa is barren of silver.

A CISTERN OR TANK $9\frac{1}{2}$ feet diameter, 12 feet deep, will hold just 200 barrels water.

FOR plating silver when batteries are used for circuit, the cyanide of silver is of general use.

THE absorption of small quantities of nitrogen by pure iron renders it hard and brittle like steel.

G. G. BLACKWELL SONS & CO., Liverpool, are English buyers of molybdenum and vanadium ores.

AT a depth of 1800 feet is found the highest temperature—72° F.—in the copper mines of Butte, Mont.

FIVE THOUSAND FEET of $1\frac{1}{2}$ -inch pipe, 4000 feet 2 $\frac{1}{2}$ -inch and 2000 feet 3-inch is equivalent to 20,380 feet of 1-inch pipe.

AN ounce of gold will buy three times as much now as when California's annual gold product was three times what it is now.

TO operate a hydraulic elevator with a 2-inch nozzle, there being 150-feet head, would require about 100 miners' laches.

BUT seventy-four more days remain to do the required annual assessment work on unpatented mining claims located since Jan. 1, 1901.

EPSOMITE is a growth of silvery white hairy substance, a crystallization from cinnabar in place when exposed to the air for some time.

GOLD AND TIN together in place is an unusual combination. The Royal Tasman mine, near Gladstone, north-eastern Tasmania, is cited as such a case.

AN arrastra beats nothing, but it is of no account for low-grade ore. How to build and operate one has been described and illustrated herein repeatedly.

WHERE twelve men are employed in a mine daily, and there is a perpendicular shaft or incline 300 feet in depth from the surface, the California mining law requires a second mode of egress therefrom by shaft or tunnel.

NO MATTER what definition is given the word "apex," it will be contradicted. Probably this will be contradicted as little as any: The part from the foot wall to the hanging wall at the top of the lode nearest the surface is the apex.

THE "pocket region" of Tuolumne county, Cal., is in the mineral slates that traverse and bisect the lime belt on the western slope of Bald mountain. But from the Stanislaus to the Tuolumne river are rich gold-producing mines of considerable depth.

TO carry 1000 miners' inches of water, total fall from inlet to outlet of 18 feet in a length of 600 feet, maximum depression of pipe below inlet 40 feet, the pipe should be 21 inches diameter. The velocity of flow of water in the pipe would be about 11 feet per second.

TWO HUNDRED FEET HEAD and 200 miners' inches water per minute would give, theoretically, 193.176 H. P. With 200 feet head and 400 cubic feet water per minute, the theoretical horse power would be 128.784. A head of 200 feet would give a pressure of 260 pounds.

THERE are several devices patented and unpatented to prevent the formation of fumes in mining powder. One patented by R. Crowe of Georgetown, Colo., some years ago consists of 50% unbolted wheat flour, 25% common salt (finely ground), and 25% pulverized bicarbonate of soda.

BARREL COPPER is native copper occurring in pieces of a size to be sorted out by hand in sufficient purity for smelting without mechanical concentration. Mass copper is the native form occurring in large masses. Ingot copper is the cast article in the form in which it comes from the molds.

AN assay is all right to determine the value of the piece of ore assayed, but to decide on the building of a plant at least one correct mill test is necessary. Even then further experiment and experience is necessary to determine the best way of working the ore; \$500 so spent is better than to take chances of useless expenditure of \$50,000 later on.

MINING MEN visiting San Francisco are invited to make this office, 330 Market St., headquarters. When visiting Denver the paper's representative will make them equally welcome in the commodious office at 606 Mack Block. When in Chicago, the central west manager will be pleased to see them at the paper's Chicago office, 737 Monadnock Block.

IT has been stated that electricity will develop "one horse-power" of energy for one hour at a cost of 1 cent, and that to develop the same energy with wood, coal or petroleum costs $3\frac{1}{2}$ cents per hour; but, like all those general statements, it may be true in one locality or under one set of circumstances and quite the reverse in another case. As a general rule, it is not correct.

AIR will flow from a tank having a gauge pressure of 100 pounds into a tank having a gauge pressure of 80 pounds through a short pipe connecting the two tanks at a velocity of 587 feet per second; when the gauge pressure in the tanks is 100 pounds and 60 pounds, 864 feet per second; when 100 pounds and 40 pounds, 1055 feet per second; when 100 pounds and 20 pounds, 1360 feet per second.

THE term "degree Baume," referring to oil, indicates its specific gravity. The higher the degree Baume the lighter the oil. Crude oil as it is usually found has a de-

gree of about 16° B., or a specific gravity of about 0.960. The illuminating oil has a degree of about 46° B., or a specific gravity of about .802. Gasoline has a degree of about 60° B., or a specific gravity of about .740.

IT is not considered that crushing to 30 or 40 mesh would give as high a percentage of extraction by simple amalgamation as crushing to 50 or 60 mesh. However, the size to which fine-milling gold ore should be crushed to yield the maximum profit is largely a local question for individual solution. And it is pre-eminently a question of profits. If there is more net profit in saving 90% than in saving 92%, the former would seem to be the best practice—from a commercial standpoint.

TO secure determination of silver in residuum from zinc distillation, a mixture of twenty grains of the coarsely powdered residue with forty grains of potassium nitrate and ten grains of sodium peroxide is dropped in portions of three or four grains into a red hot iron crucible. When the reaction is finished a sufficient quantity of flux (fourteen parts sodium carbonate, eight parts borax glass and two parts of cream of tartar) is added, and then ten grains of litharge. The lead button obtained from the fusion is cupelled in the ordinary manner.

ON an average the temperature of the air falls 1° for every 300 feet ascent above sea level. If the barometer stands at 30° at sea level it will indicate 29 inches at an altitude of 910 feet, and 28 inches at 1850 feet. At 16,000 feet the barometer would stand at 16 inches; at 30 miles high it would read .005 of 1 inch, and at 45 miles the barometric reading would be too small to be made, the air being too thin to produce sufficient pressure to be measured by a barometer. But in an extreme state of tenuity air undoubtedly exists 100 miles beyond the surface of the earth.

IF steam is at 100 pounds by the gauge (115 pounds absolute or total), its temperature is 337.68° F., and a pound of it contains 1184.9 heat units above 32° F. A pound of water at 32° F., if changed into steam at 100 pounds pressure, will receive 1148.9 units of heat, of which 308.5 units were given to it while yet water as the temperature was raised from 32° to 337.66° F., and 876.5 units have become latent in the steam as the pound of water at 337.66° F. was changed into steam at 337.66° F. A cubic foot of steam at 100 pounds pressure weighs 0.2583 pounds (about four ounces), 3.872 cubic feet weigh a pound, a cubic foot of water in the boiler at 337.66° F., weighs 56.18 pounds.

NO COMBINATION of wall rocks will insure a rich vein. It does not seem reasonable that gold should have been derived from the walls, for mines are equally rich whether in slate or at the contact of slate with greenstone. Good mines as well as poor ones can be found under either of these conditions. It seems more reasonable to believe that the deposition of the metallic particles is dependent more upon chemical reactions of a certain kind. Of two veins lying side by side in the same mine, one may be barren and the other constitute the pay rock. The rock forming the walls upon the surface or at any depth which can be reached is no indication of the nature of the deep-seated rocks from which the hot waters abstracted their mineral contents.

ALL original pyrites of small grain texture contain gold to a greater or less extent. Of course, this does not cover such secondary large crystal pyritous deposits derived from veins. It is not yet known whether the gold in this pyrites is in chemical combination with the sulphide of gold or whether each minute particle of gold is simply covered with a coating of sulphide of iron, or whether the particles of gold are in the metallic state, but alloyed with silver or other metal which combines more readily with sulphur than the gold does, and consequently forms a coat of sulphide of silver over the gold. The particles of gold are so minute, and the combinations follow so rapidly during the splitting up of these pyrites, that the finest instruments and tests known to chemistry have as yet been unable to settle this part of the question to the satisfaction of all concerned.

IN the manufacture of aluminum alloys containing aluminum, zinc and copper, a great deal of difficulty has arisen in providing a crucible which is not only proof against the alloy, but which will not injure it. It must be of such a nature that it will not alloy with the zinc or aluminum, and, furthermore, it must not have silicon in its make-up. A composition for lining crucibles which obviates the above objections consists of oxide of copper and the oxide of manganese in the proportions of one part of the former to four parts of the latter. The mixture is used by mixing it with water to form a paste, which is plastered upon the inner wall of the crucible to a depth of $\frac{1}{2}$ to $\frac{3}{4}$ inch. Before the oxide of manganese is used for this purpose, however, it is fused by submitting it to a temperature of 2000° C., after which it is reduced to a powder. The lining having been plastered in position, the crucible is dried and submitted to a baking process. This will partially fuse the oxide of copper, which will form a binder between the particles of manganese.

ALL material substances will conduct electricity. Some of them—as, for instance, silver, copper, aluminum, iron, lead and water—offer relatively little resistance to the passage of the current, and are, therefore, spoken of as conductors. Among these copper has taken the first rank in the manufacture of insulated wire and cables, because it combines in a higher degree than any of the other metals the qualities of ductility, strength and conductivity, with generally reasonable price and minimum size. Other substances—as, for instance, glass, porcelain, mica, gutta percha, India rub-

ber, dry air, cotton and jute yarn, paper, resin and hydrocarbons—offer so much resistance to the passage of the electric current that they are termed "insulators," and are all used in one way or another to insulate or prevent the escape of the electric current from the conductor. Thus electric wires on poles and house-tops are practically always attached to glass or porcelain insulators. Mica is used extensively in the manufacture of electrical apparatus, while yarn, paper, India rubber and gutta percha, because of their easy manipulation, are applied to wires for use in cables or inside of buildings, or overhead in cities when the current to be transmitted is one that would be dangerous to the public. The resins and hydrocarbons are used only for saturating the fibrous insulators.

IN all reciprocating engines there is an intermittent speed, the speed gradually increasing during the stroke until such time that the power applied is less than the mean power absorbed, after which the speed gradually decreases until steam is again admitted. It will thus be seen that in every single crank engine there is during each stroke or each half revolution a period of increasing speed and one of decreasing. With two cranks at 90° there will be four such periods during each half turn. With cranks set 120° apart there will be six such periods. The amount of fluctuation in speed is dependent on the number of cranks, the weight of the reciprocating parts, the length of the connecting rod, the proportion and adjustment of the valves, and the weight of the fly-wheels. It is desirable to keep this variation within certain limits on account of the parallel operation of the generators, but more particularly to insure the satisfactory operation of synchronous apparatus, such as synchronous motors and rotary converters, from such circuits.

DIAMETER of a circle $\times 3.1416$ = circumference; diameter of a circle $\times .8862$ = side of an equal square; diameter of a circle $\times .7071$ = side of an inscribed square; square of a diameter $\times .7854$ = area of a circle; circumference of a circle $\times .31831$ = diameter; side of a square $\times 1.128$ = diameter of equal circle; square root of an area $\times 1.12837$ = diameter of equal circle; square of the diameter of a sphere $\times 3.1416$ = convex surface; cube of the diameter of a sphere $\times .5236$ = solidity; diameter of a sphere $\times .806$ = dimensions of equal size; diameter of a sphere $\times .6667$ = length of equal cylinder; square inches $\times .09695$ = square feet; cubic inches $\times .00058$ = cubic feet; cubic feet $\times .03704$ = cubic yards; cylindrical inches $\times .0004546$ = cubic feet; cylindrical feet $\times .02909$ = cubic yards; cubic inches $\times .013607$ = imperial gallons; cubic feet $\times .6232$ = imperial gallons; cylindrical inches $\times .002832$ = imperial gallons; cylindrical feet $\times 4.895$ = imperial gallons; 183.346 circular inches = 1 square foot; 2200 cylindrical inches = 1 cubic foot; avoirdupois pounds $\times .009$ = hundred weight; avoirdupois pounds $\times .00045$ = tons; lineal feet $\times .00019$ = statute miles; lineal yards $\times .000468$ = statute miles.

ANY combination of metals or substances acted upon by acids so that the chemical action will produce electrical action may be called a primary battery. When wood is burned the carbon of the burning material combines with the oxygen of the air, and heat is given out as a result of the chemical combination, which we call combustion. In a similar manner if a piece of zinc be placed in some sulphuric acid, the acid combines with the zinc, and, as a result of the chemical combination, heat is given off. Of course, heat represents a certain energy or capacity of doing work. It has been discovered that under certain conditions the energy in this manner represented by chemical action is productive of electrical action, and, taking advantage of this, we get electric batteries. When two different metals are placed so that they do not touch each other and immersed in a liquid which will attack them chemically, one of these plates will become a positive pole and the other negative, to a current of electricity that will be produced by the chemical action and be caused to flow over a circuit which is connected to the exposed ends of the plate. A jar or vessel containing two plates thus immersed in a solution of acid or acidulated water is called an electric battery cell and the plates are called the electrodes of the cell. It is customary to speak of the electrode from which the current is flowing as the positive pole and the other electrode is known as the negative pole, the difference of electrical pressure between the two elements is known as the electro-motive force or voltage of the battery—that is, the current will leave the positive pole at a certain pressure or force, consequently will have the power of doing work in a circuit which is connected to the two plates of the cell. The current of electricity produced in this way not only flows from the positive plate to the negative plate through a circuit, but also flows within the cell itself from the negative plate to the positive one, consequently the negative plate will be known as the positive element of the battery, while the positive pole is known as the negative element. We might illustrate the action of an electric battery cell by saying that the cell performs the same function to the electric energy set in motion, as a pump would that had its discharge pipe connected to the point where the water is taken in, to the flow of water in the pipe. Now, if the pump be set in motion, it will force the water to circulate through the pipe and also within itself, the pump acting as the motive power of the circuit. Just so in a battery, electrical action is produced by the cell and the chemical action is the motive power of the circuit.

(Several questions and answers are given more extended notice on the next two pages.)

Some Questions and Answers.

(The following is an overflow from "Concentrates" page:)

Where can I find a market for graphite? What is its now worth?

Salida, Colo., Sept. 30.

The artificial production of graphite at Niagara Falls, N. Y., at a cost of less than 5 cents per pound, has so demoralized the market for natural graphite and made its production so uncertain as to profit that it is not possible to state that a profitable market for graphite mined in Colorado could now be found. Mined graphite brings from \$7 to \$18 per ton in New York City, variation due to quality.

Give a good example of where zinc dust is used in cyanide work. What are the appliances? That is, how is the zinc dust put in the cyanide solution? Please give a detailed account of the process.

Chicago, Sept. 27.

At the Golden Gate mill, Mercur, Utah, precipitation of the gold from the solution is effected by means of zinc dust. The material used is the blue powder by-product obtained in zinc smelting. The dust used by the company is imported from England or Germany, and contains about 90% metallic zinc. The solution is pumped from the gold solution tanks to the precipitation tanks, of which there are three. Thirty tons of solution is a charge for precipitation in each tank. While the tank is filling, air at ten to fifteen pounds pressure is blown into the solution through a half-inch pipe, keeping it in a state of violent ebullition. This is done to stir up the precipitate that has settled to the bottom of the tank from former charges, and which contains a large amount of unconsumed zinc. Five pounds of fresh dust is used for every charge of thirty tons, this amount being sieved in, beginning when the tank is half full, and continuing the additions at intervals until the tank is full and the zinc has all been added. The air pipe is then moved about the bottom of the tank for a short time, to thoroughly stir up all sediment again, and then removed, and the suspended matter allowed to settle about half an hour, when the supernatant solution is drawn off through an opening in the side of the tank 8 inches above the bottom, and as it still contains considerable quantities of suspended gold slimes, it is passed through the filter presses to collect these, and runs from them direct to the barren solution sump. It is seldom necessary to use pressure to force the solution through the presses, other than the head of 18 feet between them and the bottom of the precipitation tanks, but sometimes this has to be done when the presses become well filled with slimes, and for this purpose two pressure tanks of thirty tons capacity each are suspended beneath the precipitation tanks, and connected with them by large pipes, so that a tank of solution can be discharged into them in a very few minutes, and thence forced through the presses, and when it becomes necessary, the solutions can be banded in this way as rapidly as when the presses are free to work by gravity. The filtering medium used in the presses is two layers of light cotton flannel, between which is placed a sheet of heavy unsized paper. The precipitating and filtering operation is continuous, as while one tank is filling another is discharging and the third settling, and by this system as much as 2500 tons of solution has been precipitated in three tanks in twenty-four hours. The dust precipitate is almost instantaneous, being complete in a sample taken at once after the last zinc has been added. The precipitated solutions, after passing presses, rarely exceeds 20 cents per ton in value and are usually lower. The consumption of zinc dust is about one and a third pound per ounce of gold recovered.

In your issue of June 14, 1902, you state that there are about 2000 different minerals, but only forty of any importance to the miner. I would be pleased to learn the names of the forty you consider of importance.

Chemulpo, Korea, Sept.

Gold, platinum, iridium, silver, palladium, rhodium, copper, cobalt, nickel, iron, osmium, manganese, bromine, tungsten, tellurium, sulphur, bismuth, coal, antimony, water, lead, tin, zinc, carbon, potassium, calcium, sodium, quartz, granite, slate, mica, feldspar, mercury, aluminum, arsenic, silicon, lime, borax, molybdenum, diamonds and the host of precious stones, etc.

Please decide as to the date from which a mining location should commence in regard to doing the annual assessment work. Does it commence at date of location or at time of recording? In the case of a claim located Nov. 25, 1901, and recorded Feb. 25, 1902, does the work have to be done in 1902 or 1903? The State law here is to give ninety days from date of location to time of recording—that is, a 10-foot hole 4x6 feet must be finished before a claim can be recorded. Now, can this work be credited as part of the annual assessment?

Tonopah, Nev., Oct. 15.

The date from which time is counted begins at the location. Hence on the claim located Nov. 25, 1901, the \$100 of work or improvements required by the federal statute must be done before Dec. 31, 1902. If there were \$100 of work or improvements put on the claim before Dec. 31, 1901, that would hold it no

better than that amount done before Dec. 31, 1902; but whatever amount of work was done on the claim in 1901, there must be at least \$100 additional done between Jan. 1, 1902, and Dec. 31, 1902, to hold it from being jumped Jan. 1, 1903. This is fifteen pages of law boiled down.

We wish your opinion on the following: An undeveloped group of mining claims was sold by A to B, C and D. A makes deed of whole property to B without any reserve. B, C and D enter into an agreement with each other, specifying the interest of each in the property, and that B holds deed in trust for co-owners. A is not a party to the agreement, but it is specified therein that he shall have a two-twentieths interest in said mining claims, which interest is non-assessable and exempt from all development expenses. B, C and D incorporate, B deeding the eighteen-twentieths to the company and the remaining two-twentieths to A. The object of the company is not only to develop the said claims, but to secure and develop other mining properties also. In order to do this treasury stock in the company is sold, part of the proceeds applied to the development of the original claims and part used to secure new properties. Will the two-twentieths interest of A be valid in any new properties thus secured by funds realized from treasury stock of the company owning the eighteen-twentieths of the first property, it being understood that A has no stock interest in the company, but simply owns the other two-twentieths of the property originally secured?

Indianapolis, Ind., Oct. 8.

No. A does not appear to be in the corporation.

A has a mining claim that would become vacant January 1, 1902. He relocates it and does the required work in December, 1901. Has he a right to do the location work before the claim becomes vacant for 1902, and will it stand law?

Alamo, Or., Oct. 9.

Yes, be has, and it is legal. He didn't need to "relocate" it. Doing the assessment work within the required time was sufficient.

Kindly tell me how many horse power will 200 inches of water develop with 30 feet fall. How do you figure it?

Jackson, Cal., Oct. 4.

The horse power for 1 miners' inch with 30 feet head is (theoretically) .072441. For 200 inches it would be .072441 \times 200 = 14.4882 H. P.

I have a copper property here that I think could be treated profitably by the leaching process or wet extraction. What is a good method?

Copper Mountain, Alaska, Sept. 13.

As in all cases, whatever the metal, so much depends upon individual circumstance and local conditions that little can be said except in the most general way. If your ore lies in a limestone contact there will no doubt be considerable soluble lime in the ore, probably much in the shape of garnet epidotes and similar minerals. The cost of leaching is naturally increased by the presence of these minerals, as they absorb the solvent to a greater degree than the copper itself.

The Coconino Copper Co. at Ryan, Ariz., has a plant reported to be in successful operation. They claim to be saving better than 92% of the copper at a cost to them for mining, hauling, milling and refining of 5 cents per pound of copper. Their ore is in a sandstone formation, but they have to haul their sulphur 170 miles in wagons. If you have iron or copper sulphides at hand you can get the sulphurous acid from them at comparatively small expense by roasting, but if you have to import brimstone to make the sulphurous acid the presence of much lime would be fatal to any acid leaching process. In such case there is the possibility of leaching the ore with ammonia gas. J. W. Neill, Salt Lake City, Utah, has a patented apparatus for leaching limestone ore with ammonia gas. This method, however, presupposes good ore, as the ammonia is somewhat expensive. Neill & Burfeind, Salt Lake City, Utah; the Santa Rita Copper Co., Santa Rita, N. M., and the Black Warrior Copper Co., Black Warrior, Ariz., are reported to have made a practical success of wet leaching of copper ores.

I would like to get some good formula for the assay of cyanide solutions. Kindly furnish one or two new ones.

Rapid City, South Dakota, Sept. 30.

Several such formulas have appeared herein. What is considered to be a good formula for such work appeared near the bottom of the second column of page 58 of the issue of August 2, 1902. Herewith are appended two other ways collated from Gaze's "Practical Cyanide Operations":

(a) Mercuric Chloride Test.—1. Prepare a solution of mercuric chloride in water 100 grains to 1 ounce; keep in glass stoppered bottle. 2. Take 8 ounces or 10 ounces of solution to be tested accurately measured. 3. From a burette run in mercuric chloride solution to excess, i. e., until a drop of mercuric solution produces no further precipitate. 4. Filter, wash the precipitate, dry. 5. Flux with same fluxes as for evaporation test in a small crucible in the muffle, pour. 6. Detach lead button; cupel in hot cupel. 7. Weigh fine bullion, part; weigh gold, and calculate 8-ounce or 10-ounce assay table, according as 8 ounces or 10 ounces were used.

(b) Zinc Dust Method.—1. Carefully measure 8 ounces or 10 ounces of the solution to be tested; to this add 20 drops of bicarbonate solution. 2. Run in

strong nitrate of silver solution until the deep red color of chromate of silver appears; this shows the consumption of all cyanide and precipitation of gold and silver as argentic auric cyanide. 3. Add 100 grains of zinc dust, mix thoroughly. 4. Add sufficient H_2SO_4 to dissolve all the zinc, when all evolution of hydrogen has ceased. 5. Filter, wash the precipitate, dry. 6. Wrap the precipitate in lead foil; place in hot scorifier, melt, pour; place in cupel. 7. Dissolve all silver out with HNO_3 ; weigh and calculate the gold.

I own a one-third interest in a mining property that is fairly productive and want to know if I can be froze out against my will. Can my mining partners break up the partnership and have the property disposed of?

Los Angeles, Cal., Oct. 5.

This is a hard question, being one of law as well as one of fact. Our inquirer doesn't tell us enough. However, probably if he went into details the matter would require the opinion of a first-class mining lawyer.

In the first place there is considerable difference between an ordinary business partnership and a "mining partnership." Under the assumption that the mining property is in California, it is to be noted that under the California Civil Code (section 2511) a mining partnership exists when two or more persons who own or acquire a mining claim for the purpose of working it and extracting the mineral therefrom actually engage in working the same. An express agreement to become partners or to share the profits and losses of mining is not necessary to the formation or existence of a mining partnership. The relation arises from the ownership of shares or interests in the mine and work of the same for the purpose of extracting minerals there.

Section 2516 of the California Civil Code says that one of the partners in a mining partnership may convey his interest in the mine and business without dissolving the partnership. The purchaser, from the date of his purchase, becomes a member of the partnership.

Just what the trouble is in this particular case is not stated by our Los Angeles inquirer. The law presupposes a remedy for any wrong, but the nature of the "mining partnership," as set forth, appears to make it possible to have any one "butt in" as a "partner," if he can buy a share in the property, and if he or any of the dissatisfied "partners" for any reason want to make trouble the Civil Code seems to give plenty opportunity. In the case of Fisher vs. Superior Court, vol. 98, page 67, Cal. Reports, the Supreme Court of the State of California decided that a court of equity had the power to appoint a receiver of the property of a mining partnership because it was alleged that the property was the property of an alleged mining partnership, and because one of the partners had obtained advantage over his co-owners (and partners) in the purchase of interests, and those partners might bring a suit to dissolve the partnership and ask for an accounting and an order for the sale of the property. A case of somewhat similar import is reported in Grant Co., Oregon, mining news, in the department of Mining Summary, on page 228 of this issue.

This answer is not intended to be other than suggestive, and our inquirer would do well, if the matter is of much financial importance, to get good legal advice, and be governed accordingly.

Does the temperature of the water used have any effect on gold amalgamation? If it does, which is the better—hot or cold water? Are there any records of experiments or proof in that direction?

Rapid City, S. D., Oct. 10.

Considerable has been published in this paper from practical mill men going to show that the temperature of the battery water has much to do with gold amalgamation and that warm water tended to produce better effects than cold.

One mill man, writing from Baker City, Or., gives in detail the results of experimentation in that direction. The water used at Baker City came from the mine at a temperature of 120°, and by the time it reached the batteries was not less than 90°, so that the test was compulsory and comparison was not possible. It was observed in this case that there was an unusually close saving for pyritic ores. The ore milled from \$10 to \$25 per ton, the average for the year being about \$12. The tailings assayed from 40 cents to \$1 per ton, very seldom exceeding the latter figure, and then only when unusually rich ore was milled. The average assay of the tailings did not exceed 60 cents per ton, showing a saving of 95%—a very good showing considering that the ore carried a fair percentage of iron pyrites. As high as 90% of the gold saved was found in the batteries, and much less mercury to the ounce of gold was fed than with cold water. Similar results were obtained on the vanners used for concentration.

In another mill in Oregon a saving of 90% was effected with water at 80°, as against a saving of 80% with the water at 60°, while the concentration was greatly improved by the use of the warm water. This experiment was a good test of the relative merits of warm and cold water, as the water could be readily changed from ice cold to hot.

Another writer on that subject mentions a mill in Australia in which warm water was used with a less

loss of mercury than in a neighboring mill in which water of the ordinary temperature was used. This, however, was attributed to the time used to take up the grease in the water condensed from the exhaust steam of the engine, which was allowed to mingle with the battery water. Placer miners sometimes find that their gold will not amalgamate in cold weather. The placer miners in the Snake river have noticed the same thing and use hurlaps in winter and amalgamated plates in summer.

We are working in quartz loose on the surface, containing about \$7 gold per ton, and are running it through a No. 2 Gates crusher, and from there into a 5-stamp mill, grinding it out to a forty-mesh and trying to get the values by free milling. We have a copper plate in the mortar in back, front and ends or sides, all well coated with quicksilver; outside we have a drip plate, lip plate, about 5 feet of apron plate, all plates except the small end or side plate being silver plated. We started up about two weeks ago and were doing well for the first two or three days. The amalgam was forming nicely on the plates, but we met with the misfortune of getting our front plate (inside) broken loose, and, before we knew it, it was all broken up and parts of it pulverized by the stamps. We put in a new plate at once and cleaned out the mortar; but, on going to work again, our plates all became brassy in appearance, at first gradually getting darker and forming a coating on the plates, the amalgam becoming dissolved and carried away. What I want to know is, How can I remedy the trouble? I have cleaned the plates several times with a weak solution of cyanide of potassium, also with a little sulphate of iron added, but the trouble continues.

Copperas Cove, Texas, Oct. 1.

It seems to be a fact that for two weeks after the start of a new mill the gold amalgamated readily and all the plates kept bright. It is stated that after the destruction of the front chuck block the mortar was thoroughly cleaned out, and it is to be supposed this pulp was not refed into the battery. Pieces of copper will not tarnish silvered plates, or the caps from the blasting, rivets, etc., would keep any mill in poor shape. The tarnishing brassy at first and growing darker indicates grease. If no retaining drip pans are put under dropping grease, which thus mixes with the ore in the feed bin, and if no canvas or other protection is placed under the cams to catch the drip from going directly into self-feeder or mortar throat, or no cleanliness is exercised in wiping off stems or other greasy places, such trouble will ensue. It were also well to examine the feed water and tank and all other sources where contamination could occur after two weeks' running. Tellurium and selenium give dark stains very rapidly; manganese will prevent the amalgam forming, or some trivial cause easily remedied. However, as these should have shown during the first two weeks, possibly lack of cleanliness and presence of grease is the cause. If a journal has been beaten, so as to get babbitt metal or solder in the mortar, the plates would become coal black and slimy.

What is the best method of assaying gold for coining purposes? If practicable, give the technical way. Are there any short cuts in that kind of work? How is the matter regulated for the estimation of metallic gold? Please give formula for calorimetric estimation of gold, likewise in dilute solution.

Golden, Colo., Oct. 1.

The technical assay of gold for coining purposes is invariably performed by cupellation. Tetrachloride of gold is largely used. To ascertain the strength of a solution of the chloride, or its value: If to a solution of gold in the form of chloride (free from nitric acid and the free hydrochloric acid nearly neutralized by ammonia) an excess of oxalic acid be added, in the course of from eighteen to twenty-four hours all the gold will be precipitated in the metallic form, while the corresponding quantity of oxalic acid has been dissipated in the form of carbonic acid. If, therefore, the quantity of oxalic acid originally be known, and the excess, after complete precipitation of the gold, be found by permanganate, the amount of gold will be obtained. A more rapid method consists in boiling the neutral gold solution with an excess of standard solution of potassium oxalate containing 8.3 grams of the pure salt per liter, and titrating back with a permanganate solution which has the same working strength as the oxalate. Each cubic centimeter of oxalate solution represents 0.00655 gram Au. The estimation of small proportions of gold in solution can be done by iodine and thiosulphate, as shown by Petersen. The method has been verified by Gooch and Morley. These chemists found that the reduction of the auric salt with the consequent liberation of iodine was somewhat influenced by the volume of the solution, the amount of iodine present and the time of action. Their experiments showed that the best effects were obtained in a solution of pure gold chloride of about 0.8 gram of the salt to the liter by using 0.1 gram KI to volumes of the chloride ranging between 25 and 50 cubic centimeters. The iodine and thiosulphate solutions used were about $\frac{N}{100}$ strength, verified against each other. The solution of KI contained 10 grams per liter. Process: The gold solution is measured from a burette and the potassium iodide added in the proportions above mentioned. There must always be enough of this to more than redissolve the aurous iodide precipitated at first. A clear solution of starch is then added,

and the blue color produced by it is just removed by thiosulphate. The standard iodine is then added until the liquid assumes a faint rose color and the amount of gold is obtained. Of course, the gold value of the standard solutions must be known by experiments upon a known strength of pure gold solution. For very small quantities of gold $\frac{N}{1000}$ solutions of iodine

and thiosulphate may be used with good effect, but in this case a correction of 0.1 cubic centimeter for the iodine must be allowed for volumes not exceeding 30 cubic centimeters of gold, because that is the amount required to bring out the rose color in a blank experiment. In the practical use of this process for the estimation of metallic gold the metal can be got into solution by chlorine water or aqua regia, but in the removal of the excess of the oxidizer by evaporation it is difficult to prevent the formation of aurous chloride. By adding ammonia in excess to the solution, boiling gently, acidifying with HCl, and heating, if necessary, to redissolve the precipitate by ammonia, again treating with ammonia and heating, and once more acidifying, the ammonium chloride so formed apparently acts in holding up a clear solution ready for titration.

For a colorimetric estimation of gold in ores: Place 100 grams of the ore (or less if more than a trace of gold), and heat it in a stoppered bottle for some hours with 10 cubic centimeters of bromine and 100 cubic centimeters of water. Then filter off the liquid and wash the residue several times with water. Evaporate the filtrate till it no longer smells of bromine. Make it up to 100 cubic centimeters and raise it to boiling. Place $\frac{1}{2}$ cubic centimeter of a fresh saturated solution of stannous chloride in a beaker and rapidly pour upon it the boiling extract. A precipitate will form and sink to the bottom. If no gold be present the precipitate has a slight bluish tint. Gold causes it to be purplish red to blackish purple, according to the quantity of gold present. The gold is estimated by taking small quantities of standard gold solution, making up to 100 cubic centimeters, boiling and pouring into stannous chloride, exactly as was done with the ore extract. In this way the gold can be approximately estimated. The gold present should be between 0.0001 and 0.00002 gram. If there be more than 0.0001 gram a more dilute extract of ore should be prepared. If less than 0.00002 gram be present a larger quantity of ore should be used. Estimation of gold in dilute solutions: Gold may be estimated by the above process in solutions which may contain as little as one part by weight of gold to 5,000,000 parts of water. The following table gives the volumes of solution which must be used according to the quantity of gold present: Gold per liter of water, $\frac{1}{2}$ milligram, volume to be used 100 cubic centimeters; $\frac{1}{10}$ milligram, 500 cubic centimeters; $\frac{1}{100}$ milligram, 1000 cubic centimeters; $\frac{1}{1000}$ milligram, 3000 cubic centimeters. The proper volume of solution is raised to boiling and poured upon 10 centimeters of a saturated solution of stannous chloride. The gold is estimated by taking small quantities of standard gold solution, making up to the same volume with boiling water and pouring into 10 centimeters of the same stannous chloride. For stronger gold solutions the following process may be used: To the solution of gold chloride add some drops of arsenic acid solution, then after a time two or three drops of dilute ferric chloride and some hydrochloric acid. If the liquid be too acid the reaction fails and only a faint blue color is seen; if not acid at all a flocculent precipitate results. Make up to 100 centimeters, add a pinch of zinc dust and shake. A coloration is produced from rose to purple. Limits 0.001-0.0001 gram.

Of what is the fine filament of an incandescent electric light made? How are these filaments made ready for use?

Tuolumne, Cal., Sept. 26.

To form the filaments a solution of cellulose is squirted through dies, emerging in the form of fine threads, which, when dried, are tough and flexible. After being formed into the shapes desired for use in the lamps, the threads of cellulose are packed in crucibles with carbon dust and subjected to intense heat for many hours, which completely chars the cellulose and leaves only the carbon skeleton of each thread. The filament is next suspended in an atmosphere of hydrocarbon vapor, at a pressure reduced below that of the atmosphere, by means of an air pump. There is passed through the filament for a half second a current of electricity strong enough to make it incandescent. The hydrocarbon vapor is thus decomposed, carbon in a form resembling graphite being deposited on the filament. Before treating, all filaments vary in diameter. At points of smaller diameter the resistance is greater, and more heat is generated than at other parts of the filament. These points, being at a higher temperature, would disintegrate and break long before the rest of the carbon had served its useful life. During the process of treatment these hotter portions decompose the vapor more rapidly than the rest of the filament does, and in this manner they are built up by deposited carbon. The result of this process is that the thread now possesses a uniform structure.

As oxygen in any quantity is a supporter of combustion, it is necessary that the carbon filament be burned in a vacuum that its life may be as long as

possible. Accordingly it is necessary to exhaust all the air from the bulb of the lamp, and to conduct the electric current through the glass by means of an air-tight joint. This can be satisfactorily accomplished by the use of platinum, to which fused glass adheres very firmly, and which has the peculiar characteristic that in cooling it contracts at the same rate as the cooling glass. Many other metals and compositions have been experimented with, but it has been found that the different rates with which the glass and metal contracted either caused the glass to crack or would leave a minute space between the platinum and the glass, which would allow the entrance of sufficient current to very quickly deteriorate the service of the filament. Platinum being a very expensive metal, it is desirable to use as little as possible. Hence short pieces of platinum wire are fused to the ends of longer copper wires. Two of these platinum tips are then fused or sealed into the end of a bit of glass tubing having a flange spun on one end, from which the copper wires are left protruding. This combination is now called the mount or stem. A nickel wire is fastened into the fused end of the glass tube between the platinum wires in mounts which are intended for loop filaments. This nickel wire serves as an anchor to prevent excessive vibration and consequent breakage, as well as drooping of the carbon when placed in a horizontal position. The glass is now plastic and firmly amalgamated with the platinum leading-in wires. The filament is next fastened to the mount by means of a special composition which will stand a red heat, and which will give off no gases when the lamp is burning. Over this paste is deposited a layer of carbon similar to the carbon deposited during the treatment of the filament. In this case the filament is locally heated at the point of union with the platinum in a bath of liquid hydrocarbon. This deposited carbon ensures a joint that is both mechanically and electrically perfect. The filament is now anchored, except in lamps having short, stiff carbons requiring support. The anchoring is accomplished by bending the end of the nickel wire into a small hook and placing in this the loop of the filament, holding the latter in place by means of a drop of the composition already referred to. The mount is then placed in an oven to dry the paste thoroughly. The filament is straightened by bending the platinum leading-in wire and the anchoring wire then sealed into the bulb.

Could I use the current from an electric light and power plant for setting off shots? If so, what would be the best arrangement for the connecting wires, etc.?

Delta, Idaho, Oct. 3.

No instance of such use comes immediately to mind in writing, but a similar question to this paper was thus answered a few months ago:

"In mines where there is a source of electricity always available for lighting, power, etc., current can be taken off the mains for shot-firing purposes. This is a simple and convenient plan and can be used especially in shaft sinking. Caution requires, however, to be exercised or accidents may occur, chiefly because the electric current is a continuous one and there is always, therefore, the risk that, owing to some leakage, a current may be generated in the firing circuit and because the current strength is usually greatly in excess of what is required for shot-firing. The conducting cables should be well insulated and should never be connected to the wires of the fuses until all is ready for firing the shot. It is, moreover, best not to trust to an ordinary simple firing circuit, but to use a bi-polar switch, which insures that neither of the cables of the firing circuit is in electrical connection with the mains until the shot firer throws the switching, when both cables are simultaneously connected with the terminals from the mains."

I have heard charcoal recommended in place of zinc in cyaniding. Has it any advantage over zinc, and in what general way? Is it cheaper?

Telluride, Colo., Oct. 5.

That depends on what one would call "cheap." In some cases it is. The question, like all general ones in ore treatment, is not susceptible of direct or detailed reply. Whether charcoal has any "advantage" over zinc is a local issue. In ordinary mill work the charcoal consumes considerable cyanide. There are instances (where cyaniding is the right kind of ore treatment) where an extremely dilute solution is sufficient, or in the case of tailings that consume a good deal of cyanide, in which charcoal is of advantage. Cyaniders instance cases where charcoal has precipitated 94% of solution values. It is fairly credited with ability to precipitate from an acid or an alkaline solution. Any cyanide solution above .8% would not be susceptible of economical use of cyanide in connection with charcoal. Considerable charcoal is required whenever used, 200 pounds charcoal precipitating 10 ounces hullion, which would require considerable extracting capacity. Charcoal has its advantages; little refining of hullion is necessary, no treatment for acid, and little smelting required. When saturated with gold the charcoal can be burned in a special furnace with a down draft into a dust chamber, or, in a large muffle furnace. It is easily made and generally procurable. Experiment and experience can alone determine its relative economy in any individual case.

Mine Signalling by Compressed Air.*

By BERNARD MACDONALD and WM. THOMPSON, Rossland, B. C.

In signalling from the mine workings to the engineer running the hoisting engine on the surface, the system in general use is known as the pull bell system. The mechanical appliances used consist of a marine gong or other sounding apparatus, called the bell, a rope, called the signal rope, a device for deflecting the direction of the signal rope, called the bell crank, and a counterbalance for the weight of the signal rope, called the balance bob. The bell is located in the engineer's room, or within earshot, and generally within convenient sight of the engineer. The signal rope is attached to the bell and carried to the collar of the shaft, thence down it to the deepest workings from which it is desired to transmit signals to the engineer at the surface. The bell crank is a triangular lever, placed at the collar of the shaft, or at any other place, where the direction of the signal rope is changed. The balance bob is placed at the collar of the shaft, or at suitable distances apart in it, to balance or slightly overbalance the weight of the signal rope. It is fulcrumed as a beam, the signal rope being attached to one arm, while the other arm is weighed as mentioned. Balance bobs are sometimes substituted by spiral or coiled springs to produce the same effect. The signals for hoisting or lowering men or material, or telling what is wanted by the workmen below are given by the bell, in the form of strokes and pauses in singles or in any alternating series or combinations conformable with the code used.

The signals are transmitted from any level in the mine by pulling the signal rope, as the signal code requires. The arms of the bell crank, to the ends of which the signal rope is fastened, extend outwards from a fulcrum pivot at right angles to each other. In the case of an incline shaft the arms of the bell crank radiate from the fulcrum pivot at an angle to each other equal to the angle the dip of the incline shaft makes with the horizon. A convenient combination bell crank and balance bob is often made in one piece. The balance bob and the bell crank extend as little as necessary into the shaft, and are boxed in as securely as the conditions will admit, in order to prevent accident in case of pieces becoming loose and falling down the shaft. The signal rope is preferably a wire one, but plaited cotton or hemp rope is of common use. Twisted rope is not suitable on account of the alternate stretching and shortening that would result from the pulls necessary to transmit the signals. The signal rope is kept from sagging or swinging into the shaft by staples or other fastenings driven into the timbers in the corner of the shaft. The balance bobs are so weighted as to overbalance by ten or fifteen pounds the dead weight of the signal rope. Overbalanced thus, unless interfered with by some other causes, the signal rope returns promptly after each pull to its normal position in a state of rest. This device facilitates and makes possible the transmission of signal strokes to the bell at the surface from the workings of the mine.

Separate installations similar to that described are made for each shaft compartment through which hoisting is to be done, and to avoid confusion to the engineer, or mistakes, the gongs or sounding apparatus on the surface have different tones, and are frequently placed at considerable distances apart, and toned in this way the engineer is less likely to mistake from which compartment the signal was transmitted.

When the mine workings are shallow and there is but one or two hoisting compartments, the pull bell system of signalling works very well, but when any considerable depth is attained or where there is more than one hoisting compartment and the traffic is heavy and from various levels, the defects of the system become apparent.

The primary cause of most of the defects is the fact that all the parts of the apparatus are moving parts, having to reciprocate to each other for every pull given by the signal sender. It will be readily understood how an apparatus constructed with a large number of reciprocating parts extending through vertical or inclined shafts to depths of over 1000 or 2000 feet may become deranged and out of order.

One of the greatest defects of the system is that the signal sender cannot know whether the signal he sent to the engineer has been properly transmitted and reported by the bell, as the bell strokes cannot be heard at any considerable depth in the mine. Then, at any time one or more of the numerous parts of the apparatus may become deranged and cease to work during the transmission of a signal, and the part of the signal sent before the derangement occurred may, in itself be a complete signal, conveying to the engineer an entirely different signal from that which was intended. If the erroneous signal thus received be acted upon by the engineer, an accident to life or machinery might result.

Again, the apparatus might become deranged by expansion or contraction of the signal rope. In the case of a wire rope this might result suddenly from the rise or fall of temperature in the shaft due to

change of air currents in the shaft from an upcast to a downcast, or vice versa. In the case of a cotton or hemp rope, the alternate wetting and drying, not uncommon in shafts, would have the same effect. The devices for fastening the balance bobs or for retaining the signal rope in one corner of the shaft are liable to become broken or destroyed by wear or accident, and the rope sag or swing into the shaft, where it would be likely to be caught and carried away by the ascending or descending cages. The numerous defects to the pull bell system of signalling mentioned become more accentuated when the system is operated through an incline shaft.

On account of these defects, a number of electric signalling systems have been devised, from time to time, and tested. While some of these have shown considerable merit, in certain ways, over the pull bell system, nearly all of them demand the use of apparatus too delicate for the rough usage and conditions inseparable from mining operations. These reasons and the lack of simplicity of construction which permits of extension, maintenance and repairs of the apparatus by men lacking technical training constitutes a serious defect in the otherwise best of electric systems.

The defects of the pull bell system became painfully apparent to the writers when they undertook the installation of a signalling system in each of the four hoisting compartments of the Le Roi combination (incline) shaft. If the pull bell or electric systems were installed, the four bells representing the four compartments would have to be in the room with the two hoisting engines. With the possibility of four bells ringing at once, confusion and mistakes would be inevitable. In devising ways to overcome this difficulty, it occurred to us that since the signalling between the conductor and engineer of express trains is now carried on most satisfactorily by compressed air, it would not be more difficult to obtain equally good signal service by the same system through the combination shaft.

With this object in view, correspondence was opened with the Westinghouse Air Brake Co., of Philadelphia, the patentees of the air system used on trains. Being informed that the apparatus of that system was obtainable, and of moderate price, it was purchased and installed in two of the compartments of the combination shaft, in the month of February, 1900. The system was a success from the start, and has been in continuous operation ever since, giving perfect satisfaction without any expense for maintenance or repairs. Recognizing its superiority over the pull bell system described, and believing that its adoption where the circumstances are suitable will add another improvement to mining equipment, the following detailed description of the apparatus and its cost are given.

The apparatus of this signalling system is the same as that used by express trains, with some slight modifications in the installation.

The whistle is the sounding device which conveys to the engineer the signal sent from the mine workings. This is located in the engine room, and where signals from more than one source are received each whistle may be tuned or chimed differently from the other, so the engineer may readily distinguish the source from which the signal is sent.

The signal pipe is $\frac{1}{2}$ or $\frac{3}{4}$ inch in diameter, and must be used exclusively for signalling purposes. It connects with the whistle down to the deepest workings in the mine. Signalling apparatus may be fitted in this pipe at any intermediate points desired. In fitting this pipe care must be taken that no leaks exist, for the smallest leak would destroy the working of the system.

The signal valve must be placed at some point in the signal pipe where there is no danger of freezing—close to the hoisting engine would, perhaps, be most suitable.

The reducing valve is inserted in the feed pipe that connects the compressed air mains of the mine with the main signal pipe of the system.

The discharge valve is inserted in the signal pipe in close proximity to the signalling station so the sibilant sounds of the air discharges may be easily heard by the signal sender. The importance of this lies in the fact that the discharge sounds give assurance that the signal has been delivered to the engineer on the surface. A branch pipe should extend to the main signal pipe and a valve set between the discharge valve and main signal pipe, to permit repairs being made to discharge valve at any time.

A moderately light cord should be attached to the discharge valve at the lever, and extended to within easy reach of the operator.

With each pull of the cord a lever pushes open a valve permitting a small quantity of air to escape from the signal pipe, and causing the signal to be transmitted to the engineer in the manner described.

The apparatus required in the engine room consists of:

One small whistle, cost.....	\$1 25
One reducing valve, cost.....	4 50
One signal valve, cost.....	6 00

Total cost.....\$11 75

The entire cost of installation to a depth of 1000 feet, with signalling stations 100 feet apart, would be \$127.50, made up of details as follows:

Engine room part of apparatus, as above.....	\$11 75
Sufficient $\frac{1}{2}$ -inch pipe to connect from engine room to collar of shaft—say 200 feet.....	5 00
Labor installing (one day, fitter and helper).....	6 50
Eleven discharge valves, located one at collar and one at each working station, cost each \$2.....	22 00
Eleven $\frac{1}{2}$ -inch common globe valves, 75 cents each.....	8 25
One thousand feet of $\frac{1}{2}$ -inch common iron pipe.....	50 00
Fifty wrought iron hangers, 5 cents each.....	2 50
Labor installing (one fitter, two helpers—two days).....	19 00
Ten pounds $\frac{1}{2}$ -inch diameter bell cord, at 75 cents.....	2 50

Total cost of equipment ready for service.....\$127 50

Signals are given the engineer from any station or signalling point in the mine workings by a quick, short pull of the signal cord attached to the lever of the discharge valve. Such pulls momentarily reduce the pressure in the main signal pipe and transmit an impulse on the column of air contained therein, the effect of which is to automatically operate the signal valve and discharge a small quantity of air through the whistle, sounding a sharp, clear blast, corresponding to each pull of the cord. Each whistle blast in the engine room is represented by a sharp discharge of air from the discharge valve, which gives to the signal sender the means of accurately checking the signal sent in.

Signal blasts may be given at the rate of two per second—in fact, this rule should be generally observed, as long discharges of air at the signal valve are not only unnecessary, but likely to confuse the engineer.

In case the supply of compressed air is likely to be shut off at any time, this system might be supplemented with the pull bell, or some of the electric systems of signalling.

In the apparatus for signalling by compressed air there is only one moving part, viz., the lever of discharge valve, whereas in the pull bell system all the parts are of necessity moving parts, being obliged to reciprocate at every pull of the signal rope given by the signal sender. The advantage lies obviously with the apparatus having the least number of moving parts, as every moving part is subject to wear and disorder, which is costly to maintain and repair, and unreliable in operation.

Another very important advantage with the compressed air system is the fact that the signal sender has always the means of knowing whether the signal sent by him has been delivered to the engineer. Changes of temperature, likely to occur from change of air currents, do not effect the working of the system. If any accident should injure the signal pipe or any other of the apparatus of the system, warning would be given at once to the engineer, so the injury could be rectified at once.

In the matter of costs for maintenance, the compressed air system has undoubted advantage of any other system. The system has been established and in operation for about seventeen months at the Le Roi mine, and during this time has required no repairs whatever.

A New Way to Get Levels.

E. Jeyeux, a surveyor at Sevrès, has a new system for obtaining levels, based on two well-known phenomena, the perfect horizontality of the surface of a liquid in repose and the equality of the angles of incidence and reflection of a luminous ray which meets a uniform surface.

The level is composed of a basin C, made of gutta

Illustrating the Jeyeux System.

percha or blackened wood, 20 or 25 centimeters in length by 8 in width, and 4 or 5 millimeters in depth, hollowed as is indicated in the cross section T. This basin is placed on any support about 1½ meters from the ground, and a divided rule R is used on which moves a slide vane with two sights A and B fixed to the ends of a rod which has in the middle a line M. This line should be exactly at an equal distance from the fiducial lines placed on the sights.

The basin having been suitably placed and filled with water to the edge now constitutes a perfectly horizontal mirror, and if the operator directs the basin lengthwise toward the rod with the slide vane, which rod is held vertically, he perceives at one and the same time one-half of the sight B and the image A-1 of the opposite half of the sight A. By raising or lowering the slide vane according as the image appears above or below the sight B the operator

quickly places the vane au point, that is to say, brings the image and the sight B to exactly the same height, so that the fiducial lines appear as the prolongation of each other. By looking with both eyes the surveyor should see both lines clearly superimposed, forming but one straight horizontal line.

In this particular position it is evident that the line M is in the plane of the mirror; that it is exactly on a level with the water in the basin. It is to be observed that when the slide vane is lowered or raised, this latter being au point, there is produced between the fiducial lines of the image A-1 and of the sight B a deviation double the displacement of the slide vane, and, therefore, an error in observing the fiducial lines only produces for the point M an error one-half as great. When the slide vane is a little distant, in order to carefully observe the fiducial lines and to make sure of the superimposition it is well to employ field glasses, the glasses having the advantage also of clearing the edges of the mirror of the light produced by capillary action.

Klein's Combination Classifier.

The Allis-Chalmers Co. of Chicago are introducing to the notice of the mining and milling public a concentrator—the Klein combination classifier—in which compressed air is used as well as water. Of this appliance they claim that it can be used to size or separate materials crushed as coarse as 6 mm.; that it can be used to size anything finer than 6 mm. to the most minute particles; * * * that by the use of compressed air the amount of water required is reduced to less than half of that ordinarily used for hydraulic classification, and that by such elimination of the slimes they can be handled by machinery specially adapted for that purpose.

They state: "This classifier is not in the experimental stage as its practicability has been fully demonstrated at the plant of the Desloge Cons. Lead Co., Desloge, Mo. This is a 600-ton plant and the classifiers have been in use there for two years; prior to the use of the classifiers the lead product in the concentrates averaged 70%, this has now been increased to 75%, due to the efficient sizing of the Klein classifier. The classifiers are also in use for about one year at the following plants: The Granite Bi-Metallic Cons. M. Co., Philipshurg, Mont.; Butte & Boston Co., Butte, Mont.; the Diamond R. Co., Neihart, Mont. The use of this classifier will dispense with the use of a great many sizing trommels formerly required in a concentrating plant and likewise avoid the loss of time and expense incident to the renewal of coverings, etc. Trommels or other sizing screens will only be required for the material coarser than 6 mm. The results obtained from this classifier are without exception the most perfect for sizing and eliminating of slimes ever accomplished in any device of this nature."

From a descriptive pamphlet issued by the Allis-Chalmers Co. the following is taken:

The classifier is made in three different types to suit the size of the material to be handled, as illustrated herewith:

Fig. 1 shows the type used for classifying coarse size of materials, ranging from 6 mm. down to about 2 mm.

Fig. 2 shows the type used for classifying medium size of materials, ranging from about 3 mm. down to about 1 mm.

Fig. 3 shows the type used for classifying the finer size of materials, ranging from about 1 mm. down to the finest slimes.

The principle of the machine is based upon the separation of all slimes and fines from the larger particles and this is accomplished by the constant agitation developed by the introduction of compressed air. The action of the air has a tendency to form small bubbles which continually rise to the surface, carrying with them the slimes and fine material, which are carried off in the overflow with a minimum quantity of water. The air is introduced through one or more pipes from the bottom of the classifier transversely against the column of water introduced through a pipe near the bottom of the classifier.

The classification is accomplished entirely by the compressed air and the water used is only for the purpose of forcing out, or discharging, the sized product through the opening plates directly opposite and in line with the water supply pipe.

In the classifier for coarse materials, shown in Fig. 1, a spray of compressed air is introduced on an inclination against the water supply to cause an agitation which will prevent the possibility of any fines and slimes being carried through the discharge opening with the classified material by the water supply.

In the classifier for material, ranging between 3 mm. and 1 mm., shown in Fig. 2, a mechanical agitator is used to assist in agitation of the pulp in the upper part of the classifier, thereby reducing the quantity of compressed air necessary.

In the classifier for the finest material, shown in Fig. 3, the construction is the same as in Fig. 2, except that the mechanical agitator is omitted.

The water should be introduced under a pressure of not less than 30 feet. The classifier for coarse

FIG. 1.

FIG. 2.

Klein's Combination Classifier.

materials requires about fifty gallons of water per minute. The classifiers for the finer materials require about fifteen gallons of water per minute. The compressed air should be used at about thirty pounds pressure; the classifier for coarse materials requires about 40 cubic feet per minute; the classifiers for finer materials require about 10 cubic feet per minute. The capacity of the classifiers depends a great deal on the character of the ore, but for ordinary work the coarser classifier can handle about seventy-five tons per day of twenty-four hours in each compartment, and the classifiers for finer materials can handle about fifty tons in the same time.

The Tomboy Mine, Smuggler, Colo.*

From a Special Correspondent

The new works of the Tomboy Gold Mines, Ltd., in Savage basin, are worth noting. I send herewith three photos, No. 1 a bird's-eye view of Savage

FIG. 3.

basin, which comprises the holdings of the Tomboy Co., Ltd. In the lower lefthand corner is the new 60-stamp mill which is nearing completion. Next above the mill is the new boarding-house, which is also about completed and is a model structure in itself for the accommodation of the men. Just above the boarding-house is the Columbia mill, the property of the Menona M. & M. Co., which is operated by the Tomboy Co. under bond and lease for a certain term of years. On the extreme left are the new stables, timber shed, machine shop and entrance to Cincinnati tunnel, the lower level of the company's works. The farthest up the basin is the old Tomboy mill and tunnel entrance to the Tomboy mine, which was considered worked out until J. Herron, the present manager, took hold of it; under his management it has produced enough to pay for all their property and netted dividends besides. No. 2 is the company's new boarding-house, which will accommodate over 200 men, for sleeping, in connection with large dining-room to accommodate the same number of men at

* See engravings page 215.

one sitting; kitchen and all necessary storerooms connected. The building is constructed in accordance with sanitary requirements, both lavatories and toilets on each floor, steam heat radiation through the entire building.

No. 3 is the new 60-stamp mill, the banner gold mill of the district; modern in every respect, nothing is lacking in the way of economy for proper treatment of the ores. The machinery was furnished by the Allis-Chalmers Co., of Chicago, and erected under the supervision of J. H. Strite. A No. 5 Gates gyratory crusher, style D, is driven by a 50 H. P. Westinghouse, type C, induction motor. A Robins belt conveyor takes the ore from the crusher and delivers it in bin, back of battery, by means of an automatic tripper which travels the entire length of bin, which is 114 feet in length and has storage capacity of over 800 tons of ore. This ore passes then to suspended Challenge automatic feeders to 5-stamp batteries of 1050 pounds each stamp, which make 100 drops per minute, arranged to run in twelve batteries, driven by three 50 H. P. motors—one for each twenty stamps. After the pulp passes over the copper plates, which are 18 feet in length, with one drop in table, it is discharged onto thirty-six Frue vanners, 6 feet in width. The motors of this mill consist of one 5 H. P. for running Robins conveyor, one 10 H. P. motor for clean-up room, three 10 H. P. motors for vanners, three 50 H. P. motors for batteries, one 50 H. P. motor for crusher, two 125 K. W. self-cooling transformers with oil insulation, for transforming 1000 to 200 volts; switchboard made of panelled marble arranged for two main circuits.

The entire plant is lighted by electricity and heated by steam, a system of pipe coils and low-pressure boiler.

The concentrates are conveyed by trolleys from vanner room to dryer, where they are dried and sacked ready for shipment to smelter.

Smuggler, Colo., Oct. 1.

The History of a Catalogue.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. H. FITCH.

The education of a person is said to begin generations before he is born, and where there is education there is history. My previous article might have been defined as pre-natal, the ideas and conception of what a catalogue should be in order to satisfy the wish of its maker. What a thing aims to be has a bearing on what it is.

To carry out the purposes of a catalogue, personal credit, trade advertisement and information of customers, we must enlist the arts of paper making, illustration and printing, arts of wonderful expansion, which have within the last few years been making history much faster than the books can record it, history which contributes to that of the catalogue. We have some beautiful catalogues published. And why not? We have toiled, we will say, twenty or thirty years to build up a business. We have a large factory and a long payroll. But there are multitudes of people not on our payroll whose respect we desire. Millions have not seen our factory, large and publicly located though it may be. We will show them. We will, in the publication which goes out to the world to represent us, put our best foot forward and spare no expense. The finest of cuts, the most highly glazed paper, whatever ingenuity can devise for elegant ornamentation, we will put in our catalogue. This elegance does not sell goods, nor inform customers, but it is our show. We do not make it to standard size because we want it to be something extraordinary and stand by itself.

With this work of flourish to show patrons and competitors that we are flourishing I will not greatly concern myself. A Kaffir woman was brought from Natal to this country some years since and shown many displays of which we boast. This girl—Noketula Dube—admired the power and value of much that she saw, but with other things, such as the artificialities of dress and the contentions of religion, she was more puzzled than pleased. What her people needed, she said, was "the useful of civilization."

The "useful" in catalogues comes down to what is the cost of a tidy edition of standard size, and what it does for us in bringing trade, and completing the acquaintance of our customers with our goods. In one function, that of a reference list for the convenience of purchasers, the catalogue holds a place which nothing else can fill, but this is an office utility. That appeals to us more is the usefulness of the catalogue in bringing us new customers.

A standard size catalogue is 6"x9" in size of page. The print usually occupies 4 1/2"x7 1/4". The type is usually long primer or small pica. The illustrations are usually from plates, electrotyped from line engravings or halftones and set type high on wood blocks.

Electrotypes are, like stereotypes, made from the mould of an original cut, the surface being formed by electro-deposition instead of casting. The resulting plates are of copper and are practically facsimiles of the original plates, except that there is a slight

thickening of lines and points. The cost of these plates is not estimated by the square inch, but must be gauged by the electrotypers' scale, which is a diagram of squares, each of which bears a price mark. If we set a rectangular block the size of the picture so that its left corner corresponds with that of the scale, the right upper corner is supposed to come in one of these squares, determining the price, subject to discount. It usually falls on the line between two squares, when the electrotypers give himself the benefit of the doubt, just as the grocer takes the odd half cent in change. The scale is for line cuts on wood blocks. Halftones cost 25% more and metal hacks are extra. On the sizes most likely to be used the cost figures out, say, from 1 1/2 to 3 cents per square inch.

For original plates we have wood cuts, line etchings and halftones. The wood cuts vary in cost with the amount of artistic work upon them. On machinery cuts the range is from 40 cents to \$3 or more per square inch.

The etching processes substitute for the skill of the engraver with his tools the corrosive or dissolving action of an acid. The original of the line etching is usually a pen drawing in black on white paper, made larger than the pictures needed and reduced by photography. This reduction makes a smoother line in the picture. A photographic negative is made in gelatin containing dichromate of potash, which is set or fixed by light, while the surface shaded by lines remains soluble, and, being dissolved away, leaves copper or zinc plates exposed to the etching action of an acid, perchloride of iron being used to etch copper. A substance much in evidence in this work is the brilliant red resinous powder known as dragon's blood. The acid will eat a rough, ragged line if care be not taken, and the brushing of the lines with dragon's blood is necessary to protect and preserve them. Etchings of line drawings upon zinc cost about 5 cents per square inch, with a minimum of about 75 cents for a single cut. Halftones upon copper are made by a similar process, but cost about 20 cents a square inch. The halftone process affords the cheapest means of obtaining plates from a photograph, showing a thing about as it looks. For halftone plate work the negative is obtained through a screen of fine cross lines drawn or photographed upon a transparent film. This is necessary to obtain a printing plate of dots or mechanical stipple on which ink will not blur, but will give to every degree of shade its proper measure.

As an illustration of difference in practice, similar cuts ordered at the same time from American and German photo-engravers were furnished by the American firm in copper halftones, while the plates arriving from Germany were in zinc halftones. The former seemed slightly better, both being used side by side in the same catalogue. Another advantage of the copper appeared when a steam fitting blew out in the vault where the cuts were kept, and the resulting steam bath spoiled some of the zinc cuts through corrosion. The screens used are often too fine, so that the plates do not print well on ordinary paper, and, if electrotyped, fill up and make bad duplicates.

Cuts in the text reduce the cost of composition of type, making what the printers call "phat matter." The paper commonly used is a light grade, supercalendered or enameled, the latter for halftone printing. The weight of paper makes a good deal of difference, both in the publishing cost of an edition and the expense of mailing.

The typesetting or composition and the taking down or distribution of the type are figured to the customer at \$1 to \$3 a page, the former being for "phat matter" and the latter tables, which are more expensive than running text.

About 1898 I got a number of estimates on Mergenthaler machine work, but the prices quoted were higher than for hand composition, even on straight running text, and cuts were not handled.

By electrotyping entire pages in thin shells, which are made type high by being clamped to patent blocks for printing, a great saving of composition can be made on reissues and new editions. A pocket edition can be photographed down from say 6"x9" and zinc etched, page for page, at reduced cost, without setting a line of type.

For the run of 6"x9" catalogue work I used to figure \$1.75 per printed page for composition, and 30 cents per 1000 pages run for paper and printing in one color. For two-color work I figured 60 cents, and electroplates per page were 40 cents. Prices have lately changed through combination, and have stiffened somewhat, except halftone work, which is rather lower on account of competition, reduced cost and extensive use. Electrotyping is now higher, also zinc etching. Still, I think prices are fair, and that combination is beneficial. There was a time when zinc etchings were so cheap that they were not decently done, and persons buying of the lowest bidder got shallow cuts and "print-ups" for their economy.

All these remarks apply to publication on a close, economical basis, of those who, though "on fine art bent," have yet "a frugal mind." My advice is not to be too frugal. If the catalogue is what it ought to be, the ripe fruit of the manufacturing "plant," well considered in purpose and detail, the cost of preparation should so far outweigh cost of publica-

tion that we can afford a little extravagance in the latter. If the catalogue is built upon the lines of a cheap idea it may be cheaply published, but a valuable idea deserves to be well dressed.

Some further particulars of costs with their relation to advertising results will be given in another article.

(TO BE CONTINUED.)

Velocity and Discharge of Water Through Submerged Orifices.

The following table shows the theoretical spouting velocity of water in feet per second, and number of cubic feet discharged per minute, through an orifice of 1 inch area, under different heads, from 1 to 40 feet:

Head in Feet.	Velocity per Second in Feet.	Cu. Ft. per Min., Area of Orifice, 1 In.	Head in Feet.	Velocity per Second in Feet.	Cu. Ft. per Min., Area of Orifice, 1 In.
1	8.02	3.34	21	36.75	15.31
2	11.34	4.73	22	37.62	15.66
3	13.89	5.78	23	38.46	16.02
4	16.04	6.68	24	39.29	16.36
5	17.93	7.47	25	40.10	16.71
6	19.64	8.18	26	40.89	17.04
7	21.22	8.84	27	41.67	17.36
8	22.68	9.45	28	42.43	17.68
9	24.06	10.02	29	43.19	17.98
10	25.36	10.57	30	43.93	18.30
11	26.60	11.08	31	44.65	18.60
12	27.78	11.57	32	45.37	18.90
13	28.91	12.05	33	46.07	19.20
14	30.00	12.49	34	46.76	19.48
15	31.06	12.94	35	47.45	19.76
16	32.08	13.36	36	48.12	20.05
17	33.06	13.77	37	48.78	20.23
18	34.02	14.18	38	49.44	20.60
19	34.96	14.57	39	50.08	20.87
20	35.87	14.94	40	50.72	21.12

Calculated from Francis' Formulas.

The above table represents the theoretic velocity and discharge due to an orifice conformed in all respects to the shape of the contracted vein. In ordinary practice, through orifices having parallel sides the actual velocity and discharge will be but about 64% of the table. Bearing this fact in mind, the above table may be used with reasonable accuracy in measuring the discharge of water through ordinary gate openings into overshot and breast wheels, through waste gates, and other apertures cut in planks.

EXAMPLE.—Suppose the opening through which the water passes onto an overshot wheel to be 72 inches long, and the gate to be hoisted 2 inches, what amount of water will it discharge per minute with 3 feet head of water in the forebay above the opening?

SOLUTION.—72 × 2 inches equals 144 square inches × 5.78 (the discharge stated in table for an orifice of 1 inch area under 3 feet head) equal 832 cubic feet theoretic discharge per minute, 64% of which equals 532 cubic feet actual discharge per minute.

There are many instances in powers already improved where the quantity of water in a stream can be ascertained by using the above table, without resorting to measurement by weir.

In ascertaining the head of water under which an orifice is discharging, measure from the surface of the water to the center of the orifice.

Recent Coal Labor Statistics.

The volume of mineral resources of the United States for the calendar year 1901, now in press, U. S. Geological Survey, presents some interesting statistics of the labor in the coal mines of the country.

From 1898 to 1901, inclusive, the statistics of coal production were as follows: In 1898 the average number of men employed was 401,221, and they averaged 190 working days during the year, producing 219,974,667 short tons of coal, valued at \$208,000,850; in 1899, 410,365 men, working 214 days, produced 253,739,992 short tons, valued at \$256,077,434; in 1900, 448,581 men, working 212 days, produced 269,682,827 short tons, valued at \$306,671,364; in 1901, 485,544 men, working 216 days, produced 293,298,516 short tons, valued at \$348,910,469. In 1898 the average price of coal per ton was 95 cents; in 1899 it was \$1.01; in 1900 it was \$1.14; in 1901 it was \$1.19.

According to the two great divisions of the coal industry—the bituminous and the anthracite—the statistics are as follows: In the bituminous coal industry in 1890 192,204 men, working 226 days, produced 111,302,322 short tons, valued at \$110,420,801, an average of 2.56 tons per man per day and of 579 tons per man per year; in 1895, 239,962 men, working 194 days, produced 135,118,193 short tons, valued at \$115,779,771, an average of 2.90 tons per man per day and of 563 tons per man per year; in 1900, 304,375 men, in 234 days, produced 212,314,912 short tons, valued at \$220,913,513, or 2.98 tons per man per day and 697 tons per year; in 1901, 340,235 men, working 225 days, produced 225,826,849 short tons, valued at \$236,406,449, or 2.94 tons per man per day and 664

tons per year. The average price of bituminous coal per short ton in 1890 was 99 cents; in 1895, 86 cents; in 1900, \$1.04; in 1901, \$1.05.

In the anthracite mines in 1890 the number of miners was 126,000, who in 200 days produced 46,468,641 short tons, valued at \$66,383,772, the average production being 1.85 tons per man per day and 369 tons per man per year; in 1895, 142,917 men produced in 196 days 57,999,337 short tons, valued at \$82,019,272, an average of 2.07 short tons per man per day and of 406 tons per man per year; in 1900, 144,206 men working 166 days produced 57,367,915 short tons, valued at \$85,757,851, or 2.40 short tons per man per day and 398 tons per man per year; in 1901, 145,309 men worked 196 days and produced 67,471,667 short tons, valued at \$112,504,020, an average production of 2.36 short tons per man per day and of 464 tons per man per year. The average price per short ton of anthracite coal in 1890 was \$1.43; in 1895 it was \$1.41; in 1900 it was \$1.49, and in 1901 it was \$1.67.

In the last twelve years the number of workers in the anthracite mines has increased from 126,000 in 1890 to 145,309 in 1901, or over 15%. During the same period the number of men in the bituminous mines has increased from 192,204 to 340,235, or a little over 77%.

The statistics of accidents in the mines in the calendar year 1901, already published in part, show that 1467 men were killed, 3643 men were injured, and that 188,668 tons of coal were mined for each life lost. In the bituminous mines of the country 954 men were killed and 2400 were injured, in a total of 340,235 men at work; in the anthracite mines 513 men were killed and 1234 were injured in a total of 145,309 at work.

The statistics for Pennsylvania alone show 301 men killed, 656 men injured, and an average of 273,288 short tons of coal mined for each life lost in the bituminous mines; and 513 men killed, 1243 men injured, and an average of 131,524 short tons of coal mined for each life lost in the anthracite mines. It is interesting to note that in Pennsylvania the number of short tons of bituminous coal mined per life lost was a little more than double the number of short tons of coal mined per life lost in the anthracite mines.

Notes on the Treatment of Zinc-Precipitate Obtained in Cyaniding New Zealand Ore.*

By HAMILTON WINGATE, B.Sc., Auckland, N. Z.

In view of the fact that the fineness of the resultant bullion varies with the particular treatment to which the zinc-precipitate is subjected, and since there are considerable losses attributed to both methods, the following notes on the results obtained at the Waite-kauri Extended mine, Maratoto, N. Z., may be of interest.

The ordinary method of roasting the vacuum-dried precipitate was adopted instead of the treatment with sulphuric acid, the necessary facilities for the latter method not being available. Moreover, provided the ordinary method is carried out with the necessary care, it is questionable if it is not the most satisfactory where large quantities of precipitate have to be banded, and where (as is generally the case in this district) a considerable amount of silver is present.

All the precipitate was first washed through a 40-mesh sieve. If it was necessary to recover the bullion at once from the accumulated short zinc, it was oxidized and melted separately; but, as a general rule, being heavily charged with bullion, it was placed on the bottom of the trays at the top end of the extractor boxes, where it acted as an excellent precipitant, the bullion being recovered at the next clean-up.

After drying on a filter with the aid of a vacuum pump, the precipitate was weighed, and removed to the oxidizing furnace, which is similar to that generally in use in New Zealand, consisting essentially of an ordinary square tray of cast iron, with 6-inch sides, built over a brick furnace. Wood is used as fuel. The tray is banded over with sheet iron, fitted with a sliding door, and the fumes pass through a flue at the top into a dust chamber, then into the open air.

OXIDATION OF THE PRECIPITATE.—The oxidation was conducted first at a low temperature, which is gradually raised, until finally the iron tray is a very dull red heat, the precipitate being broken up with a suitable rake, and great care being exercised to avoid loss by dusting, especially as the last stage is reached. After cooling, the precipitate was carefully weighed, the time occupied in oxidizing being from two to four hours.

MELTING OF THE OXIDIZED PRECIPITATE.—The oxidized precipitate was fluxed as follows: 100 parts of oxidized precipitate; 50 parts of anhydrous borax; 15 parts of anhydrous sodic carbonate; and, after mixing, carefully charged into a No. 50 plumbago crucible, and melted at a moderate heat, the pot being kept carefully covered during fusion, and recharged in each case before fusion was complete. When three-quarters full, the temperature was raised, the slag, now thoroughly liquid, was ladled off

into molds, and the crucible recharged as before, until about two-thirds full of molten bullion.

The bullion was now poured into molds, each bar being again melted in a crucible of smaller size, and skimmed, if necessary, before pouring. After washing, the bars were then sampled and weighed.

The following table gives the particulars of eight consecutive clean-ups and the fineness of bullion obtained:

Fineness of Bullion	Sil. Cont. in Bullion.	Fine Gold Contained in Bullion.	Total Weight of Bullion Obtained.	Per Cent Yield of Bullion from Oxidized Precipitate.	Weight of Oxidized Precipitate.	Weight of Vacuum Dried Precipitate.	No. of Melt.
909.0	343.94	115.86	565.8	81.9	56	112	1
914.5	181.46	57.44	261.1	53.0	33.75	65	2
936.1	433.23	110.37	581.75	72.2	55	95	3
956.5	461.28	130.75	622.05	56.7	76.5	130	4
964.2	304.12	84.82	403.35	52.1	53	88	5
961.0	417.82	129.23	569.25	45.1	86.5	150	6
943.5	278.77	92.84	393.85	58.8	43.5	71	7
935.9	263.35	85.29	373.55	41.3	62	122	8
							Total.
			3710.70	54.8	466.25	833	

NOTE.—In the case of Nos. 1, 3, 5 and 7 only the top partitions of the extractor boxes, containing the most of the precipitate, were cleaned out, whilst in the case of Nos. 2, 4, 6 and 8 a complete clean-up of the extractor boxes was made. The bullion was recovered from ore all of which had been wet-crushed.

The fineness of the bullion obtained was mainly due to the passing of the precipitate through the 40-mesh sieve, thus eliminating the "short zinc." It is impossible to oxidize such zinc, scattered throughout a mass of bulky precipitate. Its presence causes both mechanical losses and losses through volatilization, and it is most important that it be either eliminated or oxidized, if subsequent losses in melting are to be avoided.

SAMPLING OF THE BARS.—The bars so obtained were of very uniform composition, and the drillings from a hole right through the bar gave very accurately its actual value. The base metals present were zinc, together with lead, iron and copper in small quantities, the latter being derived most probably from the fulminate caps used in the mine, as no trace could be detected of its presence in the ore.

SLAGS, ETC.—These were crushed in the mill, giving a return equal to 1½% of the total bullion recovered, the tailings, as bagged for shipment to the smelter, being worth, according to careful sampling, £25 per ton. The sweepings from the dust chamber and flue resulted in the recovery of bullion of a total value of £9 after the oxidizing of some £6000 worth of precipitate, showing the loss from this source to have been small.

MEN should use the technical papers intelligently. It is a good plan for the head of any department to mark articles and send them to associates and employees for comment and suggestion. If a young engineer or miner or metallurgist is so situated that he can contribute to the technical press as a writer, it will be of distinct advantage to him to do so. He acquires the ability to express himself well; he learns to think straight (or he is quickly found out); he will become known to his future associates. The discussion which may arise on the subject will be at comparatively short range; an experienced writer is given a better chance to consider any reply to questions and criticism than is offered in oral debate at a society meeting; moreover, the men who take part in such discussions do so because they are interested in the subject. And the pecuniary reward is not to be despised. As a preparation for his future work, a young engineer can not do better than to become a close reader of the current periodicals which have for their field his chosen profession. Let him follow the discussions and, if possible, take part in them; in order to do this with credit to himself, he must become familiar with the subject, and, having once mastered it, will easily recognize it when after eight or ten years the same subject may appear again, thinly disguised and heralded as something that is really new. Many matters have a way of reappearing at more or less regular intervals, so that the elders of the profession have met most of them more than once.

Mining and Metallurgical Patents.

Patents Issued October 7, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ROTARY DRILLING MACHINE.—No. 710,438; F. H. Davis and C. A. Terry, New York, N. Y., assignors to Davis Calyx Drill Co., New York, N. Y.

In core-drilling machine, combination with stationary supporting member and drive shaft whose bearings are stationary therewith, of member vertically swiveled upon stationary member, revolvable drill rod, mounted in bearings upon swiveled member, intermediate shaft, gearing between intermediate shaft and drill rod and between intermediate shaft and drive shaft, and through which gearing drill shaft is adapted to be rotated, secondary shaft, worm-wheel on intermediate shaft, worm on secondary shaft, gears adapted to intermesh between drive shaft and secondary shaft, together with means whereby intermediate shaft may be actuated by drive shaft to rotate drill rod, either directly through aforesaid gearing between it and drive shaft, or through worm-gearing, and gearing between it and drive shaft.

SETTLING TANK.—No. 710,462; R. D. Jackson, Reno, Nev.

In settling tank, distributor having downwardly extending discharge outlets for pulp and liquid, means for supplying material to distributor, means for rotating distributor, means for raising distributor while rotating whereby distributor rises steadily above accumulating deposit.

ROCK DRILL, ROCK DRILLING MACHINE BIT.—No. 710,484; D. Mackenzie, Randfontein, South Africa.

Combination of holder formed with grooves or recesses across end thereof made angular for portion of their entire length to receive removable cutters, having shoulders against which inner ends of cutters abut, holder being also split for portion of its length

*New Haven Meeting, Am. Inst. Min. Eng.

in two directions into jaws which normally grip cutters, but may be expanded, and detachable angular cutters adapted to fit grooves provided with several separate cutting edges so constructed and arranged in holder as to be capable of being removed and replaced to reverse each cutting edge.

CLOSURE FOR RETORTS.—No. 710,476; J. M. K. Letson and F. W. Burpee, Vancouver, B. C.

In retort, slotted and internally grooved head having upper seat, door adapted to be seated in groove, cap piece for closing head slot, pins journaled in cap piece having eccentric ends, operating handles, hooks loose on eccentric ends taking beneath lugs when handles are turned in one direction, projections on handles for throwing off hooks when handles are turned in opposite direction and eccentrics are released.

PROCESS OF TREATING ORES.—No. 710,496; S. T. Muffly, Bowdre, Ga.

Saturating ores with chemical solvent, revolving ores and solvent, agitating and breaking up ores, injecting current of heated air under pressure charged with fresh solvent in the form of spray at one point to ore charge, circulating spray through ore charge axially of its revolution and agitation, carrying off liberated elements and fumes at point opposite to injection of spray.

MACHINE FOR SEPARATING GOLD.—No. 710,738; W. J. Barron, Brooklyn, N. Y.

Gold washing machine comprising in combination hopper 14 having inclined grid 15, inclined pan 16 beneath hopper having longitudinal screen 17 supported by ledges 19 in pan, cross-plate 20 at head of pan, riffles 21 in pan below screen, hood 26 at tail of

pan, reverse inclined pan 35 having screen 36 extending into hood having amalgamating plates 40 beneath screen.

METHOD OF FORMING LINING OF CONVERTERS OR FURNACES.—No. 710,588; W. J. Knox, Edgewood Park, Pa.

Process of lining vessels for metallurgical work, which consists in forming dry mixture of pulverized magnesite and oxysulphide of iron, adding thereto soluble glass, forming mass into plastic condition by addition of water, applying mass thus formed to surface to be lined, drying same, then applying thereto solution of calcic chloride, thereby forming calcic silicate throughout mass.

GOLD SEPARATOR.—No. 710,690; W. W. M. Hickey, San Francisco, Cal.

The combination in gold separator of inclined suspended end-shaking sluices having perforated inclosed bottom respectively, inverted riffles extending across lower sluice out of contact with bottom, hopper with perforated oscillating bottom located above upper sluice, pumping mechanism, means whereby actuated in unison with oscillations of sluices, plurality of amalgamated rollers journaled turnable with lower portions submerged in water tanks, chutes for delivering material upon tops of rollers, endless traveling belts submerged in tanks receiving material as it falls from rollers, belts discharging material from each tank successively, tank having vertically journaled shaft and stirring arms into which material is delivered, and an inclosure exterior to which water is separated from sand, and a pipe by which clean water is returned to pumping apparatus.

TURNTABLE FOR USE IN MINES.—No. 710,851; W. L. Eppers and J. Hamilton, Mount Washington, Md.

Combination, with inclined mine shaft and lateral level communicating therewith and having tracks of

like gauge, of table which is pivoted and adapted to rotate in vertical and horizontal planes provided with track section of same gauge as fixed tracks, worm gearing, two worm shafts for operating same, to rotate table as required to shift it in both planes, shafts being provided with cranks arranged in juxtaposition, and spring pin for locking table and lever connected with pin and extending into juxtaposition with cranks of worm shafts.

APPARATUS FOR EXPOSING BEDS OF WATERCOURSES AND CONVEYING MATERIAL THEREFROM.—No. 710,813; J. W. Stanearth, San Francisco, Cal.

In means for exposing river beds and conveying material therefrom, combination of dam across river, flume extending along and above bed of river discharging into river bed at lower point in its course, flume being of sufficient dimensions to take whole normal flow of river, conveyor for carrying away tailings extending upward in bed of river, and means operated by passage of water in flume for actuating conveyor.

ACTUATING MECHANISM FOR JIGS FOR WASHING MINERALS OR ORES.—No. 710,777; C. J. Hodge, Houghton, Mich.

Combination of frame, continuous shaft rigidly mounted in frame, means for driving shaft, two rigid trunnions adjustably secured to frame near ends of shaft having elongated passages through which shaft passes, eccentric journaled on each trunnion having crank-arm, flywheel fixed to shaft between crank-arms having radial diametrically opposite slots or ways, studs connected to crank-arms sliding in ways and eccentric rods actuated by eccentrics.

QUICKSILVER FURNACE.—No. 710,897; R. Scott, San Jose, Cal.

In combination with tile for quicksilver furnaces or the like, a well, bracket formed of single piece with inner leg adapted to be set in wall of furnace, outer leg formed with apex for supporting tile, preventing its displacement.

FUSE-IGNITING TAPE.—No. 709,979; J. H. Carson, Denver, Colo.

A fuse-igniting tape formed from strip of material coated on its inner surface with an inflammable or explosive substance, its exterior surface with substance adapted to prevent injury from moisture.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Correspondence).—Since the ditch line of the Miocene Ditch Co. is completed an entire change has come over Dexter creek. Every claim is working to its fullest capacity and the result is very satisfactory. Snow gulch claims Nos. 1 and 2 are being hydraulicked and the tailings from former years are being worked over. The Utica claim on Glacier creek, owned by Chas. D. Lane, is working a crew of thirty men day and night. The Hot Air bench continues to take out big clean-ups—\$4000 to \$5000 every twenty-four hours. Rock creek, tributary to Snake, has developed quite a few good claims. No. 2 below on Anvil creek has closed down operations for the season. Next season a hydraulic giant will work on the tailings and the banks. The benches of Anvil are proving to be as rich as the creek itself; however, work is not being rushed on them in anticipation of hydraulic plants next season. The foothills of Anvil, Saturday and Coopers' gulch have developed several deep mines, some 60 and 70 feet deep, with pay at bedrock of 5 to 10 feet. Peeluk creek No. 3 is being worked by the present owners, Mathews & Clum, who bought the claims Nos. 3 and 4 for \$40,000 from Dugan & Bell. They have a crew of thirty men employed day and night, and some clean-ups go as high as \$2500 per twenty-four hours' run. The gold is fine, and it is believed the beach has deposited the gold on the high ground. However, No. 5 on Peeluk creek is developing into a good mine also. The gold is much coarser and undoubtedly comes down from the mountains. Otter creek and its tributaries, Fox creek, Franklin gulch and also the benches, are good properties and are being opened up with good results. Nome river will have two new ditches. One will be built from the headwaters of the Nome river and will be 6 feet at the bottom, 10 feet on top and 6 feet deep. The preliminary work has all been done and work will be commenced early next spring. Kelly & Co. have brought in on the Ohio 200 tons of machinery for their pumping plant, which will be installed this year at the mouth of Dexter on Nome river and will pump water into a reservoir on the Dexter hill from which it will be conveyed to Dry, Dexter and Anvil creeks.

Solomon river has a boom of its own. Benches of Solomon are good from Big Hurrah to about 3 miles below Snowell creek. Big Hurrah is working six claims—several big nuggets, one \$140 and the other \$80, having been found on No. 4. Snowell creek benches are proving to be of good value. Mrs. E. McNaught, who owns the Ophir Bow, has discovered a good paystreak at the upper end of her claim while the assessment work has been performed. Mystery creek has contributed at least \$50,000 to the season's output. Also, the benches are being prospected now. Quite a stampede was in progress this summer to Jackson creek and the west fork of Jackson creek across the divide from Mystery, where very good prospects have been found, while some assessment work was being done. Beaver creek, tributary to the El Dorado river, has opened up a few paying claims.

Ophir creek, in the Council river district, has been worked from its head to its influx with the Neukluk and good results have been obtained. C. D. Lane, who owns considerable property there, has developed that section wonderfully. A railroad goes from Council to No. 15 above. A ditch has been built from the head of Ophir to No. 15 and will be continued down to the mouth of the creek.

Candle creek, it is claimed, produced this season \$100,000, in spite of the unfavorable reports that have arrived all summer from that section. The Inmacubuk river, a tributary to the Good Hope bay, has several good claims; the country up in the Arctic district, however, is so waste and so very few men have given it any attention, that it will take several years before it is thoroughly developed. The Koregrock section has had a bad reputation all summer and very little work has been done in that section of the country. Several tin ledges are claimed to have been discovered above Teller in the direction of Potato mountain, but no further news has been heard from it. The Sinrock river has also proven to be very valuable in its vast deposits of auriferous gravels on what is known as Irish hill, on Green gulch, a tributary to Sinrock, where good mines are being developed by Mrs. E. McNaught.

The season is drawing to a close. The nights are commencing to be frosty, and in some parts the mining operations have

ceased for the season. Winter work will commence soon, especially in the neighborhood of Nome, on Peeluk, Otter creek, Newton gulch, Bourbon and Dry creeks, Wonder benches and in the old mines of Dexter and Anvil creeks.

The season has been very satisfactory and next year we hope to go one better.

No discoveries have been made of any placer diggings in Siberia by the Siberian D. Co. and its 200 men up to date. Some quartz has been found but no startling values discovered.

Nome, Oct. 1.

ARIZONA.

COCHISE COUNTY.

Superintendent Quinn, of the Grand Reef mine, with R. V. Day, general manager mining interests of the estate of J. W. Mackay, is at the property of the estate, 60 miles north of Willcox. A smelter will be erected.

W. F. Staunton says the four boilers at Tombstone, the largest in the Territory, are in operation, the steel gallow-frame placed, and the pumps and heavy machinery all lowered into the mine successfully. The pumps will be running Nov. 1. The new buildings are all completed and in use by the company and its employees. The dead work is accomplished and new development will begin. Men are cleaning out the old workings on the 600-foot level and connecting them with the new shaft. When the pumps begin running, sinking in the big shaft will follow. The shaft will be put to the 700-foot level.

J. Blair has charge of a force on the property of the Arizona Development Co., near the property of the Copper Glance. The Peabody mine, near Cochise, which was shut down on account of the low price of copper, has resumed. Ore is being shipped from Cochise station.

The mines at Gleason, Ingram and Pearce have resumed.

At Bisbee, where they have excavated for the new jail, they have run onto numerous kidneys of high-grade copper glance and peacock ore. The Review says that hereafter when a bad man digs out of jail he will be earning good wages while he is digging.

GRAHAM COUNTY.

The Shannon Copper Co., Clifton, has foundations for a 500-ton concentrator. The original intention of the company was a 250-ton mill, but recent developments at the mine justify a larger plant. It is expected to have the first 250-ton section in operation in January.

The London Statist claims to have information that the Arizona Copper Co. is now producing copper at 6.7 cents per pound, including electrolytic, refining and marketing charges.

MARICOPA COUNTY.

At the Electra mine, between Wade's and Gilbert, the shaft is down 200 feet; the ledge has widened over 5 feet, the entire shaft being in ore.

In the Leviathan G. M. Co., which owns and is operating the Maximilian group of claims 16 miles north of Wickenburg, the main shaft is down 300 feet.

The Oro Grande will start the erection of their mill within a short time.

In the San Domingo district, the Maricopa G. Co. has put in three dry concentrators, of 4, 6 and 9 H. P., run by gasoline engine.

A. H. Gamage has returned to Wickenburg and will work the Denver group at Gilbert.

J. M. Swetman has bought the Norman, Great Scott and Scott No. 2 mines and the Wainwright mill site for \$10,000. The property is located 45 miles north of Phoenix.

MOHAVE COUNTY.

A double compartment shaft will be sunk on the Mother Lode, owned by the Philadelphia & Arizona Co.

At Chloride is received a carload of iron ore from Cerrillos, N. M., for the smelter. At the Gold Nugget, Cerbat, Superintendent Barry has men getting ready for extensive work.

At the 500 level of the Minnesota a station has been cut and drifting is under way.

PINAL COUNTY.

Near Florence, work is resumed this week in tunnel No. 1 on the Henry-Ritsch property.

T. J. Seybolt has bonded a group of claims on Queen creek, above the old town of Pinal. The old Gem mine is the leading claim of the group. He will put in air compressors and use machine drills in developing the property.

Supt. F. D. Adams says that the Bob Tail Mines Co. has been reorganized, and the name changed to the Gila-Pinal Mines Co. They will put in extensive machinery at the gold mine on Mineral creek, and at the copper mine in the Pinal mountains, in Gila county, and actively develop and operate both properties.

A. G. Sandberg has given Phelps, Dodge & Co. a working bond on the Ariz-

zona copper group, 30 miles south of Casa Grande. The bondees have men at work on the group and are uncovering ore bodies.

SANTA CRUZ COUNTY.

M. Lulley, a prospector, has found a "lost mine," the "Wandering Jew," at Tumacacori, 6 miles north from Calabasas, 4 miles south from Tubac.

The Pride of the West M. & M. Co., at Washington, is again in operation. Jesse Scooby is general manager.

The Pride of the West M. Co. of Washington paid a dividend of 10 cents per share, \$15,000, August 15.

YAVAPAI COUNTY.

G. W. Hull says Jerome is still very quiet. The fire in the mine is still burning and it will be two months or more before it can be gotten under control. The company, however, is still pushing work in putting in the new smelters, and have 100 men at work in clearing away the debris caused by the floods some weeks since.

A. J. Pickrell of the G. & C. Con. M. & M. Co., President group, is putting up a cyanide plant, to be ready to start up Dec. 1, when fifty tons of ore a day will be treated. The company employs thirty men.

W. D. Powell is putting up machinery on the Black Rock mining claims, Cherry Creek district, and says that he has a body of copper ore in a new shaft sunk in the Ontario. The old shaft followed a ledge in which a large body of rich ore was struck.

The fire in the McCabe mine is extinguished.

YUMA COUNTY.

The Sentinel says that the new Arizona Smelting & Reduction Co., J. Rice president, F. N. Rust secretary, propose building a smelter in the vicinity of Yuma.

Globe reports that at a meeting of Globe merchants action was taken withdrawing patronage of business firms and individuals from the organ of the Globe Miners' Union, the first step in a movement in which the copper companies are included to break the Miners' Union and make Globe a non-union town.

CALIFORNIA.

ALPINE COUNTY.

The Alpine Placer G. M. Co. is organized; E. R. Dodge of Reno, Nev., is secretary.

AMADOR COUNTY.

The Zeila mine will adopt oil for fuel purposes.

A long tunnel has been driven to the Horn boundary line, and connection made with the shaft. The ore body is 7 feet wide, and prospects taken of the rock and decomposed matter indicate a value of \$100 per ton.

A two-stage air compressor has been installed at the Central Eureka mine. A 50 H. P. dynamo supplies power.

The South Eureka mill is closed. At a depth of 2000 feet new levels are being opened up. Development work only will be continued for the present.

BUTTE COUNTY.

Work has been suspended at the Burroughs & Co. mine, McCabe creek.

CALAVERAS COUNTY.

Two carloads of concentrates are being shipped weekly by the Melones Co. from the 60-stamp mill to the Selby smelter.

The Oriole shaft is down 600 feet. Grading for the 10-stamp mill is completed.

The Gwin M. Co. will haul its lumber ordered at Valley Spring with a steam wagon.

INYO COUNTY.

The Inyo Gold Co., owning the Tuber mine at Ballarat, will build a 50-ton cyanide plant on the mill tailings at the Tuber.

KERN COUNTY.

The Red Rock Gravel M. Co. is incorporated; C. E. Van Meter, W. D. Barney, G. W. Lloyd, W. A. McGinn, of Randsburg, and C. Lloyd, of Santa Barbara; principal office at Randsburg.

Five miles from Havilah, the U. S. G. M. & M. Co. has three claims, a millsite with water and timber. The ore runs \$15. Northwestly 10 miles is the Mendara mine with a 15-stamp mill, also the property of the U. S. G. M. & M. Co.

The Randsburg Miners' Union demanded an increase in the wages of the car men at the Yellow Aster. Thereupon the Yellow Aster mine and mill were closed down, and 230 men are out of employment.

MARIPOSA COUNTY.

(Special Correspondence).—Development work on the Hayseed mine, Whitlock district, has reached the 300 level. Drifting is going on north and south on the vein, which is about 3 feet thick and of good quality. A new steam-hoisting plant gallow-frame, introduction of oil in

place of wood, etc., are changes in contemplation.

Fifty tons ore belonging to J. Teats were run through at the Ellingham mill last week. The ore is reported to have gone \$20 per ton. The mill is now running on a 50-ton run from Teats mine. They are taking out ten stamps from the old Whitlock mill.

Ten men are at Hite's Cove busy working.

Whitlock, Oct. 14.

Capt. A. H. Ward has about twelve men working on the Penon Blanco.

MADERA COUNTY.

Near Grub Gulch at the Mt. Raymond mine, P. Clark, of Spokane, is expected to start up work. It is a lead property, with 1½ mile of tramway from the mine to the reduction plant on Raynor creek. The mill cost \$50,000, and is run by water power. It is the intention to put in an electric plant for light and power.

MONTEREY COUNTY.

A bed of mica has been discovered in Monterey county by Walther & Jones, of San Jose, 6 miles east of Soledad.

NEVADA COUNTY.

The Winfield Scott or New Hartery mine is banded to Eastern men. It adjoins the Allison Ranch and the old Hartery mines. The bond is for six months and is for \$25,000.

The Idaho D. Co. has incorporated at Grass Valley; directors, J. H. Neff, J. Sonntag, J. E. Carter, R. Neall, C. E. Clinch, P. W. Michell, J. M. Thomas.

The Gold Blossom mine, recently reported sold, is bonded to California men who will put up a hoisting works, pumping plant and 8-drill compressor. A new double-compartment shaft will be sunk on the pitch of the ledge. It is the intention to sink 300 feet before starting to drift. Geo. Dyer has charge.

At the Posey mine Superintendent Bray has the shaft down 360 feet in ore; sinking will be continued to 500 feet.

The Old Blue lead, connecting Quaker Hill and Canada Hill, will be opened and developed.

PLACER COUNTY.

J. Manson is developing the Calf Pasture mine near Auburn.—At the Old Crater mine at Ophir active operations are to resume there in a short time.—The Boulder mine is unwatering the old works.

PLUMAS COUNTY.

Because of representations made by State Mineralogist Aubrey, Commissioner Hermann of the General Land Office at Washington has decided to hold up all entries of public lands in the Susanville district, pending an investigation. Recently the Sacramento Valley Development Association and the State Mineralogist memorialized President Roosevelt relative to the actions of timber land grabbers in the mountain counties, who are getting possession of timber lands on mineral entries and mineral lands on timber claims. There are three ways in which these mineral lands, including claims upon which assessment work has been performed, are being seized—by location as timber claims, by the use of forest reserve scrip and by illegal placer locations. The Federal Government is preparing to prosecute 100 dummy locators, who are alleged to have been identified with frauds in land matters. The Government has placed J. N. High, a special agent, in the field in the Susanville district to investigate.

SAN BERNARDINO COUNTY.

The John R. Gentry mines at Ludlow have been acquired by L. E. Porter, superintendent Bagdad mines, and B. E. Chase of Syracuse, N. Y. These mines adjoin the Bagdad property. It is the intention to do development work. Later on a stamp mill will be erected. They will be connected with the Ludlow branch of the Santa Fe, now building.

Twenty-eight engineers and assistants of the U. S. Geological Survey will rendezvous at The Needles between Oct. 15 and 20 to begin active work toward fulfilling the provisions of the National Irrigation Act in the thirty-two townships reserved along the Colorado river between The Needles and Yuma on the California side.

SHASTA COUNTY.

The first report of the Trinity Copper Co. to its stockholders says:

"The original property of the Trinity Copper Co. comprised 640 acres of mineral land; since then the company has acquired about 3655 acres of land, about 1700 of which is mineral land and the rest smelter and townsite.

"The only outside work has been done on our Statesman group, in which we have a good deposit of ore, and if it continues it will be unnecessary to furnish any flux for the smelter, although we have at the present time the Uncle Sam

group of mines under bond and lease, to determine their exact value, for the purpose of using the same for flanking ore.

"Since the company has been in operation, it has built thirty buildings, comprising an office building, including sleeping accommodations for manager and staff, assay building fully equipped, hospital, storehouse, miners' dwellings, and all accessories at the mine, including an equipped fire department.

"Under the direction and advice of our former mining manager, it was the intention of the company to erect with all possible speed a complete smelting plant of sufficient capacity to take care of the ore bodies then in sight. To this end plans were submitted to the directors and estimates asked for. At this stage the directors opened negotiations for a property in full operation, which, if acquired, would necessitate a radical change in contemplated plans. Owing to the unsettlement of metal market conditions these consolidation or purchase plans have not yet been consummated.

"Including our main working tunnel of 1145 feet, the work done on our property in opening up our ore bodies, including drifts, tunnels, etc., amounts to 7230 feet, or nearly 1 1/2 mile of underground workings. In addition, the number of feet of work done by our diamond drill was 5119 feet.

"From a report just received from Manager Brown the tonnage actually in sight and blocked out, ready for smelter, is 500,000 tons. This does not include the large quantity of ore that has been taken out of the mine, stored in our working tunnel, on our dumps, etc., nor the still larger quantity generally spoken of as in sight, but which is not blocked out ready for smelter.

"Our general manager has submitted his calculations, based on various prices of copper, and has shown that the company will be able to earn good dividends on his minimum hypothetical selling price of 11 1/2 cents for copper, gold \$20 per ounce, and silver 50 cents per ounce."

The Redding G. & C. Co. has bought for \$20,000 the La Plant and Bedford group near Keweenaw; the Stabler group near Centerville; the White group near Igo, and the Sky Blue group at the mouth of Middle creek. J. White, of Redding, is superintendent. A smelter is projected.

A consolidation is reported of the Bully Hill C. M. & S. Co. and the Mount Shasta G. M. Corporation. The deal is partially a transfer by J. R. DeLamar of the Bully Hill Co. to the Mount Shasta people. The holdings of the two companies will hereafter be operated entirely under the name of the Mount Shasta G. M. Corporation.

J. Harkins will be superintendent Blackstone, Isabel G., U. S. and Sunrise quartz mines and Bugle and Malcomb placer mines, Shasta district, bought by S. Waterman, of San Francisco.

Thos. Gilbert, president Redding G. & C. Co., says he will build reduction works on the Sky Blue mine, one of the company's recent purchases on Clear creek, 8 miles west of Redding.

On Clear creek near Horsetown, Theo. Herritz, of the Detroit and California M. Co., is getting a gold dredge ready for the winter's work.

SIERRA COUNTY.

Superintendent J. H. Stewart of the New Enterprise mine—the old Grand Prize property—has men at work.

SISKIYOU COUNTY.

Thomas & Ridenbaur will unwater the Siskiyon quartz mine on Humboldt. J. O. Rusby received a boiler and pumping plant at the Y. R. R. depot for his mine at Deadwood creek.

R. C. Hoover, New York manager Cherry Hill Q. M. Co., is settling up all legitimate bills against the mine. The work will be started up again.

SONOMA COUNTY.

The Socrates quicksilver mine is sold by T. J. Butts to Haas Bros. of New York. He asserts: "The figure at which the mine changed hands was \$800,000, and the money is to be paid down within a few days." He further says that "the engineers and others have returned to New York and the necessary documents for the transfer of the property have been sent East."

STANISLAUS COUNTY.

A. Hayward and E. P. Newball, who some time ago formed incorporations to develop and manage their quicksilver mining interests in the Coast Range, have formed three companies, the Pioneer, Hazard and Stanislaus Quicksilver.

TUOLUMNE COUNTY.

(Special Correspondence).—The Sierra Electric Power & Water Co. are applying to the General Land Office for reservoir site, right of way and site for their power plant on the North Fork of the Tuolumne river. The company plans to convey

power and water to the town of Tuolumne.

At the Spring Gulch mine, K. C. Parrish superintendent, a survey of the underground workings has been completed by J. G. Hopper, county surveyor.

At the Hunter mine, a claim near by, recently bonded to the same owners, the ore shoot has been struck at the cost of a few feet of development work. The rock is reported high grade.

Sonora, Oct. 13.

The Laurel G. M. & D. Co. has levied an assessment of 2 1/2 cents per share, delinquent Nov. 5.

The Albatross G. M. Co. is incorporated; S. Tyack, G. W. Kingsbury, J. C. Sims, W. G. Drawn, C. W. Penniman.

The Mohican M. Co. has built a suspension bridge across the Tuolumne river below their property.

The Hunter and Spring Gulch mines, near Carters, have been bonded to K. C. Parrish of Denver.

An extension of the old Dead Horse vein is reported struck in the center of the town of Tuolumne. It is planned to put up a hoist and a 20-stamp mill. Another shoot of ore is discovered in the New Era mine on the 200-foot level.

COLORADO.

ARAPAHOE COUNTY.

The suit of Attorney General Post against the American Smelting & Refining Co. has been thrown out by the Supreme Court, the court denying the application of the attorney general to file and suggesting that he first file the suit in the District Court. This was the suit brought by Attorney General Post to dissolve the smelter trust for alleged extortionate charges in restraint of trade. He said he would at once file a suit in the District Court against the trust.

BOULDER COUNTY.

At Eldora the Boulder Creek M. & P. Co., of Bay City, Mich., proposes to build a plant of 10,000 H. P., and to remodel and make the old Coburn mill, 6 miles above Boulder, into a cyanide plant of 100 tons capacity. A dam will be constructed and 3000 feet of water per minute deviated through a 36-inch pipe 1500 feet long, to a Pelton wheel connected up to a dynamo developing 2000 H. P. A fall of 4 7/8 feet is obtained in the 1500-foot pipe. The properties have been developed by 3000 feet of tunnels.

CHAFFER COUNTY.

Manager Goodwin of the Salida smelter says that the smelting company is in the field for the purchase of ores from Leadville.

CLEAR CREEK COUNTY.

P. Schnarr and associates have sold the Cleopatra mine at Empire to Chicago men for \$10,000. The property is on Silver mountain. It has been a producer of high-grade gold ores, averaging from three to ten ounces in gold per ton.

Idaho Springs says that at a depth of 150 feet Superintendent G. T. Pickett of the International G. M. Co. has entered a vein of smelting ore in the shaft of the Morgan mine, rich in copper and containing gold and silver, the assays giving a value of \$130 to the ton. The company owns eighteen patented claims, which will be ent by the Monarch tunnel. The belt of porphyry at a depth of 150 feet in the Morgan shaft, Mr. Pickett says, extends through all the claims in the group, which indicates that a continuous vein runs through the properties of the company.

The Georgetown Courier says the Kelly tunnel has advanced 4 feet through the Great Western vein and the footwall has not yet been encountered. The tunnel uncovered on the hanging wall 5 inches of galena, expected to yield 60% lead, \$10 silver and \$3 gold per ton.

Manager R. S. Grier, of the Woodbury M. & M. Co., Breckenridge mountain, has applied for patents for sixteen mining claims. The 600-foot tunnel has intersected six lodes. The water rights of the company are ample for milling and power drill, a 60 foot fall being secured.

The Pittsburg company that owns the Dover mine, at the mouth of Fall river, and the Brighton group, beyond the Freeland mine, will work their properties on a heavier scale. The Dover mine will have a new air compressor and sinking and drifting continued. About 10 feet of good concentrating ore has been opened at 200 feet.

E. W. Williams, manager Specie Payment mine, says his company will rebuild the Donaldson mill, 2 miles west of Idaho Springs. A tramway connects the Specie Payment mine with the Donaldson, so that hauling of ores from the top of Bellevue will be avoided.

J. T. King, of the Stanley mine, and H. A. Ridol, of Colorado Springs, are planning the new 100-ton mill to be erected below the Stanley mine.

CUSTER COUNTY.

The Maverick mine at Rosita, the first

mine opened in the county, has been bonded to the Custer Mining & Realty Co. The old workings are a total wreck and the machinery of not much value. The new possessors will prospect the ground by means of a new shaft and some extensive crosscutting.

EAGLE COUNTY.

C. E. Taylor, formerly president Denver Mining Exchange, is in the Gore range, 17 miles from Wolcott. "We have plenty of copper," said Mr. Taylor, "and also a good fluxing ore which carries lime and some silver and gold. We have 1000 tons of copper ore on the dump, but as it runs only about 10% our first attention will be devoted to getting out the fluxing ore. This ore is in demand at all the smelters."

FREMONT COUNTY.

Wilbur reports wolframite running 72% tungstic acid.

The American Zinc and Lead Works, south of Canon City, owned by the U. S. R. & L. Co., is being rebuilt. Five of the thirteen furnaces contracted to be built are finished.

GILPIN COUNTY.

(Special Correspondence).—The Ann Rutledge G. M. Co., near Central City, has recently cleaned out, retimbered and sunk one of the old shafts to a depth of 115 feet. A drift of 75 feet has been run at the 50-foot level and another one of the same length runs at the 115-foot level. The ore ranges from \$10 to \$25 per ton and the pay streak is from 16 inches to 3 feet wide. Enough now has been demonstrated to show the advisability of putting a stamp mill on the property at an early date. A large amount of mine timber has been secured and piled up at the mine, and arrangements completed for putting on a larger force for sinking the shaft to a depth of 500 feet. From this shaft drifts will be run east and west every 60 feet. This illustrates what a small amount of capital well spent will do for a mine once worked for its rich surface deposits in the oxidized quartz, and which was abandoned because of the high cost of mining, transportation and treatment prevalent in the early days.

Central City, Oct. 13.

The Fairfield G. M. Co. have shipped a carload of smelting ore to Denver and have sent out over thirteen cords, or a little over 100 tons, to the Hidden Treasure mills at Black Hawk. All of these ores came from the shaft while they were sinking.

Kurri & Walhardt, operating the Ohio mine in the Vermillion district, have returns of \$245 per ton for first-class ore and \$119.38 per ton for second-class from the Chamberlain sampling works at Black Hawk.

At the Barnes mine on Quartz hill the shaft, now down 600 feet, is to be sunk 100 feet farther.

Central City reports the Mammoth M., M. & D. Co. organized, E. J. Adams of Apex manager.

Shipments of smelting ore, crude ore and mill concentrates to Golden, Denver and other points from Black Hawk for the first week in October totaled 108 cars, or 2160 tons.

New York men, who own the Manchester group in Pine district, will unwater the Manchester mine, after which developments will be carried on in the 200-foot level.

A new 200-ton concentrator is under way at Golden, which, when completed, will operate in conjunction with the Carpenter smelter.

GUNNISON COUNTY.

In the gold belt the Good Hope mine at Vulcan is producing more ore than ever. New properties are commencing to ship.

At Pitkin the Maid of Athens and Citizens mines are keeping up their usual output. A. E. Reynolds of the Colorado S. & M. Co. is prosecuting work on various properties in the district.

In the Tin Cup district the Gold Cup, R. E. Lee and Enterprise are shipping ore.

HINSDALE COUNTY.

Lake City reports the 150-ton concentrating and cyanide plant of the Tobasco Co. is in successful operation at the head of Burrows Park.

At the Tucker mine, in Quartz Valley district, goes in a new concentrating plant for the Lyons-Kyle M. Co.

A Lako City special says the 4 1/2 x 14 shaft at the Ute and Ulay mines is down 150 feet; good headway is being made with air drills; the mines are producing two cars high-grade concentrates per day, or about 200 tons crude ore.

Manager Dryden, of the Pelican mine, is planning running a lower tunnel from a lower level than the present.

LAKE COUNTY.

Leadville says that during August the A. Y. and Minnie mill produced 1050 tons of concentrates—lead and zinc. In September the same plant produced 2700 tons of the same product. In addition to this

the mine shipped 2000 tons of crude ore; with the two the output was nearly 5000 tons.

The Ibez is shipping 300 tons per day. Should the smelters be able to take more siliceous ores this output can be increased. By Nov. 15 the new mill at the Resurrection will be completed and ready to treat ore. The management will hoist 650 tons of crude ore daily for the plant. This means the employment of a larger force of men. The New Monarch o. is producing 250 tons daily and when their smelter at Salida is blown in will increase the tonnage 200 tons a day more.

SAN JUAN COUNTY.

The sale of the Pickett lode, in Poughkeepsie gulch, to Eastern men, by B. Duval, for \$40,000 is reported. A payment has been made and the buyers have taken charge of the property.

About fifteen men are doing development work on the Wabuse M. Co.'s property in Homatito basin, Tower mountain, under the formanship of W. Lonorgan.

SAN MIGUEL COUNTY.

The Telluride Examiner claims that "the State record for tunnel driving is now held by Telluride. Last month the Japan tunnel was advanced 269 feet, which is 9 feet better than any previous record made in Colorado, the Newhouse tunnel at Idaho Springs having been driven 260 feet in one month, which was the former record. Each man working in the Japan tunnel was paid a bonus of \$20 for his work."

SUMMIT COUNTY.

The Breckenridge Journal says that next month the Gold Pan M. Co. will commence work on its proposed drainage tunnel, to carry the seepage water or underflow off from its placer workings. The tunnel will be timbered and have an opening 6x7 feet in the clear. The source of the water way will be about 80 feet below the surface of the ground, the expense approximately \$100,000.

At Breckenridge the Gold Pan has struck bedrock in their pit.

The Cashier mill is to be doubled in capacity and when fully in good working order will be again enlarged to a 60-ton, quick drop mill.

McDougall Bros. are taking out ore from the Black Hawk and DeSoto in Swandyke.

Manager F. M. Lindsley of the Free America mine at Kokomo will begin shipping ore.—The Boston group, on Gold hill, has been sold for \$22,000.—The Smuggler, Peerless and Matchless mines, on Fletcher mountain, have been leased and bonded to Anderson & Lindsley.—Ore has been struck in the Connors Bonanza tunnel, which is in about 1800 feet. They did not expect to strike ore before they had gone in 3000 feet.—Two new magnetic zinc separators have been put into the concentrating mill of E. E. Byron at an expense of \$10,000.—The Michigan mine, owned by G. T. McDonald, has men breaking ore.

TELLER COUNTY.

A strike is reported in the Shurtlo on Bull bill. The property is leased to the Valley City leasing company, which has spent \$45,000 on the property without result. The shaft is down 75 feet. In a trench 8 feet from the bottom a vein 3 1/2 feet wide is uncovered. Assays run \$80. It is sylvanite ore in phonolite and basalt formations.

On Cow mountain a tunnel has been started by the Clinton Con. Co. The portal is on the southwest base of the mountain. It is the intention to drive it in 3000 feet, at which point it will attain a vertical depth of 2000 feet. The tunnel will crosscut the veins of the mountain on its strike and ore should be opened, if there is any in the mountain.

The Colorado Springs Gazette estimates the number of men at present employed in the Cripple Creek district at 6200.

Johnson & Co., leasing on the 200-foot level of the main working shaft of the Pharmacist, have opened up over 5 feet of ore that assays indicate will average \$50 to the ton.

At Victor the War Eagle mine, in the bottom of the 35-foot shaft, has a vein of ore averaging in width from 13 to 15 feet, values running \$25. The lessees are taking out 100 tons per week.

J. T. Milliken, president of the Golden Cycle M. Co., has secured control of the Theresa property.

Daily output from Stratton's Independence mine now amounts to between 250 and 285 tons of ore.

Two to three carloads of 20-ounce quartz is being shipped weekly from the Kelley claim on Raven hill.

The Gold Coin, in process of opening up the old Dorothy vein in the 900-foot level, has opened up 300 feet of ore that runs from 2 to 3 ounces per ton in value.

Cripple Creek drainage now involves three propositions, before a committee appointed by the mine owners, the Newell, Bainbridge and Von Rucceau tunnels.

The first-named would afford temporary relief in a short time. The depth at which it would tap the main watercourses of the camp would be less than 100 feet below the standard tunnel level. The Bainbridge proposition would afford drainage 250 feet below, but would still be above the 1000 feet point, cutting the Elkton at a depth of 950 feet. The Von Rucseau is planned to cut the Elkton at a depth of 2650 feet and the American Eagle and the deepest point on Bull hill at 3700 feet, cutting below the district at an average depth of 300 feet. The Bainbridge tunnel would depend for funds on the mining corporations; the Newell or Rucseau propositions would entail no expense on the mining corporations until results are attained.

Another drainage tunnel project, the Oro Com. & D. T. Co. is being financed in the East. This would start on Wilson creek, 2 miles south of Victor, cut through Straub mountain at a depth of 1400 feet, and head for the Portland mine, which it would cut at 1700 feet.

On Squaw mountain seventeen properties are under development, employing fifty-five men averaging \$3.33 per day.

On Gold hill 540 men are at work, receiving a daily payroll of \$1764. Work is going on at thirty-three different places on the hill. The largest force of men employed is on the Stratton estate, where eighty men are at work on the Abe Lincoln and twenty-five on the Chicago & Cripple Creek property. The tunnel has been pushed in 3000 feet and has connected with the Globo hill properties at a depth of 728 feet, affording ample air and ventilation for the Globo hill properties. Mr. Stratton bought this tunnel for this purpose, and while some good ore bodies have been encountered, as in the Caille claim, its main object was for ventilation.

On the Anchoria-Leland fifty men have employment. Enough ore is being taken from the Cenundrum to meet all expenses. The Moon-Anchor is ready to resume mining of high-grade ore as soon as its ore shoots, now submerged, can be regained. This company is vitally interested in the deep drainage tunnel of Cripple Creek.

The C. O. D. property in Poverty gulch, under bond and lease to T. B. Burridge, is in ore.—On Tonderfoot hill work is being pushed on six properties. There are thirty-nine men employed, receiving an average of \$3.33 per day. The monthly shipments from the producers average 190 tons of \$55 ore, aggregate value being \$10,450.

IDAHO.

BLAINE COUNTY.

At Haley there are eighty miners at the Minnie Moore mine. The ore body on the 900-level is exposed for a length of 250 feet.

C. C. Ruthrauff, 30 miles west of Halley, has returns from a recent mill run on the ores to save \$19.20 in gold, \$1.15 in silver and \$5 in the tailings.

CUSTER COUNTY.

S. V. Le Sieur says he has found a "mountain of opals" on Panther creek, 45 miles northwest of Challis—a mount of porphyry near the summit of the range. "In this porphyry the opals are embedded and the matrix is so full of stones that fifty can frequently be taken from a chunk no bigger than a man's head. Most of them are broken, as the porphyry in which they are embedded was broken off from the ledges, and, when thus broken, appear in the matrix closely resembling pitch in a pine board."

IDAHO COUNTY.

The Dewey mine in Thunder mountain is working forty-two men. Superintendent Erwin says he expects to do about 500 feet of development work this winter. All ore now being milled is taken from development work. No stopping has been done.

At Buffalo Hump, thirty stamps are dropping on Crackerjack and Big Buffalo, owned by C. Sweeney, of Spokane. It is low-grade, free-milling ore.

LEMHI COUNTY.

(Special Correspondence).—The Calumet & Hecla G. M. Co., Ulysses, have just completed their new mill on Indian creek, about 45 miles from Salmon City. They will be able to handle about seventy-five tons of ore per day. The mill is 15-stamp amalgamation and concentration. The ore is free milling and will average about \$10 per ton. They are able to make about 80% saving on the plates. They have about $\frac{3}{4}$ of a mile of tramway and about 1 mile of flume. Also have 150 H. P. water power and a good steam plant. The plant is of the latest style and first-class in every particular.

Salmon City, Oct. 10.

At the new mining camp of Pattison the Ima Con. M. & M. Co. has been building. The company owns twenty-three claims on the north and south sides of Pattison creek in Lemhi county, 57 miles from Mackay. Mr. Knight is manager.

He is building a concentrator, daily capacity 100 tons, to be running by Nov. 15, when he will employ 100 men. He intends to run the mill for a year, and if satisfactory will add to the plant, increasing the capacity to 900 tons daily. The camp is lighted by electricity and has a system of water works and sewerage. The mines lie in the center and on each side of the gulch and are developed by tunnels, one of which is in 1200 feet and another 800 feet; the other claims will be tapped from these tunnels. The ore carries silver, gold and copper, the silver values being best, assays running \$75 per ton.

SHOSHONE COUNTY.

The board of directors of the Frisco Con. M. Co. want the stockholders to authorize a \$100,000 issue of bonds, with which to wipe out existing indebtedness, some of which is owed to the president of the company. It is stated by the directors that with the money from the bonds enough can be secured to pay the debt of \$30,000 and leave a balance on hand sufficient to commence operations. It is further stated that changes are in contemplation by which \$3 a ton on concentrates can be saved, and that it is believed that the mine can soon be operated at a profit. The directors also say that there is a movement under foot by which all the mines of the district are to be sold and that it would be better for the company to have a working mine when that time comes than an idle one. Further, the directors want authority to reduce the capital stock from \$2,500,000 to \$500,000, so that the company may save \$2000 a year in taxes. They say: In May, 1901, a contract was entered into between the company and the American Smelting & Refining Co., by which the company was to receive \$18,000 per month for a period of eight months from the smelting company. "This enabled us to reduce our indebtedness to the smelting company to the extent of \$30,000. On January 1, 1902, a new agreement was entered into, by which the smelting company paid us \$6000 a month, but they refused to make a new contract of this character on July 1, 1902, since which time the money has been furnished by our president for the purpose of keeping the water out of the mine, and the mine has been idle."

Near Mullan, the injunction served on the Gold Hunter M. & S. Co., at the request of the Yolande M. Co., has been set aside and the former can continue taking ore from the property of the latter company. The Hunter Co. has resumed work on the property.

At Delta the dredger of the Northern G. M. Co. is in operation.

R. I. Gleason, consulting engineer of the Rocky Mountain division of the Northern Pacific, has started out on the Cœur d'Alene branch with a party of engineers to make important changes. The party consists of twenty men. It is said that the Northern Pacific will take a step that has been contemplated for several years—that of changing the main line business and running it over the Cœur d'Alene line via Mullan and Wallace to Spokane. This plan has been considered feasible for some time and would shorten the line between here and Spokane by 80 miles. The Cœur d'Alene branch as it runs at present has some curves that are too short and some grades that are too steep to be acceptable for main line business.

J. G. Forester will put in a large cyanide plant at the Golden Chest property, near Murray.

Near Mullan, T. Donnelly, manager Snowstorm M. Co., has returned from the East with capital to continue development work on the Snowstorm property.

The Bunker Hill & Sullivan M. Co. will build a heavy dam across the south fork of the Cœur d'Alene river, near the mouth of Pine creek, to hold tailings.

Since the adjustment of the differences between the Cœur d'Alene mine owners and the lead trust the shipments of ore from that district have been phenomenally heavy. It has been difficult during the past week to get cars enough to handle the large amount of ore offered for shipment, and it is only within the past few days that the railway company has begun to catch up with the output of the mines. Wallace is busier than it ever was before; the entire Cœur d'Alene district has recovered from its recent depression and is on the top wave of prosperity.

Near Burke, after working on its property for nearly the past five years, the Sonora M. & M. Co. has encountered the lead at a depth of 600 feet in from the mouth of the tunnel 900 feet. It has been crosscut for a distance of $\frac{1}{2}$ feet. The ore is galena. The company owns twelve claims and a millsite.

KANSAS.

WYANDOTTE COUNTY.

A. R. Meyer, a director of the American S. & R. Co., is quoted as saying that the Argentine smelter, which was dismantled a year ago, will be reopened and

operated. "The Argentine smelter was closed down," said Meyer, "because the American S. & R. Co. had an excess of refining capacity. The plant has possibly the best location of any the company owns, and will not be abandoned."

MONTANA.

DEER LODGE COUNTY.

The Inter-Alta M. Co.'s gold properties at the head of Gold creek, 20 miles north of Anaconda, show a ledge of gold ore.

The Ontario mines group, 12 miles from Ellison, on the Northern Pacific Railroad, are to be unwatered. Extensive improvements in the way of new machinery are contemplated.

GRANITE COUNTY.

P. Mussighred, of Warm Springs, who owns sixteen mining claims and a 10-stamp mill at Garnet, suspended operations for the season. The shaft on the mine from which the bulk of the ore has been coming is 200 feet deep, which is about the limit of the machinery. To go deeper heavier machinery is necessary. When work is resumed, it will be on a larger scale, as the property will then be equipped with machinery necessary to do the work. P. O'Neill has had recent charge of the work. The former manager, M. Genzberger, had sunk the shaft 600 feet, cutting a vein of copper-silver ore. At a depth of 510 feet there was nothing to it. Exploration has cost nearly \$200,000, nearly 500 feet having been sunk in gravel wash.

JEFFERSON COUNTY.

The Basin & Bay State M. Co., at Basin, have leased all of that company's properties to F. A. Helms for four years, with an option to purchase the entire outfit at that time for \$345,000.

LEWIS AND CLARKE COUNTY.

The Montana Empire cyanide plant, near Marysville, has resumed operations with a daily capacity of 500 tons. J. L. Malm says the entire plant has been rebuilt at an expense of about \$16,000. He has installed a system of leading by automatic belt conveyors, which will facilitate the work, and has put in an electrical precipitation apparatus. On the dump there are now 125,000 tons of tailings, which he will work over by the process.

MADISON COUNTY.

The Gold Hill mine, near Parrot, is reported bonded to F. A. Helms of Butte; consideration, \$40,000.

At Rochester there are 113 men on the payroll of the Watseka and 17 on each shift at the Elgin, a mine near the Watseka.

At the Monitor-Revenue claim, Richmond Flats, a new up-to-date steam hoist is hoisting gold ore from the 160 foot level.

The Kennett M. Co., Richmond Flats, has thirty miners opening up new ground.

MISSOULA COUNTY.

A rich strike is reported at the 260-foot level by the Amador C. & G. M. & M. Co.—a body of copper ore 10 feet in width; on either side good milling ore.

PARK COUNTY.

At Jardine work on the new mill for the Bear Gulch Co. is proceeding. J. M. McNulta, manager Milwaukee M. Co. at Contact, has increased force at work.

SILVER BOW COUNTY.

C. A. Couch, of Boston, has acquired the Gold Hill mine, which adjoins the Bald Butte, and is sinking a shaft.

The mill at Kendall is crushing 300 tons of ore daily. The bulk of the ore comes from the west cut, now 75 feet wide and 100 feet deep. The new shaft is down 250 feet, where drifting goes on. The company's refinery is ready for work.

NEVADA.

DOUGLAS COUNTY.

Messrs. Wedekind and Blackburn, at the Golden Gate mine in Roderico canyon, have a large body of ore.

ELKO COUNTY.

H. G. Weston is developing the Baltimore group near Elko.

EUREKA COUNTY.

Ore shipments by rail from mines in Eureka district for the week ending Oct. 10 were as follows: Diamond, 126,900 pounds; Eureka Con., 122,960; Excelsior, 55,770; Jackson, 36,130; Richmond, 33,250. From Hamilton-Recco-Homestake, 51,280 pounds.

HUMBOLDT COUNTY.

Chicago men have bought the Foltz placer at Spring Valley for \$40,000. The property is 12 miles south of Unionville, 28 miles from Mill City, a railroad point on the Southern Pacific, about 100 miles from the California line. The Consolidated Placer Co. has been formed. J. P. Fitting becomes general manager for the new company. The placer beds have been worked for forty-five years and have produced \$3,000,000, which was taken from

shafts $\frac{3}{4}$ feet square sunk to a false bed-rock, from 6 to 75 feet below the surface. The beds along the low lands were never worked because of the superabundance of water which could not be drained off, but which can be successfully handled now. Twenty-three years ago J. B. Foltz purchased 280 acres of these diggings and exclusive rights to water along Indian creek, 9 miles distant. This water the new company will convey through 16-inch steel pipes to the placer. A dam has been constructed across Indian creek and a reservoir of a capacity of 20,000,000 gallons built. The water will be delivered to the placers with a fall of 200 feet and a pressure of 130 pounds to the square inch.

LINCOLN COUNTY.

J. Bone, who recently bought the McGregor mines, El Dorado canyon, has a few men at work and will increase the force.

J. B. McKee, Silver King district, Bristol, Nev., will develop his property there.

NYE COUNTY.

The 60-mile pipe line from Twin rivers to Tonopah will be finished in June, 1903. The 12-inch pipe is of fir, sawed to conform to the segments of a circle, coated with tar and wound with heavy galvanized iron wire. With a pressure of 250 pounds the water is forced through the pores of the wood; in the gullies and other places along the line where the pressure is high iron pipe will be used.

The option held for some time on a group of prospects at Pactolus has been dismissed, the men employed under it paid off and discharged and the mines shut down.

STOREY COUNTY.

East crosscut No. 2, which was recently started in the northwesterly drift on the 425 level of the Gould & Curry mine, is being advanced in porphyry and low-grade quartz.

On the 1600 level of the Mexican mine, the south drift from the west drift was stopped in porphyry and stringers of quartz after attaining a length of 31 feet, and a north drift was started to explore the quartz. When the north drift was in a short distance the quartz split up. Work has been resumed in the west drift, which is now in porphyry and quartz.

At the Union shaft the joint Sierra Nevada and Union Con. east drift from the station on the 1600 level is in 28 feet. The face is in hard porphyry. The south lateral drift from the joint west crosscut, 294 feet in, now has a total length of 49 feet and is in vein porphyry.

All prospecting work on the 220 level of the Union Con. mine has been stopped and the air pipes, rails, etc., are being removed to the surface.

In the Utah Con mine the station at the foot of the upraise in the north drift from surface tunnel No. 2 has been completed and they are now sinking a winze at this point in ore showing low value.

On the Brunswick lode grading for drill hole No. 3 is about completed and the drilling plant will soon be brought there from No. 2 hole for installation.

The water in the Chollar Combination shaft is slowly going down, being 160 feet below the measuring point. At the C. & C. shaft the large nozzle on elevator No. 2 has been replaced with a smaller one, and both Nos. 1 and 2 elevators have since been running alternately and are easily keeping the water down to the required point below the 2150 level station.

WASHOE COUNTY.

At the Sparks mill, Wedekind City, twenty men are at work; the mill is running steadily at the rate of twenty tons a day. The capacity will be seventy-five tons when the full equipment is received. The melting plant has been received and sulphides are being reduced. Shipments of four bars of bullion will be made daily.

C. Golding of Wadsworth has leased the mill of the Wadsworth M. & M. Co., in Olinghouse gulch, for a term of years.

The Colorado-Nevada M. Co. has started an upraise in a seam of ore on the 200-foot level.

Some ore from the Desert King mine, 4 miles from Reno, goes \$1 to the pound in silver and three ounces to the ton in gold. It was formerly known as the Wedekind-Bell mine. The shaft is 127 feet in depth; a vein 15 inches wide is in the bottom of the shaft. The ore is smelting.

WHITE PINE COUNTY.

At the Pilot Knob, near Ely, a large body of low-grade ore has been opened up by Superintendent Edwards. In the Ruth group, owned by Gray & Bartley, ore averaging 3.5% copper, \$4 in gold and three ounces silver has been uncovered at a depth of 300 feet.

NEW MEXICO.

LINCOLN COUNTY.

The Benito M. & M. Co. will do a general mining and milling business. C. C. Bourne of Nogal is agent.

The Eagle M. & I. Co., of Chicago, has

designated Parsons as the principal place of business and J. M. Rice as agent.

TAOS COUNTY.

The Otto M. & M. Co., is incorporated at Tres Piedras; directors, F. Bolton of Taos, O. Rosenfeld and J. W. Sibben, Manistee county.

OREGON.

BAKER COUNTY.

At Sumpter forty men are employed on the Olive Lake water power system by the Red Boy M. Co. to raise a dam 50 feet high, 450 feet long, base 60 feet, top 20 feet. Engineers estimate that an expenditure of \$150,000 will complete a plant assuring water for 2000 H. P. the year round, generate electricity for running hoist and compressor plants and supply other mines there.

T. W. Davidson has charge of development work on the Yellow Daisy group, near the Red Boy.

At the Bonanza mine the shaft is at the 800 foot level; a station has been cut on the 700-foot, and a crosscut started for big vein; sinking is constant under the contract system \$30 a foot being paid for the triple-compartment shaft. The 40-stamp mill of this property may be opened late this year.

J. J. Fawcett, owner of the Psyche, says the 20-stamp mill on the property is going up rapidly.

The foundation of the 70 stamp concentrator of the California mine is laid; the site for the 2899-foot tram cleared, and the contractors have begun erecting the stations for this line. Superintendent Walker expects to get the plant in shape before Jan. 1.

A. M. Paul, superintendent Imperial property, will sink 200 feet. J. Bourne, of Portland, and C. W. Nibley, of Baker City, own this property.

At the Columbia mine Manager Bailey is at work on a water power plant to generate 100 H. P., to make a big saving in the wood bill. At the present time the Columbia has wood cut aggregating in cost \$17,000.

The Baisley-Elkhorn mine is sold to F. P. Hayes and associates, price \$100,000, which includes all indebtedness against the mine. It has a 30-stamp mill.

Sumpter says another rich strike of ore has been made in the North Pole mine of the Cracker Creek district.

In the Morning Star group, Mormon Basin district, men are developing the claims. On the summit of the mountain between Shasta gulch and Mormon basin an Eastern company is locally credited with intention to spend \$75,000 on the erection of a 20-stamp mill and other improvements. A good body of ore has been uncovered. A 10-stamp mill is being built on the Kidd & Tedrowe property. W. E. King is carrying on extensive operations at the California, on California ridge. The mill is running night and day.

The Red Boy mine is going twenty-four hours each day. The May Queen is sinking on the shoot opened by tunnel. At the Blue Bird, Superintendent Thorpe is figuring on a mill. On the Oregon Monarch twelve power drills enable the management to progress with speed. The Chelan, operated by W. E. Hurd, has two forces working, one on the Bailey and the other on the Chelan. Superintendent Barrett has resumed work on the Grand Union, driving the Concord vein. The tunnel is in more than 300 feet. Work on the hoisting plant at the Excelsior mine is being rushed.

GRANT COUNTY.

The Quebec, 2 miles from Alamo, has a 10-stamp mill; active work is temporarily suspended; C. McMahon is manager. The Oro Fino, adjoining, has 800 feet of tunnel and bodies of free gold, panning metal, and concentrating ore; it is locally reported that the building of a 20-stamp mill is projected. The Aldrin Tunnel Co., W. Wade, manager, has run 1900 feet of double-compartment tunnel. A depth of 900 feet has been attained. The tunnel will be extended to a total length of 3000 feet. Two ledges have been cut, one ledge 6 feet showing average ore values of \$6 per ton.

The Magnolia mine at Granite will have an increased number of men at work in both tunnels, preparatory to starting the stamp mill in the spring.

A suit for the sale of mining claims, so that the proceeds may be divided between the three owners, and for the payment of \$50,000 to J. H. Parker, has been transferred to the United States court. Mr. Parker asserts in his complaint that, together with the defendants, he is owner of the La Belleview, South lode, Lolita lode, Hope lode, Mountain View lode and the La Belleview and Wild West mill-sites, known as the Cable Con. quartz mining claims. He also alleges that he has a lien on the claims for \$50,000. The plaintiff then avers that the property can not be partitioned without prejudice to the owners, and he therefore asks the

court for an order to sell the property, the first \$50,000 of the proceeds to be paid to him and the remainder to be divided between the three men.

The Cougar mine at Granite will resume.

The Paragon group of claims between the Cougar and Magnolia will be developed.

JOSEPHINE COUNTY.

The Simmons & Cameron mine, Waldo, has been worked fifty years and has enough ground in sight to keep the giants busy for years to come. A 1200-foot tunnel is being run to allow the passage of a waterway and make possible the working of ground that could not be reached in any other way.

B. E. Meredith, manager and owner of the Meredith placers, Waldo, has returned from Chicago and will work the properties for the fourth season. It is in these placers that a Philadelphia company has been mining for platinum the past summer and have had good success. It is there, also, that the metal, Josephinite, is found in quantity. One feature is a 1200-foot tunnel driven through solid rock, being necessary to let the main flume through to the working grounds of the mine.

The Old Channel mines, Galice, will begin work whenever water is afforded. Three giants will be operated. The placer bank has a length of 1300 feet, and a height where it is being piped of 230 feet. Such a bank as this can only be worked from a distance of 400 feet, requiring a pressure of 500 feet in the giants. This carries values all the way from the grass roots to the bedrock, carrying fine gold in the clay capping and coarse gold in the lower strata.

Manager W. H. Hampton, of the Columbia placers of the Grave creek district, is in readiness for work. He will operate two and three giants in the diggings this year. Three other giants are required to operate the elevator for removing the waste. Arc lights are suspended above the diggings for night work. The banks are a gray and red gravel, carrying values in fine and coarse gold. They occupy the bed of an ancient channel.

J. C. Whipp has located the Josephine county caves under the placer mining laws to mine. It will require 6 miles of wagon road before stone can be hauled out. He has located and entered 1320 acres, which cover all the caves and land adjacent.

W. H. Brevoort of New York is at Greenback. He is the owner of the Greenback mines and mill and has arranged for ten new stamps with a battery of twenty, to be supplemented with a filter press of German invention to treat the slimes. The workings have attained a depth of 900 feet.

SOUTH DAKOTA.

CUSTER COUNTY.

The Central Black Hills C. Co. has been incorporated by Drake, Barnes & Co. of Cleveland, O., they having purchased the Richard Palmer ground on Spring creek, near Custer. E. M. Barnes is preparing to install a 200-ton leaching plant, to employ a process of his own in leaching the ore. He claims to be able to treat ore of the character found on the Palmer ground running as low as 1% copper, successfully. The company has a vein of copper carbonate ore averaging 3% at a point 200 feet above water level. Mr. Barnes says he operated a similar plant successfully in Arizona.

The Copper Cliff M. Co. has men on its property, 2 miles north of the Black Hills Co.'s ground, taking out graphite for shipment to Chicago; C. Fohrman is manager. He says there is a demand for it at a good price.

LAWRENCE COUNTY.

Deadwood says that the University M. & M. Co. has bought the thirty-two acres of mining ground that belonged to the South Dakota M. Co., on Annie creek, and is at work on the deposits of siliceous ore, getting ready to begin mining and milling. The work is in charge of R. Fitzgerald, formerly of the South Dakota Co. He has a mill in view to treat the ore by the cyanide method.

The Lucky Strike M. Co. will build a stamp mill on their mining property on Box Elder creek, near Roubaux.

The Spearfish M. & S. Co., in a relief clean-up at the mill for the first part of September, got a return of over \$6400. A large body of pay ore has been opened up in an entirely new location. It is 7 feet in width and extends into the side of the hill.

UTAH.

BEAVER COUNTY.

A 15-mile race, with a mining claim as the prize, was won by J. Douglas of Milford. The claim involved was the Copper King, located in the Granite range between Beaver and Milford. E. Clark of Richfield sued Stoddard & Kirk of Mil-

ford for possession of the claim. The case was tried; late in the afternoon the judge decided the case in favor of Clark, as against the defendants, but in his decision intimated that Clark's failure to go ahead and perform the assessment work when he had an opportunity to do so amounted to an abandonment of the claim, which would leave the ground open for relocation. This decision was immediately telephoned to Milford, and Douglas started for the ground. He reached the claim in an hour and a quarter and posted a location notice. W. Robinson followed him two hours later and witnessed his location. Meantime J. Gray, acting for Mr. Clark, started from Beaver and arrived later. He also posted a location notice for Clark & Davis. He was followed by E. Pollett, who was a witness for the later location. If the claim is of any value there will be the usual litigation in such cases.

At Milford the Gomer group of two claims in the heart of the Majestic company's Harrington-Hickory group is bought by the Majestic Co. for \$20,000, \$1000 down, \$4000 Dec. 3, \$6000 Feb. 3 and \$6000 April 3.

JUAB COUNTY.

The 900-foot shaft on the Godiva will be sunk to a depth of 1500 feet.

At Eureka Superintendent Matthews of the May Day has a body of silver-lead ore. A machine drill is heading for the ore channel on the 250-foot tunnel level, 900 feet below the surface of the ledge.

SALT LAKE COUNTY.

Work is to be resumed by the Pine Tree M. & M. Co. near Bingham.

The St. Joe long tunnel is now in 1560 feet, 3 to 6 feet per day being made in hard rock. Manager Hasbrouck says the tunnel is nearing a vein, from which a raise will be made for air. It is flowing about 150,000 gallons of water daily and the volume gradually increases; present vertical depth 500 feet.

The Morning Star at Bingham is to open up the ledge by which it is traversed, the Frisco tunnel will be extended and an air compressor and machine drills will be put in.

SUMMIT COUNTY.

The Park Record reports the shipments of ore from the Mackintosh sampler for the past week as follows:

	Pounds.
Daly West.....	2,810,000
Ontario.....	922,000
Anchor concentrates.....	257,000
Loring Bros.....	147,000

Total.....	4,036,000
Silver King.....	1,581,140

Grand total.....5,617,140

TOOELE COUNTY.

At Ibapah, Superintendent S. F. Whitney of the J. P. Gardner mines says he has pumps with capacity of fifty-five gallons per minute, and on the 20th will begin unwatering the property.

The Midas M. & M. Co. has its new 60 H. P. boiler and 50 H. P. engine.

WASHINGTON COUNTY.

The Paymaster group, St. George, is under bond to A. J. Malloy of Cripple Creek, Colo., for \$80,000.

WASHINGTON.

FERRY COUNTY.

Development work on the Gold Ledge, Republic, has closed down indefinitely. Lack of funds and of a market for the ore is the reason for the suspension.

OKANOGAN COUNTY.

A. B. Lee of Wooster, O., Eastern agent Six Eagles M. Co. at Loomis, says he will be able to raise all the funds necessary to make a paying mine out of the Six Eagles.

WYOMING.

ALBANY COUNTY.

The Rambler M. & S. Co. has held its first monthly meeting. The services of a mining engineer from the East have been secured and he will take charge of the property. Development work will be pushed throughout the winter. The principal stockholders in the new company are M. M. Green and W. H. Webber, Laramie; J. F. Shelton, O. Harrell, G. W. Harnden, E. Freeland and C. W. Cheney, Shelbyville, Ind.; F. M. Wooten, J. A. Swenson and N. O. Stoucks, of Madison, Wis.

L. Miller, superintendent Queen M. Co., has assays on ore from the Colorado mine, Jelm district, \$29.52 in copper, aside from a paying percentage of gold.

CARBON COUNTY.

The aerial tramway of the North American C. Co. is finished. It connects the Ferris-Haggerty mine with the smelter at Encampment. The buckets contain 700 tons each of ore and are carried over the lines at intervals of half a minute, being dumped automatically. There are three cables, the traction cable, which is continuous, and two track cables between the

stations, the buckets being automatically transferred from one track to another at stations. This gives the tramway a capacity of 984 tons a day. On the line there are 270 spans, averaging 200 feet. The longest span on the line is near the Blackfoot property, 2200 feet. The general raise on this span is 800 feet, the highest point is 225 feet above ground. The loftiest tower is 69 feet high and has an altitude of 9922 feet above sea level. The line is so constructed that spurs can be built off from it at any point along the tramway. Number of towers, 270; four tension stations are double; number of feet of cable, 293,275, weighing 439,696 pounds; number of feet of timber used, 1,250,000; average number of men employed for six months, 200; cost, \$300,000.

Rudofeha reports that in a crosscut of 65 feet at a 60-foot level the Osceola Copper M. Co. has found a lead apexing on its property adjoining the Ferris-Haggerty on the south. The new discovery is held to be of importance because it is thought to demonstrate that ore there lies in large and continuous bodies instead of in pockets.

FOREIGN.

BRITISH COLUMBIA.

At the Broken Hill M. & D. Co., 7 miles east of Ymir, twenty-four men are working. The ore is free milling and carries values in gold, silver and lead. A mill capacity of twenty tons per day goes in.

Shipments from Rossland for the week ending October 11, and for the year to date, are as follows:

	Week. Tons.	Year. Tons.
Le Roi.....	3,710	176,716
Le Roi No. 2.....	952	50,951
Center Star.....	1,830	15,381
War Eagle.....	1,380	8,046
Rossland G. W.....		2,400
Giant.....	90	2,575
Cascade.....		300
Columbia-Kootenay.....		30
Bonanza.....		90
Velvet.....	110	800
Spitzee.....		20
White Bear.....		5

Totals.....8,072 257,314

The Nickel Plate mine, in the Similkameen country, near Hadley City, will have a 60-stamp mill and concentrator in operation by next spring. M. K. Rogers is manager.

MEXICO.

(Special Correspondence) — The Fernando M. Co., San Fernando, Durango, are building a wagon road from Culiacan, Sinaloa, Mex., to their camp, a distance of 85 miles. Courtenay de Kalb is general manager of the company.

C. F. Jaques has resigned as purchasing agent of the Cananea Con. Copper Co to take a position on the road with Baker & Hamilton of San Francisco.

The Yaqui S. & R. Co.'s office in Hermosillo and works at San Antonio de la Huerta, District of Ures, have purchased new smelting machinery, which they state will be in operation in one year.

Geo. Mitchell, general manager of the C. C. Co., claims to have a second Cananea in a new mine, the Mitchell M. Co., 35 miles from Acapulco.

A. W. Buchard, second vice-president and controller of the C. C. Co., left Cananea for New York the first of the month.

N. B. Roper is consulting engineer for the Cananea Con. Copper Co.

Thos. Chase Paxton of Los Angeles, president and general manager of the Loma Verde Copper Co., near Tucson, returned to Tucson from a visit to the coast. Cananea, Oct. 10.

Zacatecas reports that the San Rafael mines, reduction works and machinery have been sold to A. E. Stillwell for \$160,000 cash.

The Guggenheim Exploration Co. is reported to have bought the gold mines and a small smelter at Vellardena for \$5,000,000. The principal owners of the property were E. W. Nash and G. C. Barton of Omaha and Mrs. J. Mathews of Denver, Colo. "The Guggenheim Exploration Co. has been negotiating for the property, I know, but I do not know if it has succeeded in acquiring it," says J. B. Grant. "The smelting company has no interest in the deal as a company. However, if the Guggenheim Co. does acquire the property, it is probable that the smelting company will erect a big smelter there to treat the ores. In that way only will the smelting company be interested."

DURANGO.

(Special Correspondence) — The La Reina G. M. & M. Co., Mapimi, have an incline shaft down on their property 240 feet and have done 200 feet of drifting on the vein from the shaft. The vein averages in width from 6 to 9 feet and will run \$20 per ton gold. They will erect a mill for the treatment of the ore, which is a

cyanide proposition as well as free-milling. R. L. Wotton of El Paso, Texas, is manager.

The Ujela mine at Mapimi was worked 300 years ago by the Spaniards. The company has finished a 600-ton smelter in addition to the one they already had of 800 tons capacity. They are handling 1200 tons per day. They are only working their low-grade ore at present, as they have a concession from the Government by which they can ship their bullion out free of duty if it is 50% lead. They have 1000 houses at the mine for the use of their men. The property is controlled by a French company.

Mapimi, Oct. 11.

At Mapimi is being developed the Ouella mine, belonging to the Pinales M. Co., made up mostly of German capitalists. The reported yield is \$4,500,000 per year. A trainload of the lead and silver hullion leaves the smelter daily to be shipped to the United States and Germany. The company is now erecting a plant for the recovery of arsenic which will be made into an important item of revenue which is now lost. The arsenic is so excessive in quantity that it causes sickness. The ores there need the siliceous ones of Parral for fluxing purposes and the smelter pays a premium for them.

C. Reid, manager Compania Minera de Penoles, at Mapimi, denies the reports of the excessive death rate at the mines of the company at Mapimi and that the mortality was due to arsenic in the drinking water. He states that the civil register of deaths is 132 for this year as against 111 for the corresponding period of last year, and that the water is in no wise the cause of the sickness. He says further that every year there is more or less intestinal trouble among the native workmen, due to eating stale fruit, etc., and their habits.

OAXACA.

An American miner, returned from Oaxaca, tells the El Paso Herald that in the mines of Oaxaca "labor, the great desideratum in mining, is so cheap that an honest American can hardly look his men in the face when he pays off."

"There are two systems of labor prevailing in the hiring of miners; one to pay by the running meter and the other day wages. The former costs \$7 to \$9, Mex., per meter, and the drifts and tunnels are 5 feet high and 4 feet wide. The rock is very hard. For this class of work the miners, the Indians of the country, furnish their own caps, fuse, powder and candles, delivered at the surface by the mine owners at 50% advance on the cost. Thus the cost is about \$1.66 per foot in gold.

"On day work a good drill man can be had for 75 cents Mexican money and a helper at 50 cents. These two men furnish their own candles, powder, caps and fuse, supplied them at the usual 50% profit by the mine owner. Some drill men get only 50 cents a day and furnish nothing but their candles.

"Where Mexican mill men are employed they get \$3 per day, Mexican money; carmen get 36 cents a day and furnish their own candles. An ore sorter gets 25 cents a day, and his wife who helps him gets 12 1/2 cents.

"These laborers are slow workers, but they are faithful and patient, and can be depended upon. They can be hired as "cargadores," or carriers, for about 25 cents a day. One of them can carry 100 pounds 25 or 30 miles a day and make the distance quicker than an American will on horseback."

SINALOA.

The Rio Yaqui International Transportation & Metallurgical Co. is organized in Denver, Colo.; C. S. Thomas, L. M. Goddard, W. Faulkner. They have eighteen mines in the Rio Yaqui valley, 125 miles from the Gulf of California, 175 miles southeast of Hermosillo. The mines carry silver, gold and copper; all of them have been developed, some having been worked for thirty years. The mines are nearly 200 miles from a railroad and only the richest of the ore has been shipped out. There is said to be now on the dumps 150,000 tons ore. The plans of the new company include the building of a smelter at the mines, or some near-by point, whose capacity will be 2500 tons daily.

SONORA.

The Greene Consolidated Copper Company reports for the year ended July 31, 1902, that during the past year the installation of a plant and equipment upon the property necessary for the production of 6,000,000 pounds of copper per month has been practically completed. The statement of investments of Cananea shows the total amount expended in the development and equipment of the property to July 31, 1902, to have been \$3,682,072 in the mining division, \$1,471,237 in the reduction dividend and \$1,837,965 in the miscellaneous investments. Upon a con-

siderable portion of the undeveloped area of this ground surface croppings, it is said, indicate the presence of additional ore bodies.

President Greene says that the depreciation in the price of copper from 17 to 11 and 12 cents per pound has retarded the payment of dividends by the company, but the finances of the company are in good condition and dividend payments will soon be resumed. Six smelters are now in operation and the seventh will be put in commission about Dec 10. The converter plant of the company is now completed and has a capacity of producing 8,000,000 pounds of copper per month. Eight main working shafts are now being operated.

The Yaqui S. & R. Co. has a \$150,000 furnace ready to go in at San Antonio de la Huerta, Ures district, where they will establish a reduction and refining plant.

The Chicago & Sonora M. Co., with a gold property near San Antonio de la Huerta, has had built and ready for shipment a 20-stamp mill, air compressor, tramway and other machinery to be set up and put into operation. Wagon roads, pumping plant and pipe line are completed. R. C. Coy of Chicago is president of the company.

NORWAY.

At the close of 1900 there were fourteen groups of mines in Norway, embracing silver and silver ore, gold, copper ore, pyrites (partly cupriferous), nickel ore, cobalt slick, iron ore, zinc ore, chromium ore, mangan ore, molybdenite, rutile, apatite, feldspar. In 1899 these mining industries gave employment to 2457 workmen and produced altogether 162,570 tons of raw material, valued at £255,058. Of this, £217,066 worth was exported, the United Kingdom taking half of it, the next largest quantities going to Germany, Sweden, Russia and Holland. The most important copper mines are those at Roros, yielding by the Bessemer process 95.5% of copper. And at Roros also the most important chromium ores are found. But the Roros mines, the Vice-Consul at Trondhjem states, suffered from a strike last year from March to the close of the year. Thus only about 14,000 tons of ore were extracted, and of this quantity 8000 tons were export pyrites and 600 tons copper ore, yielding 341 tons copper. The Killingdal mines also turned out less, but the prices were good. Next in importance are the Sultelma mines in Salten, Nordland, employing about 700 men and producing annually about 39,000 tons pyrites.

PERU.

From an official pamphlet recently issued by the Peruvian Government it is learned that in that country the mineral code provides that every person can take up as many claims as desired, sixty being the limit. Placer, coal and petroleum claims measure 40,000 square meters. In other cases they consist of a rectangle measuring 200 by 100 meters, or 20,000 square meters. Each claim costs the owner 30 sols per annum, which is equivalent to \$15. The administration of mining affairs is exercised by the Government, with the assistance of a superior counsellor and deputations and delegations situated at the mining centers. Foreigners are entitled to be members of these deputations. Gold is found in sixteen provinces, placers in two, and in almost every river of the eastern region. Besides gold and silver, there are deposits of copper, cinnabar, iron, sulphur, coal, salt and petroleum.

SOUTH AFRICA.

A report of the Chamber of Mines shows that at the close of last June there were employed in the gold mines of the Transvaal 6727 white men and 59,416 negroes. This was an increase of 2359 whites and 10,144 negroes over the number reported January 1. In June about one-third of the milling capacity was employed.

Johannesburg sends word that the revised customs tariff gives general satisfaction. By it the cost of living will be reduced, and the mining and agricultural industries will be materially benefited. The special duty of 6 cents each on poles, 2 cents a pound on sulphuric acid, 6 cents a pound on lead and 12 cents a pound on copper wire have been canceled. All iron will be admitted free, and the cost of building will be greatly reduced by the reduction of the rates on cement and timber. The existing duty on dynamite is left unaltered, owing to the fact that the questions bearing upon the conditions regulating the manufacture and importation of the explosive into the Transvaal colony are under discussion. This duty will be dealt with separately.

The September output of gold from the South African mines was about 175,000 ounces, an increase of 12,000 ounces over the output in August of this year, the largest output for any month since Sep-

tember, 1899, when the output was 411 762 ounces. In October, 1899, owing to the outbreak of the Boer war, the output fell to 19,906 ounces. For the greater part of 1900 and in the early months of 1901 production ceased. Since May of 1901 there has been an almost steady and fairly rapid increase in production.

THE KLONDIKE.

Dawson reports, "The Government has established a test stamp mill here for quartz assays."

"The Ladue M. Co. has bought two-thirds interest in quartz properties near here for \$200,000 and will erect a 100-stamp mill on the property next summer."

Personal.

E. L. TOBIAS is manager Atlantic mill, Empire, Colo.

L. C. DOTY is superintendent Ely M. Co., Ely, Nev.

J. A. PANTING is manager Gold Hill mine, Durkee, Or.

C. I. STEVENS is manager Stevens C. Co., Metcalf, Ariz.

CHAS. WALDEN is manager Last Dollar mine, Victor, Colo.

H. H. CLARK is superintendent Sparks mill, Wedekind, Nevada.

A. V. BOHN, of Leadville, Colo., has returned there from Denver.

J. Y. MCKANE, of Roslyn, B. C., is visiting Tooele, Nevada.

B. F. JAMES has returned to San Francisco from Oaxaca, Mexico.

F. M. DRESCHER has returned from Central City to Denver, Colo.

C. ROCKLIDGE has charge Queen of Sheba mine, Deep Creek, Utah.

R. L. WOOTTON has returned to El Paso, Texas, from Denver, Colo.

D. E. BIGELOW has returned from Calaveras county, Cal., to San Francisco.

J. S. FREE is superintendent G. & S. M. Co.'s properties, Park City, Utah.

W. J. GIRD has returned to Tucson, Arizona, from a mining trip to Mexico.

GEO. BEEBE is general manager Ciene-guita M. Co., Sahuripa, Sonora, Mexico.

L. C. WHITNEY is manager Cripple Creek-Idaho G. M. Co. at Liberty, Colo.

H. B. MAXSON of Reno, Nev., is re-elected secretary National Irrigation Congress.

E. L. BALLOU will return from Pony, Montana, to Igo, Shasta county, Cal., Nov. 1.

C. B. NEEL of Montana has taken charge of the Sumpter, Oregon, smelter now being erected.

MISS MOLLIE O'BRYAN, of Cripple Creek, Colorado, is president the Teutonic G. M. Co.

E. F. STUART, master mechanic Trade Dollar Con. Co., Silver City, Idaho, has resigned.

J. L. WHITNEY has resigned as head timberman Jumper mine, Stent, Tuolumne county, Cal.

JOSEPH D. YOUNG is elected manager of the Silver Cliff G. & C. M. Co., Wallace, Idaho.

E. E. BYRON, manager Summit M. & S. Co., Kokomo, Colo., has returned there from Denver.

W. W. WHITING, Western manager Diamond Rubber Co. of Denver, Colo., is in San Francisco.

W. DOUGLAS, general manager Copper Queen Co., has returned to Bisbee, Arizona, from the East.

E. L. RICKARD is now manager Triumfo M. Co., La Paz, Cal., where he arrived on the 14th ult.

A. G. WEHE, manager Night Hawk mine, has returned to Loomis, Wash., from Milwaukee, Wis.

HERBERT VISSCHER, U. S. Debris Commission, has returned from Butte county, Cal., to San Francisco.

WINTHROP H. WICKHAM, of Denver, Colo., is spending a few weeks at his old home in Norwalk, Ohio.

B. TEAGARDEN, who has been examining California mining property, has returned to Boulder, Colo.

J. E. BEVERIDGE is consulting engineer and assistant to Manager Snyder, Dixie mine, St. George, Utah.

D. E. HELLER is superintendent the new smelter of the Calumet & Arizona M. Co., at Douglas, Arizona.

A. F. CROSSE is now consulting chemist to the East Proprietary Mines, Ltd., Boksburg, South Africa.

F. S. HARRIS, manager La Dorada mine, Sonora, Mexico, is visiting his home in Kansas City, Mo.

C. L. BUCKINGHAM has returned to Denver, Colo., from Ulysses, 45 miles from San Francisco, Idaho, where he is erecting

an amalgamation and concentration mill for the Calumet & Hecla M. Co.

E. T. WOLVERTON is in charge of the Colorado Fuel & Iron Co.'s manganese mine at Little Grand, Utah.

J. S. MURPHY, superintendent Findley mine, Goldfield, Colorado, has returned there from British Columbia.

E. H. BEEBE has succeeded M. Gleason as superintendent Wild Horse mine, U. G. M. Co., Cripple Creek, Colo.

J. J. BROWN of the Little Johnny mine, Leadville, has returned after an eight months' trip through Europe.

O. R. WHITAKER is superintending the mines of the New York & Honduras Co., San Juanito, Honduras, C. A.

W. H. AUBURY has gone to Sandy, Nev., to take charge of the cyanide plant of the Nevada-Keystone M. Co.

J. H. SANBORN, Pacific Coast agent Leyner drill, has returned from Nevada county, Cal., to San Francisco.

J. M. HUMES of Butte has charge of development work in the placers of French gulch, Beaverhead county, Mont.

W. L. SHAFFER will take charge of the Pittsburg Con. M., M. & T. Co., Freeland, Clear Creek county, Colo., Nov. 1.

J. C. O'NEILL, manager Silverton M. Co., Silverton, Colo., has returned there after a month's sojourn in Denver.

C. R. CORNING, of Olcott, Corning & Peale, New York, N. Y., has been examining mining property at Ely, Nevada.

E. R. TUFTS, general manager Sinaloa-Sonora M. & S. Co., has returned from New York to Alamos, Sonora, Mexico.

W. J. PARKER, general manager Urique G. M. Co., Urique, Chihuahua, Mexico, has returned there from San Francisco.

LEWIS SEARING, general manager Denver Engineering Works Co., has returned to Denver after an extended visit through the East.

J. R. CHAPTON, of Los Angeles, Cal., has been making examination of the Cripple Creek Con. M. & T. Co., French gulch, Colo.

GEO. L. WALKER of the San Francisco branch American Steel & Wire Co. is expected to return to California from the East next week.

A. B. FRENZEL, who has been in Europe making experimental tests on vanadium and uranium ores, has returned to Telluride, Colo.

THOS. RICKARD, vice-president of the firm of Harron, Rickard & McCone, San Francisco, leaves to-day for a six-weeks Eastern sojourn.

R. N. DICKMAN, of Dickman, Mackenzie & Potter, mining engineers, of Chicago, is in Joplin examining lead and zinc mining properties.

JAMES SKEAFF, manager Mohawk M. Co., Prescott, Arizona, is visiting Angels, Cal., where he engaged J. Davis as foreman Mohawk properties.

JOHN KISSICK has resigned as foreman at the Highland mine, Deadwood, S. D., and is succeeded by T. J. Danielson, former foreman at the Homestake.

M. ELLIOTT, a former California mining superintendent, returned last week to Johannesburg, South Africa, where he will resume charge of a mine.

JOHN K. MACKENZIE, of Dickman, Mackenzie & Potter, mining engineers, of Chicago, is at Gilt Edge, Montana, looking over the Gilt Edge mine.

J. D. SWORD and W. H. YOUNG have returned to San Francisco from Mexico, where they examined mining property at Copala, 65 miles from Mazatlan.

E. H. LUNKEN, of Denver, Colo., president Lunkenheimer Co., is spending a few weeks in Cincinnati, Ohio, looking after the interests of the Lunkenheimer Co.

HANS C. BEHR has been awarded a gold medal and 40 guineas by the Consolidated Gold Fields of South Africa, for his article on "Winding Plants for Great Depths."

H. E. HUNTINGTON, of the Southern Pacific Co., and H. T. Scott, of the Union Iron Works of San Francisco, are elected directors Greene Consolidated Copper Co.

W. E. ELLIS, formerly superintendent the Colorado Zinc Co., at Denver, Colo., has resigned his position and is now looking after some mining interests near Salmon City, Idaho.

A. HOULE, manager Gold S. M. Co., Wallace, Idaho, is in San Francisco to get a hydraulic elevator. He goes thence to New York City, returning to the Idaho property next spring.

C. W. VAN LAW, who for three years has been with the Smuggler-Union Co., San Miguel county, Colo., as superintendent of mill construction, has resigned to enter the employ of the Allis-Chalmers Co., Chicago.

W. THOMPSON, consulting engineer Slough Creek, Ltd., has returned from

British Columbia to London. He spent three months at the Cariboo Gold Fields mine and the properties of the Cariboo Consolidated.

F. L. BROWN, formerly manager San Francisco branch Washburn-Moen Co., before its absorption by the American Steel & Wire Co., has returned to San Francisco from New York City, with a view to engaging in business.

H. A. SHIPMAN, formerly general manager Stratton's Independence, S. Loeb, former superintendent, and G. Gill, one of the contractors on the property, sail for London next Monday for South Australia, where they have secured positions.

S. A. PARNALL says he is not to take the superintendency of the Trimountain at Houghton, Mich., as previously arranged, but will go to another property in Mexico, 200 miles south of El Paso. This leaves Captain Chynoweth still in charge of the Trimountain.

E. MCGINNIS, formerly superintendent Druid G. M. Co.'s property, Hinsdale county, Colo., is in Shasta county, Cal., examining mines for the Coates family, Paisley, Scotland, and is succeeded by J. Anderson, who will have charge of the work at the Colorado property.

T. J. GRIER, superintendent Homestake M. Co., South Dakota, has returned from a visit to the Alaska-Treadwell mine, Douglas Island, Alaska. He says the company is dropping 830 1000-pound stamps and crushing on an average 5000 tons of ore a day. The stamps drop ninety-eight times a minute in a low-issue mortar with 20-mesh screen, the capacity per stamp being 5.6 tons. At the Homestake in Lead 900 stamps weighing 900 pounds each drop 86 to 88 times a minute, and using 35-mesh screen, making four tons per day to the stamp. Water is employed for three-fourths of the power at the Treadwell and steam for one-fourth. Sixty per cent of the ore comes from the open-cut and 40% from underground.

Commercial Paragraphs.

R. W. HUNT & Co.'s offices are now located at 1121 Rookery Bldg., Chicago, their laboratories still being on the twelfth floor of that building.

DICKMAN, MACKENZIE & POTTER, mining engineers and assayers of Chicago, have changed their office to 1120 Rookery Bldg., Chicago. The laboratories of the company have been much enlarged lately and new appliances have been placed therein.

A. J. McCONE of Harron, Rickard & McCone has bought the Nevada Foundry and machine shops, Reno, Nev., and will increase the size and capacity of the plant. A hoiler shop will be one of the additions to the place. It is locally reported that the McCone works at Virginia will be moved to Reno to be incorporated with the plant there.

THE Mine & Smelter Supply Co., Denver, Colo., are in receipt of the following orders: Thirty-six Willey tables for Montana Ore Purchasing Co., Butte, Mont.; seven Willey tables for Daly Judge mill at Park City, Utah; and recently expressed on an order from their El Paso house six Durkee drill plants complete to the El Paso & Northeastern Ry. They have also shipped forty-one water jackets for furnaces to Cananea Copper Co., La Cananea, Mexico.

McFARLANE & Co., of Denver, Colo., have orders for the following: One Ajax drill sharpening machine for the Center Star M. Co., Ltd., Roseland, B. C.; one Ajax drill sharpening machine for Bunker Hill & Sullivan M. Co., Kellogg, Idaho; one Ajax drill sharpening machine for Wm. A. Clark, Butte, Montana; one 9x15 crusher for A. Y. & Minnie mine, Leadville, Colo.; one fuel oil heater, 20 feet long, 6 feet diameter, and twelve side dump ore cars, 54x66 inches, for Portland Cement Co.

THE Llewellyn Iron Works of Los Angeles, Cal., has the contract for the new 500-ton concentrator for the Shannon Copper Co., Clifton, Ariz. The plant will be on the hillside above the smelter, to which the ore will be elevated after passing through the crushers. The building enclosing the plant will be of steel and iron. The work of construction will be rushed and it is expected the plant will be in operation Feb. 1, 1903. Briquette machinery will be installed at the smelter and will be ready when the plant starts up.

THE J. H. Montgomery Machinery Co. of Denver, Colo., report an increase in their export business for the last year. Among their recent foreign shipments are large orders of mining machinery to Chile and Peru, South America, and a consignment of Common Sense steel whips to South Africa. Their business with Mexico has more than doubled in the past year, and recent shipments to that country include a 50-ton copper smelter and three

carloads of ore cars and ore buckets. The Stanley G. M. Co. of Idaho have pay ore in shipping quantities and will begin operations on an extensive scale; they have ordered a mining plant complete from the J. H. Montgomery Machinery Co., including a 60 H. P. engine, hoiler, cars, ore buckets, track, etc.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING OCTOBER 7, 1902.

710,400.—COAT AND HAT LOCK—G. E. Allen, S. F.
710,338.—SAWING APPARATUS—J. A. Brines, Fresno, Cal.
710,321.—HOOK AND EYE—Dora S. Daily, S. F.
710,912.—FISH CLEANING MACHINE—A. J. Farmer, S. F.
710,655.—GARMENT SUPPORTER—F. Ferguson, Santa Rosa, Cal.
710,682.—MOTOR LOCK—G. S. and A. G. Guenther, Los Angeles, Cal.
710,663.—FASTENER—A. Haug, S. F.
710,689.—MASSAGE MACHINE—W. W. M. Hickey, S. F.
710,690.—GOLD SEPARATOR—W. W. M. Hickey, S. F.
710,580.—FUEL—C. J. Holmes, S. F.
710,462.—SETTLING TANK—R. D. Jackson, Reno, Nev.
710,859.—RAISING WRECKERS—Johnson & Jacobson, Chicago, Wash.
710,700.—BORING TOOL—J. Lund, S. F.
710,501.—CARRIAGE POLE AND NECK YOKE—M. McNutt, S. F.
710,599.—FOUNTAIN PEN—J. P. Murdock, San Diego, Cal.
710,897.—QUICKSILVER FURNACE—R. Scott, San Jose, Cal.
710,719.—WRENCH—J. J. Seeman, Barstow, Cal.
710,898.—OIL BURNER—E. J. Sharp, Alhambra, Cal.
710,899.—OIL BURNER—C. W. Sievert, Los Angeles, Cal.
710,900.—LAWN RAKE—F. A. Smith, Los Angeles, Cal.
710,732.—PADLOCK—H. A. Smith, Los Angeles, Cal.
710,813.—CONVEYOR—J. W. Stancart, S. F.
710,814.—ADVERTISING DEVICE—E. Steinhauser, Waterville, Cal.
710,903.—LID CONTROLLER—L. J. Sticklin, Chehalis, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MASSAGING MACHINE.—No. 710,689. Oct. 7, 1902. Dr. White Wolf, San Francisco, Cal. This apparatus is especially designed for carrying out the various operations of massaging and manipulating the various parts of the body of the patient. It consists of a framework carrying shafts having eccentric members, said shafts journaled across the framework; pulleys are mounted upon the shafts and belts from which motion is transmitted to rotate them. There are connecting rods having flexible joints and handles and belt attachments whereby the movement of the said eccentric members is transmitted to the body, and means for varying the length of the stroke of the eccentric members.

GOLD SEPARATORS.—No. 710,690. Oct. 7, 1902. Dr. White Wolf, San Francisco, Cal. This invention is designed for the separating of gold from sand and other material with which it may be associated, and means for saving and retaining the gold. It consists in a novel arrangement of suspended oscillating sluices and riffles, a means for supplying water and material and distributing the same over the surfaces, means for arresting the gold and separating it from the sand and discharging the sand from the apparatus.

COAT AND HAT LOCK.—No. 710,400. Oct. 7, 1902. G. E. Allen, San Francisco, Cal. The object of this invention is to furnish a simple form of lock that can be carried in one's pocket and which is quickly engaged and disengaged with a hat or coat, and which can be easily secured to a hook, nail, ring, or the like. It consists of two arms, one of which is movable in relation to the other, said arms adapted at one end to receive and retain a fabric, the other end of the fixed arm carrying jaw members which are adapted to inclose a hook or nail, one of said jaws movable and adapted when open to allow the arms to open and when closed to prevent the arms being opened, and a pawl and ratchet mechanism whereby the said jaws are locked.

GARMENT SUPPORTERS.—No. 710,675. Oct. 7, 1902. F. Ferguson, Santa Rosa, Cal. The object of this invention is to provide a drawers supporter which may be quickly attached to or detached from the suspender, is adjustable to various necessary lengths and which is adapted to take layers of cloth of any weight or thickness. It consists of flexible grip members adapted to engage the garment to be supported, said members comprising an elastic sided yoke or holder, one of which is slidable and retained in a cylindrical extension of the other side, a stud or button having a resilient covering of rubber, felt, or the like, said button adapted to be engaged by an elastic loop, and means by which these grip members may be attached to a suspender or the like.

FISH SPLITTING AND CLEANING MACHINE.—No. 710,912. Oct. 7, 1902. A. J. Farmer, San Francisco, Cal. Two-thirds assigned to J. P. Haller and C. P. Hale of same place. This apparatus is designed to split and clean fish. It consists of a series of rollers having teeth or spikes adapted to engage and carry the fish, means by which said rollers are adjustable for fish of different sizes, mountings for the rollers by which the first rollers encountered by the entering fish present approximately vertical gripping surfaces, and these are gradually inclined until at the discharge the surfaces of the rollers are presented downwardly, so as to flatten out the fish for drying or similar purposes. Intermediate between the rollers is a splitting and gradually spreading device by which the fish is opened out in unison with the gradually changing faces of the pressure rollers and mechanism in conjunction therewith by which the entrails are cleaned out during the progress of the fish through the apparatus.

Latest Market Reports.

SAN FRANCISCO, Oct. 17, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 50½c, refined (1000 fine); San Francisco, 50½c; Mexican dollars, 44½c San Francisco, 41½c New York.

COPPER.—New York: Standard, \$10.65@11.00; Lake, 1 to 3 casks, \$11.55; carload lots, \$11.15; Electrolytic, 1 to 3 casks, \$11.45; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.40; carload lots, \$11.25. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £52 spot per ton.

The figures of domestic production for the month of September show 25,788 tons, against 21,580 tons in 1901. The production for the nine months of the current year was also in excess of the corresponding period last year, the figures being 218,281 tons, compared with 199,626 tons.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 13s 9d per ton.

SPELTER.—New York, \$5.50; St. Louis, \$4.50; London, £19 5s 0d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$25.50; San Francisco, ton lots, 28c; 1000 lbs., 29c; 500 lbs., 29½c; 200 lbs., 29½c; less, 30c; bar tin, 3½c. London, £116 10s spot.

PLATINUM.—San Francisco, crude, \$18.00 ½ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 ½ flask of 76½ lbs.; Denver, \$49.65. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90c, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

NICKEL.—New York, 50@60c ½ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22 50; gray forge, \$20.00; San Francisco, bar, 3c ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31 and \$31.50; open hearth billets, \$32 and \$32 50; San Francisco, bar, 7c to 12c per lb.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c ½ set; 14oz., 40s., 9½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8; Seattle, \$6.50; Coos Bay, \$6.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$7.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8 50, long ton.

CHEMICALS.—Cyanide of potassium, 98½-99%, johning, 27@28c ½ lb.; carloads, 25@26c; in 10-lb. tins, 35c; sulphuric acid, in carboys, 66½ B, 2c ½ lb.; soda ash, \$2.00 ½ 100 lbs.; hyposulphite of soda, 2½@3c ½ lb.; blue vitriol, 5½@6½c ½ lb.; horax, concentrated, 7@8c ½ lb.; chlorate of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3½@3¾c; California refined, 2@2½c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3@4c ½ lb.; Cal. s. soda, hbls., \$1.25 @1.50 ½ 100 lbs.; sks, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in hbls, 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c ½ lb.

OILS.—Linsed, boiled, hhl., 57c; cs., 62c; raw, hbl., 55c; cs., 60c; lots of 5 hbls., 10 less; Lucol oil, hbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron hbls., 19c; wooden hbls., 22½c; cs., 25c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, hulk, 17c; do., cs., 23½c; 86° Gasoline, hulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., 95c; cs., \$1.05; Neatsfoot Oil, hbl., 70c; cs., 75c; No. 1 hbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ½c per lb. above kegs price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above kegs price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Sunbtrate, per lb., \$1.60.

BONE ASH.—4c ½ lb.

BORAX.—Crystall, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 60c.

MANGANESE.—(90% and over) ½ lb., \$1.25.

MERCURY.—Bichloride, ½ lb., 90c.

MOLYBDENUM.—25c. ½ gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) ½ lb., 80c.

SILVER.—Chloride, ½ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ½ lb., \$1.00.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c.

ZINC.—Dust, ½ lb., 10c.

ZINC.—Sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

THE CALIFORNIA DEBRIS COMMISSION,

having received applications to mine by hydraulic process from J. E. Jones, in Jones' mine, near Bulards Bar, Yuba County, Cal., draining into Oregon Creek which reaches Yuba River; and from J. F. Covery, in Browns Flat Mine, near St. Louis, Sierra County, Cal., draining into State Creek which reaches Yuba River; gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., Nov. 3, 1902, at 1:30 P. M.

A GOLD MINE FOR SALE.

Over \$100,000 worth of ore in sight. Water power, machinery and 20-stamp mill on the premises.

Platinum Geologically Considered.

"The Geological Relations and Distribution of Platinum and Associated Metals" is the title of Bulletin No. 193 of the U. S. Geological Survey, by J. F. Kemp. The work is a notice and discussion of the various places throughout the world where platinum has been reported, with such evidence as would tend to give the report credence, with a careful summing up of the whole matter and a presentation of what is now most clearly known regarding the economic geology connected with this important metal.

It is here to be noted how persistently error perpetuates itself, even in U. S. government reports. Mr. Kemp is excellent authority and usually most reliable, but he admits as authentic an alleged discovery of platinum in the copper ores of the Rambler mine, 50 miles southwest of Laramie, Wyoming. At the time of the stated find two samples were sent to this office and accurate analysis failed to show a particle of platinum. That platinum was so contained was widely announced at the time, but the fact of its non-existence there now appears to be substantiated.

The concluding pages of the work give some practical points to the practical miner, wherein the author indicates that in placers the platinum has been mostly derived from peridotites, and in less degree from pyroxenites, gabbros and syenites. Regarding the latter, he says that geologists have long appreciated the importance of the peridotites, but have not generally realized that, in a minor degree, the syenites are also of wide distribution and that they likewise deserve emphasis. Thus, for example, they are recorded in the Urals, in Colombia, Brazil and British Columbia.

Quoting the author's words at length, he notes that platinum or palladium has been observed in veins in connection with gold at Tilkerode in the Hartz; in Minas Geraes in Brazil; at Santa Rosa in Colombia, and at Beresovsk, Russia. Whether the platinum or palladium is or is not associated in these localities with other metallic sulphides does not appear from the incomplete records.

Platinum as a subordinate component in complex antimonial sulphides of copper and other metals occurs in veins at Guadalcanal, Spain, and probably also in veins in the Val du Drac and elsewhere in eastern France. While this association is as yet only

of mineralogical interest, it nevertheless shows that platinum can occur in this way, and makes it desirable that similar ores be tested where found.

Where platinum is disseminated in eruptive rocks it occurs in two forms. The first is the arsenide, sperrylite, associated with copper-nickel ores in uraltized norites, at Sudbury, Canada. In the second form the platinum in the native state is contained in basic eruptives, more especially peridotites. The platinum is frequently involved in a very intimate way with chromite. In the most natural interpretation of the phenomena the two minerals are regarded as having crystallized in the normal passage of the fused magma to the solidified condition. It should be clearly stated, however, that two views have long prevailed regarding chromite. Its deposits which are large enough to mine are so uniformly in serpentine, and are so often of such great extent, that the chromite has been believed by some to be a product of metamorphism. Its masses are supposed to be segregations which have resulted from the change of anhydrous chromium bearing silicates to the hydrated form, with attendant separation of chromic oxide.

On the other hand, chromite has been looked upon as a true igneous mineral; it has been discovered in basic eruptives, not in the least changed to serpentine, and it has, therefore, been believed to be, even when in serpentine, an unaltered survivor from a previous anhydrous magnesian eruptive.

In the case in which platinum has been discovered in quantity in the country rock (on Mount Soloviev, Nijni-Tagilsk district) it has been associated with an altered and serpentinized or even carbonated form

of peridotite. It is fair to raise the question whether the presence of the platinum is in any way connected with this excessive alteration, or whether the change has happened to take place where the platinum was previously abundant. In the Tulameen district, British Columbia, Mr. Kemp found platinum in serpentinized belts along dislocations, but many belts have also been tested which gave no platinum. In these occurrences the platinum is so excessively fine that evidence is not easily attainable as to its relations to the mother rock. In the present state of our knowledge it might be possible to develop an argument, not easy to refute, that the platinum in these surroundings had entered in solution or had been deposited in connection with the secondary changes; and yet from a study of many nuggets, and from very careful and detailed observation of the peridotite on the Tula-

Precipitating Room, Horseshoe Gold Mining Co., Fay, Nevada. (See Page 237.)

meen, it is his belief that the platinum is, in far the greater part, a true igneous mineral. This belief rests upon the following grounds: First—Some nuggets contain the platinum associated with perfectly fresh olivine, and the relations are precisely those of two minerals which have crystallized from fusion and of which platinum is the older. Had there been any secondary introduction of platinum, so sensitive a mineral as olivine would have shown some signs of change. Second—The platinum and chromite can be satisfactorily explained, as regards their relations, on the basis that the chromite is a slightly older mineral, which has become involved in and with the platinum, and that the latter has crystallized a little later. That the period of the much more abundant chromite has lasted into that of the rarer platinum, or even longer than it, is quite possible, because of the influence of the principle of solution. Chromite is more infusible than native platinum. No mineral in a fused magma can crystallize out at a temperature above its fusing point.

LATEST MARKET REPORTS.—246.

MISCELLANEOUS.—Platinum Geologically Considered, 231. Concentrates, 233. Electricity in Mine Operations, 234-235. The Cumaral Property in Sonora, Mexico; The History of a Catalogue, 236. The Traveling Salesman; Details of Cyaniding, 237. Robins Belt Conveyors as Tailings Stackers, 238. Mining and Metallurgical Patents, 239-240. Personal; Commercial Paragraphs; Obituary; Catalogues Received; Notices of Recent Patents; New Patents; Mineral Statistics for 1901; What the California Miners' Association Has Done—1892 to 1902, 245-246.

To ILLUSTRATE the difficulties and delays that beset the path of the inventor may be mentioned that it is only within the last few months have been issued two United States patents that were applied for in 1885 and 1887. They both related to the distribution of alternating currents of electricity by means of transformers. To "hold up" a patent for seventeen years is somewhat unusual, even in the U. S. Patent Office, the cause in these two cases being a legal contest in the Patent Office between rival claimants to priority of invention.

WHILE authenticated accounts of extraordinarily low costs of mining and milling gold ore have been repeatedly published herein, such facts are to be considered somewhat phenomenal; that is, there is something in each of such cases specially favoring unusually low totals of cost. The fact that such totals at the Spanish mine, Nevada county, Cal., were 80 cents per ton, or at the Alaska-Treadwell mine are \$1.31 per ton, does not make it logically follow that gold ore anywhere can or ought to be mined and milled for such a low figure.

CONTRADICTION of trade conditions make necessary the importation of structural material to this country from Europe. Despite the great output of United States manufactures, Western progress is retarded by inability to secure material. A case in point is afforded by the new Denver, Northwestern & Pacific Railway, which has been obliged to order 50,000 tons steel rails from Antwerp. This Denver-Salt Lake road in turn asked rails from the Colorado Fuel & Iron Co., then from Pittsburg, and lastly from the Illinois Steel Co., only to be told that it was impossible to furnish them. Then the European order followed. The Southern Pacific Railway Co. has been obliged to do the same thing. The Antwerp firm guarantees to furnish the rails at a price that, with the import duty added, totals a little under the quotations of the American steel rail makers. It is not a complimentary comment on Pacific coast progress to note the great iron deposits this side of the Sierras, the present low price of fuel oil, the great and growing demand for iron and steel, and yet the placing of an order for rails in Belgium.

CONSIDERABLE is being said and sung, and with great show of justice regarding the man who has a mining claim and who only does just enough of work on it to hold it. It is pointed out that whatever wealth is in it must be developed, and that he is only a dog in the manger if he doesn't either work it or let some one else do it. And yet, after all, it is his property, just as much as is a valuable street-corner lot the property of some one who holds it unimproved and unproductive, each alike, having to pay the penalty of taxation on such unproductiveness. A man has a

right to pay high taxes on a city lot or to do annual assessment work on a mining claim just as long as he wants to. It isn't business, but that doesn't affect his rights in the matter. In the case of the miner the chief silliness is holding on to the claim in hopes of getting a big price for the prospect when any one can come in and make as good a location for \$200 as the other wants \$10,000 for. Usually when the man who is holding on finds that he can't get the \$10,000 or \$50,000, he says some one "knocked" the deal, when it is his own inability to see the facts as they really are.

WHERE it is not easy to find an elevated site for a reservoir for water supply, it is common to erect trestles and surmount them with steel tanks, or else to use the cylindrical metal reservoir known as a standpipe. Standpipes are by far the most common form of metallic reservoirs, but steel tanks supported at the requisite height on steel trestles are now very often preferred as a cheaper and safer way of supporting the effective upper column of water, 20 to 30 feet high, than by a column of water below inclosed in a cylinder. Standpipes vary, for the most part, from 50 to 120 feet in height, and from 11 to 39 feet in diameter, being exposed to maximum pressures of 82 to 130 pounds; while their average dimensions and pressures are, 63 feet high, 20 feet diameter, with a capacity of 150,000 gallons, an ordinary pressure in the distributing of 62 pounds per square inch. The tanks on the average have a height of 37 feet, a diameter of 21½ feet, a capacity of 100,000 gallons, and an elevation on a trestle or tower of 63½ feet. To obtain the average pressure of 62 pounds, the effective height of the standpipe or tank would require 142 feet, but generally advantage can be taken of some natural elevation in the neighborhood to reduce the actual height of the standpipe or tank.

THE acceptance of the proposed arbitration by the anthracite coal miners, at the Wilkesbarre, Pa., convention on the 21st, was followed by a general resumption of work in the collieries on the 23rd, and after two weeks it is expected that there will be the usual output and shipment of coal. President Roosevelt met the arbitration commission that he had selected at Washington, D. C., yesterday morning, and next week they will begin their deliberations. These men have a very difficult task. They will meet at various places as may suit the common convenience, take testimony of coal miners, and coal mine owners, and after due consideration of the evidence so presented will prepare a report to be submitted to President Roosevelt. All this will take considerable time. The first step and the most important and satisfactory one has been made, viz.: to secure consent of both sides to arbitration. It is now the interest of all—miners, owners and the general public—that the arbitration shall be a success, and it will probably be such, brought about by some concessions by and from both owners and employees. The outcome is the best that under circumstances could be looked for, and if the professional agitators and mischief makers can be ignored, the final result can be that the industrial disagreement of 1902 may merely pass into history as a great strike settled by the exercise of common sense.

COMPLAINT is made in some technical and trade journals, notably those devoted to electricity, that the present prosperity has a bad effect on the advance of the art, as every factory is so busy filling orders as to leave no time for experiment or improvement. It is argued by those who allege the cessation of electrical development that this is an evil attendant upon the present rush of business and that our European neighbors will devote their enforced leisure to improvements and developments that will eventually put them in the lead. There is a slight thread of truth in the assertion, but the American manufacturer in any line of applied science, whether electricity, mining or metallurgy, is scopy enough to fill the demand and at the same time keep up experimentation. With this it is just about as with a mine manager: no real manager will be content with extracting ore; he wants to do "dead work" or development work; he wants to explore as well as exploit, and constantly seek new ore bodies before those he now has are worked out. So with the manufacturer, who, while busy with orders, realizes, no matter how excellent the present standard

types of apparatus, that there is a constant advance in engineering, and that he must keep up experimenting with new ideas, new systems and new apparatus, that when the present is out of date he may not be out of business, but be able to keep up with the procession.

THE eleventh annual session of the California Miners' Association will be held in San Francisco November 17, 18, 19. The executive committee considers it wise to have the by-laws so amended that any member in good standing may consider himself a delegate and take part with voice and vote in the proceedings. It is also intended at the coming convention and future meetings that a part of the proceedings shall be the reading of articles by practical miners on practical mining subjects. It is thought that this will be of considerable interest and value, and that the resultant discussion will be of general aid. It is the common experience of every one who has ever taken part, that the discussion brought out by the reading of such a paper is often more interesting than the paper itself; hearing the ideas of one starts thought resulting in dissent or approval or additional data, to the end that there is augmentation of the common stock of knowledge on that subject. A case in point is illustrated by the excerpt on pages 234 and 235 from the proceedings of the recent San Francisco convention of the Pacific Coast Electrical Transmission Association. The reading of a paper on electricity as applied to mining brought out the discussion published in full on those pages, and certainly any one interested in the subject in any way will say that after reading the discussion he has had his stock of knowledge on that subject increased. This is just the idea regarding papers and articles for the ensuing miners' meeting; short, practical articles on practical subjects connected therewith and discussion thereof, the papers and the discussion by the men who do the things they write and talk about. In that way considerable valuable information can be secured, and the idea is commended to favorable attention. The California Miners' Association has done a great deal; much remains to be done; it deserves commendation for all it has done and tried to do, and deserves encouragement and co-operation in future work.

In the current installment of the "History of a Catalogue" on page 236 (which is being read by every mining machinery man in the country) the concluding sentence says an exceptionally good thing in the statement that "good business is in its greatest success for the largest good of all concerned." This is well said. No calling requires a greater use of brain power than business, and few require a higher order of general ability. The great secret of success in business—the secret, in fact, of success on a large scale—is to conceive of it as a matter of principles, not merely as a series of transactions. There are great merchants as there are great statesmen, and there are small merchants as there are small politicians, and the difference between the great and small men is much the same in both. The small politician works by the day, and sees only one opportunity before him; the small merchant does the same thing—he is looking for the next dollar. The statesman, on the other hand, is master of the situation, because he understands the general principles which control events. This knowledge enables him to deal with large questions and to shape the future. The great merchant does the same thing. His business is not a mere money-getting affair, not a mere matter of barter, but a science and an art. He studies the general laws of trade, watches the general condition of the country, investigates present needs, foresees future wants and adapts his business to the broad conditions of his time and place. He puts as much brains into his work as does the statesman, and he ends by being not a money-getter, but a large-minded and capable man. The more one understands life the more clearly he will see that it is all done on business principles, by which is meant that not only the universe is governed by unvarying laws, but that promptness, exactness, thoroughness and honesty are wrought in every fiber. On these business principles all life is conducted—if not by man, at least by that power which is behind man. It ought to be the ambition of every young man to treat his business from the point of view of the statesman, and not from that of the politician.

Concentrates.

THE duty on imported quicksilver is 7 cents per pound.

ABOUT 63% of the world's supply of gold has been taken from placer ground.

THE world's quicksilver production in 1901 was about 3331 metric tons—96,932 flasks.

A CORPORATION, a citizen, a woman or a minor may each make a valid mining location.

AT 5000 feet altitude an air compressor should be about 25% larger than at sea level.

A GALLON of refined petroleum weighs 6½ pounds; a gallon of crude petroleum about 7½ pounds.

ON steam vessels all boilers must be equipped with fusible plugs, made of brass and filled with Banca metal.

IN the Ural district, Russia, for 1901 was produced gold, 570 poods (2052 pounds); platinum, 380 poods (1368 pounds).

A CIRCULAR MIL is a circle 1000 inch in diameter. A wire 1 foot long and 1 circular mil cross-section is called a mil-foot.

WOOD can well be used for fuel in a reverberatory furnace, a deep firebox being required—from 12 to 16 feet length of hearth.

THE chief difference between granite and syenite is that the latter has scarcely any quartz and not usually more than 50% silica.

ASBESTOS is ordinarily found in serpentine. Geologically speaking, serpentine is decomposed granular intrusive rock, either peridotite or pyroxene.

FOR operating air drills, and for other ordinary mining purposes except ventilation, the working pressure is usually from 60 to 80 pounds per square inch.

THE addition of 8½ f. drachms, or 33 grams by weight of water, to each 500 grams crystallized carbonic acid will render it permanently liquid and ready for use.

WATER expands one-twelfth of its bulk in freezing, exerting a pressure of 30,000 pounds per square inch. Air is 813.67 times lighter than water at sea level.

ABOUT 100 miners' inches would be needed to run a hydraulic elevator with a 2-inch nozzle and a 150-foot head. That would be about 2½ cubic feet per second.

COBALTINE is found near Cisco, Placer county, Cal., a silvery white mineral with reddish tinge, occurring as impregnation in a mica schist, near the granite contact.

By zinc precipitation cyanidizers have calculated that one pound of zinc is consumed for each ounce of gold. Where charcoal is used the solution is constantly pure and clean.

THE deepest mine shaft in the United States is the Calumet & Hecla—4900 feet. The deepest hole drilled in the United States is the oil well of the Forest Oil Co., West Elizabeth, Allegheny county, Pa.—5575 feet.

MICA possesses the highest insulation resistance and the largest dielectric strength to be found. It requires 1000 volts to perforate a sheet 1 mil in thickness. Its chemical constitution is unaffected by high temperatures.

AN approximate way to determine the horse-power necessary to pump water to a given height is to multiply the total weight of water in pounds by the height in feet and divide by 16,500. This allows for water friction and steam loss.

BUTTE, MONTANA, copper mines at a depth of 1800 feet show a maximum temperature of 72° F.; Lake Superior copper mines at that depth, 50° F. "Concentrates" does not know of any Arizona copper mines attaining that depth.

THE Canadian Government pays a bounty of \$2.70 per ton on iron and steel manufactured in the Dominion from native ore and \$1.80 per ton from foreign ores, the bounties lessening each year. Last year those bounties amounted to \$351,259.

IF A asks B to sell goods to C on credit, A telling B that he (A) would pay for such goods if C didn't, A is not legally liable. Any actionable agreement would have to be in the shape of a suretyship, and in writing, properly signed and attested.

A pipe inserted in the top of a stack, leaving an annular space of 3 inches between itself and the inside of the stack, extending about 8 feet down into the stack and projecting 7 feet above it, is said to be an excellent and cheap device for preventing smoke and a saver of 10% of fuel.

WERE air exhausted from above the surface of the water the temperature could be raised to 275° F. before vaporization took place. When it did, the action would not be like ordinary ebullition under pressure of the atmosphere, but would be an instantaneous explosive.

IN electrolytic parting of gold and silver the alloy of the two metals constitutes the anode, and is placed in a linen bag. The cathode is a thin sheet of pure silver. The electrolyte is at first a 1% solution of nitric acid, which ultimately becomes a dilute solution of silver nitrate. With a current density of thirty-three amperes per foot, silver 99.5 per mil fine is deposited on the cathode in the form of crystals. These are mechanically scraped off and allowed to drop to the bottom of the cell.

Gold in the form of mud, containing some silver, collects in the anode bags. The silver is removed from it by dissolving in nitric acid, leaving the gold in a pure condition.

AN alloy that looks very much like gold can be made of copper 94 parts, antimony 6 parts, the latter added after the copper is melted; subsequently sufficient magnesium, carbonate and calcium can be added to make it weigh about the same as gold. The alloy can be hammered, soldered, and is practically unaffected by nitric acid.

THE assay-ton system of weights was devised by C. F. Chandler, of Columbia College. As there are 29,166.6 Troy ounces in one ton avoirdupois—2000 pounds—the assay ton contains 29,166.6 grams. Hence, if one assay ton of ore is taken for assay and the resulting button weighs ten milligrams, the assay value of the ore is ten ounces per ton.

THERE are frequent requests for back numbers of this paper published in the '70s, '80s and '90s. The charge for such copies is 5 cents each in addition to the regular 10 cents charged for the current issue, for each year back. For instance, a copy is wanted say of the issue of July 9, 1893. It would cost 30 cents. A copy of the issue of April 21, 1894, would cost 50 cents, and so on.

DISTILLATE OIL carries 2% asphaltum and 98% liquid. Crude oil carries 45% asphaltum and 55% liquid; about the same as if one bought soft coal—some of it is dust which will not burn, but will fall through into the ash-box. It is the same with crude oil—the asphaltum will not burn, only makes smoke. The law requires that upon steamships no higher gravity be used than 16-18.

"TECHNICAL TERMS" are used herein as little as possible, but can not be wholly dispensed with. A "technical term" that may have no meaning to one conveys exact information and expression to another and is unavoidable in any article treating on any special subject. A "technical term" is synonymous with an exact term, a word or phrase specially or exclusively pertaining to some particular trade, profession or pursuit, and one that could not be exactly replaced by any other.

FOR coating aluminum with other metals use the following electrolytic solutions: For silver, 20 grams of nitrate of silver, 40 grams of cyanide of potassium, 40 grams of phosphate of soda, 1000 grams of water; copper, 300 grams cyanide of copper, 450 grams cyanide of potassium, 450 grams phosphate of soda, 5000 grams of water; nickel, 70 grams phosphate of soda, 70 grams chloride of nickel, 1000 grams of water. The anodes are of the same metal as that in solution, and the bath is kept at 140° to 158° F.

ONE cubic foot of air compressed adiabatically from 14.7 pounds per square inch (60° F.) to 74.7 pounds absolute results in a temperature of about 365° F., and the mass of air will occupy .314 cubic foot. It may be stated generally that for pressure above 70 to 80 pounds per square inch it is advisable to compress in two stages—that is, the air at atmospheric pressure is drawn in and compressed to an intermediate pressure in the first cylinder, and from this it passes to the second cylinder, where it is compressed to the final or working pressure.

GALENITE and other lead ores are the source of much silver, which alloys with the metallic lead after roasting. Pattinson's process for the separation of the two metals depends upon their difference in crystallizing. Just before the molten alloy solidifies, crystals of almost pure lead occur in the mixture. These are dipped out by means of a sieve-like ladle. By the repetition of this, almost all the lead is removed, leaving a rich silver product. This is heated in appropriate vessels in contact with the air, when the remaining lead is oxidized, leaving metallic silver.

IN a 5-stamp battery each 1350-pound stamp dropping 100 times per minute would require 2½ H. P.; each 900-pound stamp at the same drop rate, 2 H. P.; each 750-pound stamp, 1½ H. P. Boiler feed for each horse power per hour would average five gallons water. 1, 5, 2, 4, 3 is good drop arrangement, No. 1 sending the water through the battery lengthwise, which No. 5 in falling catches and throws back, the same with No. 2, sending it back to No. 4 in its descent, No. 3 equalizing the swash. 3, 5, 1, 4, 2 is the succession most frequently adopted in California.

FRAUDULENT and BLACKMAILING SCHEMES of Eastern "investment," "financial" and "mining" journals have been exposed enough to place people on their guard, and in a paper like this such exposure needs no repetition, as our readers are not of a class liable to be bunked by those sharpers. No inconsiderable part of the mail received in this office is letters asking the opinion of the editor as to the worth or unworth of certain statements, letters sometimes prompted by the swindlers themselves in hopes of securing notoriety by suits for libel against this paper.

PROSPECTS have often been developed into mines by miners who have operated on the claims under lease, the work being done by men who have made a life study of it and who know more about the practical side of the business than the average board of directors. For a company with no money, or only unmarketable stock, the leasing system is a good method to pursue. The lessees are the only ones who make any outlay. If they strike it, the company receives royalties on all ores shipped by them until the termination of the lease, and at the end of it have a good showing. Lessees are good judges and

are not inclined to waste money and labor on territory which is no good. Anyhow, there is some chance of finding pay ore in a property that is being worked, but none where a claim lies idle.

BISMUTH is precipitated quantitatively and in a compact form on a wire gauze electrode, provided that the current density does not exceed 0.5 ampere per 100 square cm., or 0.1 ampere per 100 square cm. for a solution containing 0.05 gram per 100 c. c. The best method is to dissolve the metal or compound in enough nitric acid to prevent the separation of basic salts on dilution to 100 c. c. to electrolyze with an E. M. F. of only two volts from a battery of accumulator in parallel, and to start the electrolysis at 70° to 80°, allowing the solution to cool gradually so as to automatically reduce current density as the solution becomes more dilute. The method does not suffice to separate bismuth and lead, for the lead peroxide which starts the anode always contains bismuth. The maximum error recorded for solutions of pure bismuth is 0.0005 gram on 0.01 gram of bismuth.

IT is sometimes hard to understand why structural steel and other materials suddenly break under a load far below that which it is rated to carry and even has carried. In the majority of cases it will be found that a metal suddenly breaking in this manner has been subjected to a series of violent vibrations similar to those received by a car wheel. These vibrations disturb and destroy the crystalline form and arrangement of the metallic particles, assumed when cooling or under special treatments. But when this crystalline structure is destroyed the metal no longer possesses its former strength. This will happen to almost any metal in state of vibration, no matter what the care taken in its preparation. Consequently, all structures should be guarded from successive vibrations; but if this is impossible, the material should be many times stronger than the load theoretically requires.

SODIUM is manufactured on a commercial scale at Niagara by the electrolysis of fused caustic soda. The electrolyte is maintained in a fused condition by the current which passes through it. An iron containing vessel constitutes the cathode and the anode consists of rods which dip into the electrolyte. The sodium after deposition rises to the top of the electrolyte and floats upon its surface. As it accumulates it is removed by small iron dippers. The sodium, after its reduction, is used in the manufacture of sodium oxide. This is done by spreading the metallic sodium on trays, which are placed in tubes, that are supplied with air, dried over calcium chloride. The sodium peroxide is then used for producing peroxide of hydrogen. For this purpose it is mixed with sulphuric acid, and during the mixture the temperature is maintained near zero by melting ice. This is necessary because of the unstable character of the peroxide of hydrogen.

THE effect of cold is to stop the setting of cement. Most cements set very slowly, if at all, below 32° F. When the temperature is raised the cement sets, unless in the meantime the water has evaporated sufficiently to leave an insufficient quantity for the chemical action, so that the freezing of work laid in cement mortar usually has the effect simply of delaying the hardening of the mass. If too much water is used in the mortar, the expansion of the water in freezing may disintegrate the mortar by mechanical action of the ice in forming. Alternate freezing and thawing increases the danger of injury. Portland cement is seldom injured by freezing, but many natural cements are more or less injured, and mortar of natural cement is liable to disintegrate even under the best of conditions, if the temperature is long enough or often enough below the freezing point before it has had an opportunity to set. One method of aiding the setting of mortar is to delay the time of reaching the freezing point by heating the stone or brick, the sand, the cement and the water. Freezing may also be delayed by covering the work with straw or tarpaulins. The most common preventive is a solution of common salt for mixing. Add 1% of salt to the water for every degree of temperature below freezing.

IN the Black Hills, South Dakota, district in the principal gold mills two kinds of single discharge mortars are used, each consisting of one solid casting, the bottom and sides so thick as not to need any lining, thickness decreasing as the feed is approached; outside walls vertical, with the exception of the discharge, which projects. The top is closed by two pieces of 2-inch plank, which rests on lugs ¾-inch wide, cast in the mortar, 2 inches below the top. These planks have each five semi-circular recesses which, when placed together, form holes for the passage of the stems. In addition to these five large holes, two smaller ones are bored for the 1-inch water-supply pipes, placed between stamps 1 and 2 and 4 and 5. Two mortars are placed close together, as the stamps of both are set in motion by one cam shaft. To reach the mortars, etc., a passageway is left between every two pairs of batteries. The water supply is derived from a 3-inch main, running along the front of the batteries. From it passes upward a 2-inch pipe between each pair of batteries. With this is connected a 2-inch horizontal pipe, from which four 1-inch pipes branch off at right angles, two for each mortar. In addition to this water supply, there is a 1-inch pipe at each passageway, close to the mortar, coming from 3-inch main. A hose is attached to clean the apron plates, and for other purposes. The points of difference between the two mortars lie in the inside dimensions of the lower part of the mortar and in the arrangement and number of the inside amalgamated copper plates.

Electricity in Mine Operations.

Considerable notice has already been made of the papers read and the work done at the recent sixth annual convention of the Pacific Coast Electric Transmission Association. In addition the following from the current issue of the Journal of Electricity, Power and Gas is given place because of its interest to mine superintendents everywhere. It is a kind of matter that can not be well condensed or abridged. As will be noted, it is a verbatim report of an oral discussion by members of that association, and apart from the technical part of it, there is a good deal of comment and opinion on subjects of considerable importance to every mine worker in connection with the ever-present question of power.

On the afternoon of the second day of the convention the secretary had read a paper by Mr. Hall on "The Application of Electricity on the Comstock Lode,"* when the following discussion ensued:

The President: This paper is very able and interesting, and is of great value to us. You will have perceived that without any suggestion from me. You have always refused to take any power of this sort, especially a mine hoist, because of the jerking of the voltage and the injury to the lighting system; but there are hints in this paper that encourage me to believe that such a thing will be possible for us in the future. We want to have a full discussion of this paper, and you can give to it all the time that you care to devote to it.

Mr. Fry: The real reason that the mining operation has to be so steady is because of the concentrators. Stamps don't matter quite so much. How is the Comstock? Are concentrators a very important factor in the mill operations?

Mr. Hall: We have nine Frue vanners in operation upon the same circuit with the hoists, and no trouble has been experienced therewith. The motors are not overloaded, and it takes considerable of a drop in voltage to lessen the speed perceptibly.

Mr. Fry: We find a variable load in Amador; even 1% they object to—not on account of the stamps, but on account of the concentrators; but if the regulation can keep within 1% there is no objection; but if it gets much worse than that they are heard from at once. There is one question I would like to ask Mr. Hall, and that is about the location of the fans in the mine. Are they on the surface?

Mr. Hall: The fans are all located in the mine, just as close to the work as possible. We have natural ventilation throughout the mine workings, and the fans drive the air from these to the working faces.

Mr. Fry: The fans about Amador and Calaveras are usually located on the surface. They have a unique method there of changing them from an exhaust to a blower. They have a combination of gates whereby they can reverse the current of air, and this gives cool air down the shaft for a majority of the time, and just after blasting they change the blower into a suction and so exhaust all the gases and powder smoke.

Mr. Hall: That is the same method I have adopted in the Hale & Norcross tunnel.

Mr. Fry: I would like to know about the two-minute peak. Is that recorded on recording voltmeters?

Mr. Hall: It is not recorded at all. We can't record it.

The President: If there are any further questions to be asked of Mr. Hall I suggest that they be asked now, and then I will have the other papers read, and then we will have the general discussion of the whole matter of electrical hoisting. Are there any further questions to propound to Mr. Hall? If not, we will listen to the reading of a paper by Mr. Poole on "The Economy of Electrical Power in Quartz Mining."†

Mr. Fry: Mr. Poole, in quoting Mr. Tregloan's article, stated that the power cost \$270; that is for two months; so it is really half of what Mr. Poole said, which is a sixty-day test. I don't know whether he made a mistake or not. It is not very clear in the article in the MINING AND SCIENTIFIC PRESS.

The President: Are there any interrogations? If not, before the general discussion, we will listen to the reading of the third paper, by Mr. Fry, on "Electric Pumping From a 1300-Foot Level."

Mr. Fry: Mr. Hall is talking about the amount of water lifted. They have three pumps. Couldn't they attend to your work very handily? Two of the three that you have installed, and handle the water?

Mr. Hall: About the same. Two of the three pumps installed will handle the mine water alone, about 300 gallons per minute.

Mr. Fry: There they don't need the reserve capacity. In some mines in El Dorado, pumpmen tell me, they are up to their waists in water trying to get the pump going, crawling up one hutton at a time. They can't get them in perfect condition. They get down a little ways, but they can never get

the pump going perfectly. If they can't put in a large pump, or several pumps, or have water skips to help them out, they are in a bad way. They want large pumps, or pump large enough to run only part of the time.

Mr. Stark: What means have they in case of emergency of getting the pump or the water out of the sump, if the necessity should arise?

Mr. Fry: The pump is on the 1300-foot level, in a place as dry as this room. The shaft is particularly wet. It would make you gag for breath to go down it; but the pump is 30 or 40 feet away from the shaft, in a dry place. Most of the water is caught up above that section. The sump is on the 2000-foot level. They would have to fill that mine up before it would drown it. If they put another pump at the sump they don't have to look out for it.

Mr. Stark: In locating a pump in a mine it has been the practice, particularly at Brown's Valley, to have it located at a lower level, whereas, in my opinion, they could have located a smaller pump at half the height and have saved three-fourths of the lift of the water; that is, in that particular shaft, most of their water is from a higher level, which is about 300 feet below, and they have located the pump at the 700-foot level. In that way, it strikes me, that some thought could have been put on it, and put in two pumps, and save in the installation in the first place.

Mr. Robert McF. Dohle: With reference to the Oneida, there are no workings practically above the 1300-foot level.

Mr. Stark: Where does the water come from?

Mr. Dohle: It works through.

Mr. Stark: Do you put in dams?

Mr. Dohle: There are no workings in that part of the mine. I noticed some literature the other day on this same question of pumps in mines. The pumps and motors are placed in steel casings, absolutely water tight, and are arranged so that even if the mine floods, the pumps and motors will not be wet; and they provide an air pressure from the compressor with the casing and prevent any leakage of water within, or any collapsing of the casing. Some blueprints were sent to me a few days ago showing that application of electric pumps in deep mining, which might be a good arrangement in works of that kind.

Mr. Fry: In and about Amador the mines are not very wet. Every vertical shaft is wet. We had rather a nasty experience splicing a cable 600 feet down, where it was raining pretty hard, and we had to keep it dry, and built a canvas house down there. But in that section I don't think they will ever have it flooded. Of course, it would be a good idea to house it in on the sump at the 2000-foot level, if they ever put in a pump down there, because there it might get wet; but as the mine is not a very wet one, as they can hoist 800 gallons at a skip, I don't think they need fear any trouble in that particular mine.

The President: For the general discussion we have had three exceedingly able and lucid papers, of great interest, doubtless, to many who are present. The views are somewhat divergent; there is opportunity here for discussion. We will be very glad to have you not simply criticize the paper, but also to discuss the general subject of hoists and the proper apparatus to work them.

Mr. Eastwood: I should like to ask a question; that is, why electric power has to be so heavily handicapped in order to get into use in these mines?

The President: It takes people some time to find out things.

Mr. Fry: I think that is because a good many mining superintendents are old men, and not used to that class of work. As the young men come up they won't have the same prejudice to huck against. You will find the younger superintendents taking to electric power a great deal quicker than some old men. I think it is a personal equation.

Mr. Lighthipe: I would like to ask Mr. Poole, in comparison with compressed air and the direct application, whether he has made the comparison by kilowatt hours. Assuming that both were buying on the meter, whether it would pay to use compressed air or electricity for hoisting. I would like to see the comparison made. He has gone into details against the use of oil and wood and coal, but I would like to see the amount of work done; the comparison with the amount of work done between the direct application of electric power and of compressed air.

Mr. Poole: I have prepared a few figures that touch upon this subject, and they work out something like this: 2375 British thermal units imparted to a pound of air will raise it 1° F. One pound of oil having 18,000 British thermal units, with a heater efficiency of 50%, will give 9000 heat units to the air— $9000 \div 2375 = 37,895$ pounds of air raised 1° F.

If we raise the temperature from 60° F. to 360° F. it will be increasing the temperature 300°. One pound of free air at 360° occupies 20.63 cubic feet, while at 60° the volume is but 13 cubic feet; this represents an increase in volume of 58%. If we divide 37,895 pounds by 300 we get 126, which represents the pounds of air that has been raised from 60° to 360°, and 58% of this represents the actual gain by reheating, which is 92.8. $13 \times 92.8 = 1206$, which represents the cubic feet of free air reheated to 360° by one pound of oil. Assuming the air engine to consume twelve pounds of free air per minute

horse power, then the horse power hours will be $\frac{1206}{12 \times 60} = 1.67$.

Oil at \$1.50 per barrel will make the cost per horse power hour \$0.00269.

Electric power at \$6.50 per horse power per month equals \$0.009 per horse power hour. Assuming the combined efficiency of electric motor and compressor to be 50%, then the cost per horse power hour delivered by the compressor will be \$0.018. Reheating this horse power of air with a pound of oil, at a cost of \$0.0045, increases the horse power to 2.67, at a total cost of \$0.018 + \$0.0045 = \$0.0225—the combined price per horse power hour = $\frac{.0225}{2.67} = \$0.0084$,

showing a little more than 100% efficiency. From these figures it appears that compressed air can be delivered to the air motor at the same price per horse power that is paid for electric power delivered to the electric motor driving the air compressor. That is like lifting yourself over the fence by your own hootstraps, but it figures up all right, and I think it can be demonstrated. These figures show more than 100% efficiency of the actual power delivered to the motor driving the compressor. While that cannot be realized in actual practice, we can easily figure on 75% of the actual power delivered. At that rate it would cost $1\frac{1}{2}$ cent per kilowatt hour delivered to the motor.

Mr. Lighthipe: I am assuming that in a certain part of the country the fuel bill is enormous, and I am assuming that electric power is available. If we use compressed air, can we reheat our air electrically with any economy?

Mr. Poole: Heating and cooking by electricity have always been considered a luxury, and while the efficiency shows up very high theoretically, in practice I don't know of any way of applying it to compare favorably with fuel oil at \$1.50 per barrel. I have not gone into figures on the subject, but taking what I have heard it is not practicable to do it against those prices for fuel.

Mr. Lighthipe: I don't want to assume oil at \$1.50 per barrel, because in certain parts of the State you can't buy oil at \$10 a barrel. Take, for instance, the Four Hills mine, where they have abundance of electric power, they would have to carry oil on the backs of mules 10 miles. I don't suppose they could get a tank of oil up there. We made little coils for them to use to keep the exhaust from their air operated pumps from freezing. The coils consumed 200 or 300 watts, and they kept the exhaust perfectly warm, so that it would not clog up. The question came up at that time, would it pay under those conditions, where the current is very cheap and fuel very high, to attempt to reheat our air electrically?

Mr. Poole: I should say, under those conditions, it can be done and done economically. Of course, when I stated that it was not economical to do it, I stated that on the basis of fuel oil at \$1.50 per barrel. The ideal way to reheat air would be to put your reheating device right into circuit with the air just before the air enters the air motors. An electric heating device applied in this way would prove very satisfactory.

Mr. Hutton: I would like to ask Mr. Poole if the compression he speaks of is a double stage compression.

Mr. Poole: The computation that I have just recited does not make a two-stage compression; it is a single stage compression.

Mr. Hutton: What pressure?

Mr. Poole: Eighty pounds.

Mr. Hutton: How much better results can be obtained from two-stage compression?

Mr. Poole: Better results by 15% would be obtained by a properly arranged intercooler and two-stage compression.

Mr. W. A. Dohle: In installing a compressed air plant for maximum efficiency the air should not be cooled in the compressor, but the compressor should be lagged the same as a steam engine. The pipes should be covered and the heat maintained, which is caused by the compression, and not thrown away, as the most serious loss in compression is the heat that you squeeze out of the air, in other words. By taking air and getting it hot and keeping it hot, you will secure all of the advantages without the reheating process; because in the arrangement you speak of there would be no reason why the compressor and receivers and the hoisting engine should not be close to each other, and no long pipes be necessary in which cooling could take place. Air handled in that way gives a decided advantage, because you save what otherwise becomes a loss of compression. If you take compression up to a point much greater than 100 pounds then your internal temperatures would become great, and it would be difficult to lubricate your surfaces. But going to the problem of hoisting in mines electrically: I was over in Colorado the other day, and they are hoisting electrically there very satisfactorily with a 300-volt direct current and with rheostat control; but they are using their skips counter-balanced, so that the motor has to work whether it is hoisting or lowering, and in that way they are getting a very satisfactory current consumption per ton of ore hoisted by having it over-balanced, so that the motor works when it is lowering, and it is hoisting counter-balanced. It is the

* MINING AND SCIENTIFIC PRESS, pages 111, 115, 116, Aug. 30, 1902.

† MINING AND SCIENTIFIC PRESS, page 231, April 29, 1902.

same scheme as used in passenger elevators. Another point which occurs to me on this electric mine hoisting is this, the mining companies have not been willing to install or to invest sufficient money to put in a suitable electric hoist. They are accustomed to buying boilers, brickwork, smoke pipes and steam hoist, and they don't look at that; that is a necessary evil, and when you ask a mining company to pay a few thousand dollars for a suitable electric hoist, they are not inclined to do so. Of course, in all engineering processes, it is pretty safe to start in on the most direct course, because it is safe to assume that any transformation or any changes that we take up are bound to cost us something in heat units to overcome them. I speak particularly with reference to the variable voltage control in hoisting, such as the Ward Leonard or some of the other systems that are now in use, and with a properly installed direct electrical hoist, using a variable voltage system, the efficiency of the operating mechanism is then brought up to the efficiency of high-class electrical apparatus, which brings it much above the possible efficiency of a compressed air plant. This system has not been used in any mine hoist on the coast, except in one small installation, but it has been used in the East on duties which are even more severe, like in the handling of rolling tables in rolling mills. I think we can build a plant, designed properly, and that with the use of the variable voltages the control of the mine hoist can be handled with absolute satisfaction. Of course, that requires, taking it from an alternate current transmission, first an induction or synchronous motor driving a direct-current generator. Then there would be a direct-current motor attached to the hoist, so that it requires two additional electrical units, or pieces of electrical apparatus, so that the horse power of apparatus installed would be practically 3 to 1. But the results secured are very satisfactory, because the current consumption is practically in proportion to the load handled, and the apparatus is exceedingly simple. Of course, there is another very satisfactory way, though not as good, and that is by using a series parallel controlling apparatus, such as is used on street cars, which gives fairly good results. There is one advantage in using the compressor, and that is when your hoisting engine and boilers are on the ground; but ordinarily the hoisting engine is so inefficient that it would very much exceed the steam consumption that you mention, namely, approximately about thirty pounds. It is a very excellent steam hoist that will anywhere near approximate that. Then when you take into consideration the leakages that come into the compressors and engines of that type after they have been used, the steam consumption or air consumption materially increases, whereas by taking the same cost of investment and putting in a direct electrical apparatus, or, perhaps, even a lesser cost of investment, the results would check out, I believe, fully as satisfactory, or more so, besides having a simple plant instead of a composite one. The plant I speak of was tested on the Gottschalk mine. That was on the Ward Leonard system, taken off the California Exploration Co.'s lines. I watched that ammeter while it was running, and the current consumption was almost absolutely in proportion to the work done, without any sudden rise in current consumption in starting the load.

Mr. Fry: In regard to that I don't see where the advantage would be over the system that Mr. Hall spoke of. There is three times the outlay and three times the risk of breakdown, and practically the same variable load—not quite as variable, but very nearly, as the variation in the load as in the altering device; and I don't see just where the advantage would come in. Another point is, that you not only increase your first cost of machinery three times, but you multiply your inefficiency. If you get 90% of one, two a little over 80, and three is in the 70's.

I would like to speak about reheating the air. I think it is necessary to cool the air in a compressor. You cannot get too much receiver capacity. To insulate all that heat, and to insulate down into the mine shaft, I think it would be out of question in the first cost. So few of them realize what the receiver capacity amounts to. South Spring Hill is a small receiver capacity, to be sure, but it was large compared to the motor, and the saving there was exceedingly great. Of course, that case was a particular one, and it was well worked out by Mr. Tregloan, and fit the circumstances exactly. They saved \$70 a month over and above the cost of the electric power; in fact, over \$2 a day saved on the installation, and they were able to hoist three times the amount of rock with the same amount of labor, and the expenses were \$70 less. It was merely a test, but the conditions were very unfavorable. It was an old type machine, taken out of a junk pile, you might say, and the conditions were anything but favorable. They did not have time to put the air piping into the hoilers in perfect condition, but blew it in on top of the water; but at the same time there was a saving, and in that case it was a very nice installation; but a large mine would need an exceedingly larger receiving capacity. You don't all realize that, because the moment you are using air a little faster than you are producing it, then you use more—you multiply it and it runs right away from you. We had a 30 H. P. motor, siphoned the water out of

the tunnel, and she couldn't hold up; she would average about 26 H. P. night and day, and couldn't satisfactorily operate the one drill; it would get away from us. That same 30 H. P. motor, running a compressor a little smaller, and using on the average 21 H. P. night and day, wouldn't run two drills, and the extra air went into the boilers and practically did all the hoisting through the day time. So the compressor was shut down, and Mr. Tregloan understood the situation very well and got in receiver capacity enough. Fortunately, he had it right there. So many mines put in ten times the compressor power—put it all in compressor and don't have anything in storage—and the hoist is variable. When she stops you are loading up your receiver, and, if you have not receiver capacity enough, she gets away from you, and you can't catch up again.

Mr. Lighthipe: Speaking about the direct application of direct current, Mr. Stark may tell us about several hoists in Grass Valley. I know of two that were installed there in series parallel, the power coming from a synchronous motor coupled to a direct-current generator, the direct-current generator supplying the current for a series parallel hoist. I know of one, especially, in the Gold Hill mine there, for which we made a very easy hoist—a very easy start, by putting in resistance in the field of the generator—a 500-volt generator—and we pulled it down to somewhere in the neighborhood of 200 volts. This generator was heavily over-compounded, and in throwing on the series parallel hoist we started with a voltage of about 200 volts, and the machine compounded itself as the load came on and made a very smooth acceleration. Of course, the hughoo in all hoisting work is the acceleration of the heavy mass, the same as in street-car work, and any method, such as the Ward Leonard system that Mr. Dohle spoke of, that will take off this high peak in starting, is a great benefit both to the consumer and to the company that furnishes the power. There were several of these hoists, I think, installed in Grass Valley before we had properly developed a good variable speed induction motor. At that time the variable speed controller had not reached the place it had when Mr. Hall had charge of the Comstock installation, but it filled the requirements in several hoists. Of course, it complicated the apparatus, but I think if any tests were made it would show good economy. The series parallel controller for hoist work has been very ably experimented on in the Dunsmuir hoist. The first three hoists established there were made of a regular railway type of motor, with a rheostat control. The additional hoists were made with the series parallel control, and the watts per ton lifted from the hold of the vessel was just about one-half with the series parallel controller as it was with the resistance type. Of course, the lift is very short. It is the acceleration. Before you are through accelerating you are breaking, and, in fact, a great deal of our mine work is that way unless we have a long lift; we don't fully get up speed before we begin to slow down again, and anything in the way of hoist work, in direct application, we have to set at variable speed that shows some economy.

Mr. Poole: Referring to Mr. Dohle's remark in reference to the compression of air in a compressor, his ideas are all right if you can use the air as soon as it is compressed, with this exception: that when you compress your hot air and keep it hot you increase the power required for compression.

Mr. W. A. Doble: The fact is that compressors are being run compressing up to a pressure as high as eighty pounds, and higher than that, and running without any cooling whatsoever. I did not quite understand Mr. Fry's remarks as to conveying this air down into mines for any great length of pipe, or keeping that free from cooling, because, as I understood, we were discussing the question of mine hoists where the compressors and receivers could be close to the hoisting engine. If you are running with steam you lag your pipes and lag your drums, and all to keep them hot, and I see no reason why, if you are running with compressed air, you could not preserve the heat that you necessarily develop in it in the process of compression much better than to throw it away, even though your oil only costs you 1% or 2%; you save that much, and it seems to me no huge difficulty. We do a great deal in the compressed air business, and I see no difficulty whatever in keeping the air hot, and with properly lagged receivers, which are very simple, it makes that much economy. It is being done in some places. The air is being compressed and the initial heat is maintained. Of course, for underground working, I don't believe that any air pump will equal the results secured from an electric pump. We have had enough experience with that to get very satisfactory tests from it, such as Mr. Fry mentions in the Oneida. Mr. Lighthipe will remember the old Gover plant; that was the first electric pumping plant, as far as I know, ever installed; it ran right along with exceedingly favorable results, and the cost of maintenance was very low. In fact, I tested the pumps at one time, and the current delivered to the motor was a little better than 75% of the theoretical power required to lift the water on a 500-foot single lift.

Mr. Poole: I don't want to pose as antagonistic to electric power for any purposes, but I do advocate that in the ordinary mining, as it is carried on today, especially with installations already installed,

compressed air for hoisting purposes, to my mind, is superior to electrically-driven hoists. The efficiency, I think, can be made fully as well by proper reheating and proper looking after the compressors and your hoists. I do believe, though, that the hoists should be somewhat reconstructed to get the best results. But the net results, I think, can be just as efficiently obtained by using reheated air and electrically driven compressors. The reliability is a very important factor, and when you talk to an old mining man about putting in electric hoists he is very skeptical. If he is away off somewhere where he can not get anything but electric power, he will take it, but it is only as a last resort. He will take almost anything else before he will take electric power for hoisting purposes.

Mr. Stark: As to the question of running hoists, and hoists only, I will go into the details of the plant that Mr. Lighthipe spoke of. That is similar to the Ward Leonard automatic arrangement entirely. The voltage on the direct-current generator that is driven by a synchronous motor—it is at the Gold Hill mine. The generator voltage is lower; the machine is somewhere about 10% or 25% over-compound. The control is with two motors, multiple series, and, as it starts in series, the current is low and the compound is slight, and hence the hoisting effect of that on the compounding makes a very slight draft on the alternating current synchronous motor. As the speed increases, by cutting out your resistance the compound increases, your voltage increases and the speed of your hoist; the whole thing is beautifully automatic, and is not an infringement at all on the Ward Leonard scheme, and acts just as well.

Mr. W. A. Doble: There is one thing I would like to speak about, and that is that receivers out of proportion to the size of the compressor make a serious drag on the system, that when your work is heavy you have a low pressure in your receivers, and your compressor has to have double work to catch up. That was found out at the Eagle-Shawmut mine, where they use a great deal of compressed air. They found that after they increased their receivers over a certain size in certain portions of their work, the receivers became a detriment. It is just the same as they found out in rolling mill engines, as to the effect of the flywheel, that in rolling very long rails the flywheel is of disadvantage, because as soon as it lost its inertia it became a drag on the engine. The receiver, if it is overproportioned, has the same effect. It becomes a drag on your compressor; at the Eagle-Shawmut they propose to now put in an automatic device, which is more on the principle of a hydraulic accumulator, where the receivers will be connected up to a column of water, and, so as the air is used out, the pressure in the receivers will be kept constant, and, as the air accumulates, it simply drives the water back up the hill, having the same value as an ordinary accumulator in hydraulic practice, otherwise as soon as the receivers begin to lose pressure they become a drag on your system.

Mr. Fry: Very few mining superintendents put in too much receiver capacity. I think that might be overcome by a check valve.

Mr. Doble: You lose your pressure in the receiver. If you have something that will maintain that pressure and give you the last air in the receiver at full pressure, you then use your entire receiver capacity to advantage; they are accomplishing it there by running a water pipe up the mountain, and with that they get a constant pressure on the air, no matter how little air they have in the receiver. Otherwise you draw on your receiver; the air is of such low pressure it is of no value and becomes a drag on the compressor.

Mr. Poole: It seems to me that would be evidence of not having receiver capacity enough. If you have no range in working pressure the receiver is of no use whatever. If you have a range in the pressure—that is, working range—of course the receiver is useful so far as they will keep within that range, and to that extent only.

Mr. Doble: But a receiver will hold a great many cubic feet of air, say, forty pounds, which would be too low to be of any value, whereas if that receiver is drawn down half way, if they could still maintain the pressure, which they do by water, then the full receiver capacity would be available.

Mr. Lighthipe: Wouldn't it be cheaper to use an accumulator, as is done with water elevators?

Mr. Doble: Except the capacity may be limited; and friction and leakage would be a serious item.

Mr. Poole: I would like to ask Mr. Hall with reference to the measurement of their electric current used on the hoist. Did I understand it was by ampere-hour meter?

Mr. Hall: At the present time there is no measurement taken at all. The contract is that we buy 1000 H. P., whether we use it or not. Our consumption is less than 1000 H. P., and there is no measurement taken. The electric current is supposed to be measured on a recording voltmeter, which would indicate the two-minute peak load. Up to this time we have not been able to get an instrument that will do that.

Mr. Poole: Will it be a wattmeter?

Mr. Hall: Yes, a recording wattmeter. In addition to that I have put integrating wattmeters at each installation, and from these I propose to divide up

the consumption of power between the various companies.

Mr. Lighthipe: About four or five years ago I tried to get the General Electric Company and the Union Iron Works to build a hoist, using an induction motor on which the rotor and stator, as Prof. S. P. Thompson calls them, revolved in opposite directions, the taunts being equal and the speeds being equal; then both sides would belt on to a shaft with a bevel gear, after the style of the old Pelton differential governor. Both revolving at the same speed, the bevel gear would stand still—that is, the journal in which the bevel gear rested would stand still. This was connected directly to the hoist shaft. Then, by breaking either the rotor or the stator of the induction motor, you could gradually accelerate the hoist in either direction. But nobody enthused over it, and we dropped it.

Cumal Property in Sonora, Mexico.

In the last three years great prominence has been given northern Sonora. Under date of the 9th inst.,

shares are owned principally by Oakland and Los Angeles men, and the capital to properly explore and exploit these surface croppings is to be California money.

"The four cuts show prominent places on the surface of this property, and the cut No. 1 is said to be the greatest surface showing of profitable ore on the American continent.

"A recent discovery of extensive and rich placers on the 'La Angostura' group adds to the value of the Cumal Co.'s holdings."

The property is 70 miles south of Tucson, Arizona.

The History of a Catalogue.

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. H. FITCH.

As I pass along the streets of the "Loop district" of Chicago few signs greet my attention more frequently than this: "Wanted, a Gordon Feeder."

The patience of Job Printing has a counterpart in the

hunger of this Gordon for whom it is so difficult to hire feeders. The operation of feeding paper to the Gordon, a press with a round platen, seems to be quite a simple one. I see boys getting \$9 a week placing sheets of paper for the Gordon press, and others a little older getting \$13 a week on the larger cylinder presses, some of which run by electrical power. And from the frequently posted notices feeders would seem to be in good demand. The presswork is one of the most interesting and expensive contributions to the catalogue, and I always think leniently even of catalogues which are conceived in vanity and issued in uselessness, knowing that they help the boys and maintain the trade appetite for Gordon feeders.

The paper stock also figures out quite a considerable item. But if I have the work plated, or electrotyped, so that no composition is necessary, I nearly cut the cost of the catalogue in two. Large editions divide this cost over a greater number of catalogues, and in figuring composition as half the cost I had in mind editions of 3000 to 5000.

One of my sage superiors at the great works somewhere gave orders to economize in the publication of catalogues by issuing editions of 1000 instead of editions of 5000. To this I demurred and produced figures to prove that it would be more

expensive to issue editions of 1000 at a time than to issue editions of 5000 and throw 2000 away. And I am free to confess that in our manner of handling and distribution we pretty nearly did this very last thing.

single average shop, which on an expenditure of about \$4000 a year would amount to about \$1000. But the effect on quality and uniformity of work was not calculated to arouse enthusiasm, and if any one said our catalogues were fine he was immediately suspected of being a millman out of a job or some one with an axe to grind.

Another economical measure was the use of page plates. Expense for plating at 40 cents a page applying to a second edition is against \$1.75 for composition on the first edition. Subsequent editions up to 30,000 or 40,000 copies were figured as costing nothing for composition. The result was that issues that cost us \$3000 would have cost \$5000 or \$6000 if set up anew every issue. Still, the plates would get battered; perhaps the typesetters would rough it to them in the interest of business, but the roughest treatment they had was on account of our own disposition to change things. Small changes were made by plugging the plates at 15 cents a plug. Larger changes obliged us to reset pages, in which type of slightly different style was used, and the final effect was not typographically elegant.

On this system, in the year 1896, the number of

Surface Showing of Copper Ore, Cumal Mines & Development Co.

J. D. Burgess, consulting engineer the Cumal Mines & Development Co., sends some photographs of the company's property and says:

"The Cumal Mines & Development Co.'s property is about 18 miles southwest of Nogales, in So-

Croppings of Ore, Cumal Mines & Development Co.

catalogues issued figured out exactly 100,000, ranging from 8 to 184 pages each. The cost was only \$2000 for the entire lot, twenty-six different catalogues averaging thirty-eight pages apiece, and costing about 2½ cents apiece. The 184-page catalogues,

Prehistoric Arastras and Buildings, Cumal Mines & Development Co.

nora, Mexico, and comprises 667 pertenencias, included in nine groups of mines. The ores are copper-silver ores, carrying a small amount of gold, and are sufficiently ferruginous and calcareous to smelt well without foreign fluxes. The group known as 'La Fundaciones' covers the ground which the Mexican engineers in 1854 established as the place where the great number of huge 'planchas de plata' were found. One piece of nearly pure silver weighed 2700 pounds. The Cumal Mines & Development Co.'s

Ancient Smelters and Buildings, Cumal Mines & Development Co.

We followed the practice of good purchasing agents by turning every stone and giving all comers a "chance to bid." The bids on average ranged from 1 as the lowest to 1.66 as the highest on the same specifications. Sometimes one bidder would be high and at the next bidding, determined to win out, would make the lowest bid. Again a well employed printing shop would not bid as low as a shop more anxious for work. The effect of this policy was to reduce costs by at least 25% over reliance upon a

subject "Gold Stamp Mills," from plates with changes cost 6 cents apiece.

This was in the day of economy. My own idea of a better kind of economy would have been to reduce the bulk of the catalogues, cutting out irrelevant matter and putting the money saved into better printing for the remainder. But the tendency was to "bulk up" editions with the pet ideas and loose phraseology of different people, and if a man could sell a machine the catalogue editor was enjoined to

let him run almost "any old thing" into the catalogue.

In the attempt to make more elegant catalogues the system of plating was abandoned. On one of these more elegant catalogues, richly embellished with new halftone cuts, printed on heavy enameled paper, and more than all employing the services of expensive engineers for a year or two in its composition, the actual expenses were per copy for an edition of 5000, 216 pages, 6x9-inch standard, each book weighing sixteen ounces:

Paper	5 cents
Composition	11 cents
Presswork	2 cents
Electrotypes	2 cents
Changes	2 cents
Engravings	11 cents
Services	28 cents

Total.....61 cents

The postage was 9 cents with weight of envelope included. The pictures were handsome, but the text was not brainy, nor well arranged, nor of much definite value in point of information. It should be said, however, in justice to persons who make and edit such productions, that they work under sealed orders, and are not expected to furnish any information which will enable a customer to find his own way without consultation, or give a hint useful to the engineers of a competitor.

One of these catalogues, touching a metallurgical subject, was unique as a masterpiece of work of this kind. It was written by a scholarly man and revised by an Eastern critic, so that in style as a piece of Addisonian English it was perfect. Magazine articles of the ordinary run are rough writing compared with it. Apart from some general principles it gave no useful information. Despite its williness and elegance the reader absorbed the impression that further knowledge could be had only after a handsome investment. The whole edition was called for in a short time, implying widespread interest. But it convinced no one. It was written to too fine points. The hunt man looking for a plain yes or no found more to suspect than to help, and the booklet did not sell a single plant or promote a single metallurgical enterprise.

Another catalogue by the hustling salesman of a large machinery house had an opening load in a long paragraph that was calculated to give a person the headache. It appeared to have a show of reason but made no sense, reached no conclusion. The trouble with the writer was that he did not posit or state anything, but got lost in a long string of qualifying clauses until at last he forgot to put in the positive statement on which such clauses need to rest. In the next edition I broke that paragraph up into five sentences with a positive statement in each one of them.

I do not want to be personal or I could furnish some curious examples of absolute inanity formulated into the appearance of rational statement by some experts whose literary and metallurgical training has been of the highest order. I shall never forget the charming candor of one of these gentlemen when I diffidently indicated the matter. "That's so," he said after a little thought, "I never looked at it in that light before. It's a sure enough fallacy. Strike it out of the next edition."

Some of these instances ran through many editions, and no one noticed them. This brings up the question: Do people read catalogues? Not generally to any avoidable extent.

In an existing catalogue I made a bad mistake. It was on an important point of theory. When I found it I was worried. I said: I will let some one else find it, for I could not see that it would lead to any injustice or business deception. No one has apparently noticed it. I have some friends who would be tickled to find it, but I fear they are not interested readers of my catalogues.

Another case. A credit notice was put in a catalogue. It made trouble. Our agents did not read it. We did not notice the effect of it ourselves. But way down in Bolivia a Spanish gentleman who read catalogues studied it out, and claimed 1% discount on the strength of it. Our agent reported this loss and suggested that it be charged to the catalogue editor, but he found little difficulty in unloading the responsibility upon some one else.

We hurried to get this credit notice out of our catalogues, but next year a competitor in the Far West brought out a brand new catalogue in which he copied our page with the offending notice. Lightning seldom strikes twice in the same place, and it may be that he will never be troubled by Bolivian catalogue readers.

These paragraphs have introduced a semi-responsible person called the catalogue editor, whose relation to our subject may be illustrated by the story of the negro preacher who said: "When Moses was with the Lord in the Garden of Eden," at which one of his elders pulled his coat tail and whispered: "Moses wasn't there," and after several such interruptions of increasing emphasis, the hangered speaker turned upon his critic with the declaration: "I say he was there, or thereabouts." The catalogue editor isn't there until some wrong is discovered, and then he comes in handy. Being a Yale alumnus and a graduate student of Harvard, at the races, whichever side won, I was always on the defeated side. Such ex-

periences educate one to be a catalogue editor, and I was never reconciled to having my ideals of what a catalogue should be twisted out of all recognition until I became convinced that catalogues are rarely read. For this reason a catalogue should have a richly embossed cover. We are too much concerned about the insides of books, and the best part of the show is usually on the hill boards, where he who runs may read, if his early education has not been neglected.

What we need to do with catalogues is to use them to reach the sympathies of those to whom we send them. As it is we expend our money and energies in getting them to a list of people, and when they reach the mark they fall like spent balls without making any impression.

The test is this: A good catalogue is good enough to be paid for. Because catalogues are free, and are forced upon people like sturdy heggars for attention, they are essentially poor.

Put the matter this way: Suppose that catalogues were required to be so interesting that people would pay for them, or else they would have no circulation. Would there not be something of an awakening in the subject matter of catalogues? It is true that some very poor technical books are sold for money, but the purchasers do not usually find what they are until they are paid for. Both are frequently poor, but the pooriness of the catalogue reaps a reward of inattention, while that of the technical book reaps a reward of small circulation.

But the strong living commercial force behind the catalogue makes it a more promising proposition than the text-book. I want to reach people with my wares. Using 6x9-inch circulars, I can send for about \$100 eight-page circulars to about 6000 persons, or twenty-four-page circulars to about 3800 persons, or seventy-two-page circulars to about 1200 persons, or 216-page books to about 550 persons. This would look promising were it not that it is hard to get good lists of people likely to be interested, and most of those who receive the catalogue can say in the language of current slang: "It never touched me." With all the halftones, and embossed chalky paper and fine pictures and gilt covers, the usual catalogue is only good in an inferior sense. It has no magnetic attraction of value in itself. It is not a treasure, nor a companion, nor anything like the helper it might be to the person who obtains it. It does not put itself in a man's place and guide him with sincerity in what he can best do. Now this is not cheap and easy like most catalogue composition. It requires more cleverness, more ability, more knowledge, more acquaintance with the subject, more sympathy with the man, and more impartial truth.

But if this kind of value is put into a catalogue, it will be found out. It will not have to be forced upon lists of reluctant recipients. It will not have to be given away. It can be sold. It will require the best durable binding. It is a commentary on the lack of value in the ordinary catalogue that it is usually given a paper cover that will stand little use. This is an advance admission by the publishers that it will not be much used, nor very useful.

Our catalogues may be called good as catalogues. But they must be "damned by faint praise" when we allow that they are partial and plausible, perfunctory in treatment, ill digested and ill fitted to be a complete reliance for their readers on the subjects treated. Their cheapness is often dear in the long run. There is in this or in an improved world to which they will happily contribute room for catalogues of a worthier character than the kind we now have. There is scope for more conscience, and more diligence in making them, and when we see fit to put this value into them they will be worth buying.

But how, it may be asked, will fare the commercial interests which put forth such ideal catalogues? In answer to that I would say "excellently well," for although some business men yield to the temptations of the "short measure and deceitful weight," I am sorry for the man who has lost hold upon the principle that good business is in its greatest success for the largest good of all concerned.

(TO BE CONTINUED.)

The Traveling Salesman.

The traveling salesman is regarded by some at a high value and by others as an evil—a necessary evil. Speaking from a manufacturer's point of view, he costs money, and, whether he brings in orders or not, his expenses go on just the same, eating up the profits of the business. He is out for orders, and may think that with getting them his responsibility ends. The firm must take care of these orders, must fill them, settle any misunderstandings, take all the chances of getting back not only his salary, but the salaries of the workmen in the factory, the interest on the money invested in the business, the taxes, insurance, wear and tear of machinery, losses on poor accounts, depreciation of stock and materials—in fact, there seems to be no end to the expenses the firm has got to stand before they can figure out any profit to themselves in the business. All the worry, the care and detail must be borne by somebody. Somebody must stake everything, and wait patiently for any

return for their own hard work and capital invested. When traveling men appreciate this fact they begin to be really valuable to any firm. The man who stands up and asserts that after he has turned in his order the firm has no further claim upon him, may be right according to the strict letter of the law, but he is not the most valuable salesman the firm could employ, and the firm knows it. The man who takes no further interest in the business than to do no more than is absolutely required of him to enable him to hold his position, is not the man the firm will ever tie to, so to speak. In these days—in any day for that matter—and all the time, the traveling salesman who takes off his coat and says to himself: "I will do anything in my power to help the firm that employs me, as if it was my own business," that salesman is bound to become an indispensable man. Not only the orders on the road, but the credits and collections, and a thousand and one things come under his eye, and he can give valuable advice and suggestions in all these matters. When he is at the factory between trips, there is always work to be done and he will pitch into it and make himself as valuable at headquarters as on the road. That is the ideal traveling salesman—the salesman who ought to have an interest in the business, or some time know just how to successfully run one of his own.

Details of Cyaniding.

Written for the MINING AND SCIENTIFIC PRESS by
ERNEST GAYFORD.

Following is an account of the process of milling employed by the Horseshoe G. M. Co., Fay, Lincoln county, Nevada:

The ore is delivered direct from the main shaft of the mine to the crusher chute. In the center of the chute it passes over a grizzly with bars set $\frac{1}{2}$ inch apart, the undersize going direct to the storage bin, the oversize going into a No. 3 D style Gates crusher set to crush to a $2\frac{1}{2}$ -inch ring. The product of No. 3 crusher passes over another grizzly, by which the material under $\frac{1}{2}$ inch in size is taken out and falls into the storage bin, the coarser material going to an H style gyrating Gates crusher, and is reduced to $\frac{1}{2}$ -inch mesh and discharged into the storage bin, which has a capacity of 300 tons. From the storage bin the ore is fed by a plunger feed working fifty-two strokes per minute, and feeding 3 pounds to the stroke, to a Gates revolving dryer making forty-five revolutions per minute, and is passed into the hoot of No. 1 elevator, taking from fifteen to twenty minutes in its passage. No. 1 elevator is set at about 70° angle and consists of a 14-inch Leviathan belt with 6x12-inch huckets set at 24-inch centers. This takes the ore as it is discharged from the dryer and delivers it to a 4x8-foot revolving screen. Here the 6-mesh material is taken out and sent by gravity to the hoot of No. 2 elevator. The oversize (material coarser than 6-mesh) falls direct to a set of 36x15 Gates rolls, whence it goes again to No. 1 elevator and is again elevated to No. 1 screen. The undersize from No. 1 screen is taken by No. 2 elevator and delivered to two 4x8-foot revolving screens, by which the 12-mesh material is taken out and drops into the hoot of No. 3 elevator. Material too coarse to pass through a 12-mesh screen is taken by gravity and passed through a set of 26x15 Gates rolls, again sent to No. 2 elevator and again elevated to No. 2 screens. The undersize from the No. 2 screens is elevated by No. 3 elevator and discharged in equal streams to three 4x8-foot revolving screens, where the 24-mesh material is screened out and dropped into the pulp storage bin, which has a storage capacity of 150 tons. The oversize from the 24-mesh screens is sent to another set of 26x15 rolls, when it is again elevated and again screened. From this it will be seen that once a finished product is made—that is, once any portion of the ore is reduced fine enough to pass a 24-mesh screen—it is sent direct to the storage pulp bin. It never goes again to any crushing machine, thus obviating the danger of sand packing in the rolls. The mill, when running to its full capacity, will crush about 110 tons to 24-mesh. The mill is driven by a 16x36, high pressure Bates-Corliss engine, power being supplied by one 80 and two 60 H. P. boilers.

LEACHING ROOM.—This consists of nine circular all-steel tanks, 24 feet diameter, 5 feet deep in the clear. Each tank is provided with a false bottom, made as follows: 2x2 $\frac{1}{2}$ -inch slats, with half holes bored on their under sides (to allow free passage for the solution to the outlet pipes), are laid on their narrow dimensions on the bottom proper of the tank, the slats being 8 inches from center to center. These come to within 2 inches of the sides of the tank. On the top of the slats are nailed 1-inch boards, perforated with 1-inch holes, bored 3 inches apart. A 3x1-inch strip is then bent around the circumference of the false bottom, so leaving a 1-inch space between the side of the tank and of the false bottom. The filter bed is then laid on the false bottom. It consists of a circular canvas-bound filter of cocoa matting, which, when tacked down, reaches to the outer edge of the false bottom. On the top of this is laid a second filter of 10-ounce duck canvas, made 6 inches wider in diameter than the cocoa matting. This is stretched in place by means of a $\frac{1}{4}$ -inch rope, which

is wedged down into the space between the false bottom and the sides of the tank. On the top of the canvas $\frac{1}{2}$ -inch channel iron strips are nailed 4 inches apart to protect it from the shovels when discharging a tank. Each tank is fitted with four discharge gates with 16-inch openings and four 2-inch holes through various places in the steel bottom, under which flanges are riveted to receive the pipes for carrying the solutions to their respective launders. A double line of track for the charging cars is suspended over each tank. The pulp is trammed direct from the pulp bin, a sample taken from each car, each carload weighed and emptied into the tank receiving the charge, each tank holding about 95 tons dry pulp. When the tank is full the top of the charge is nicely leveled off and is then ready to receive the cyanide solution, which is put on as follows: Above the leaching tanks are placed three stock solution tanks 15 feet in diameter and 9 feet deep. These tanks also act as sump tanks, as will be seen later. Two of these tanks are used for strong solution and one for weak. From the two strong stock tanks a $2\frac{1}{2}$ -inch iron pipe runs round the entire leaching room, resting on and placed a little inside the tanks. Two and one-half-inch plug valves are placed on the line over each tank, and a $2\frac{1}{2}$ -inch drop pipe runs from a tee on the main line and extends down just beneath the filter cloth of each tank. A $2\frac{1}{2}$ -inch line is run on the opposite side of the leaching tanks from the weak solution stock tank. When a sufficient quantity (from 24 to 26 tons) has been collected in one of the strong stock tanks a sample is taken and its strength in cyanide tested. It is then made up to a 0.3% solution (the strength of the standard solution used) by the addition of the necessary quantity of fresh cyanide. The solution is agitated by air by means of a 1-inch pipe line from the air reservoir. This also helps to aerate it.

The standardized solution is now run onto the charge in the leaching tank by means of the drop pipe attached to the strong solution line. This saturates the charge from the bottom. The valve on the stock tanks is regulated so that the solution is allowed to percolate up through the pulp at the rate of about 2 tons per hour.

After the charge is thoroughly saturated, taking about 25 tons solution, all the valves are shut off and the solution is allowed to remain in contact with the charge for twelve hours. The gold solution is then slowly drawn off by means of the discharge pipes underneath the tank and led into the strong solution launder, which carries it to the strong solution receiving tank.

After the charge has received about 40% of its weight of strong solution, 30 tons weak solution—averaging about 0.16% in cyanide—is run on the charge from the weak solution stock tank and through the weak solution main. This solution is carried off by the weak solution discharge pipes to the weak solution launder and into the weak solution receiving tank.

After the necessary weak solution has been run on the charge, 8 tons of fresh water are run on from the water main into the leaching room. The tank is then allowed to drain down until it only carries about 15% moisture, and is ready for discharging, which is done by being shoveled out of the four discharge gates into ore cars placed underneath.

The whole operation of filling, emptying and leaching requires nine days, allowing two days for filling and emptying. This gives the tank seven days to be under solution. Quicklime at the rate of 0.2% per ton of ore is fed with it into the No. 3 crusher to neutralize any acidity, and the consumption of cyanide per ton of ore ranges from .40 pound to .45 pound, giving a gold extraction of from 84% to 90%.

The gold solution in the receiving tanks is pumped by means of two $4\frac{1}{2}$ x3x4 Gardiner pumps to two 9x15-foot gold tanks, one for the strong and one for the weak solution. Connected by means of $2\frac{1}{2}$ -inch iron pipe with the strong solution gold tank are three precipitating boxes. These boxes are 9 feet long and 1.6 foot wide, and are divided into seven partitions $15\frac{1}{2}$ inches wide, 9 inches long and 16 inches deep, with one compartment at the end 14 inches long, which acts as a settler. A screen made of No. 16 iron punched with $\frac{1}{8}$ -inch holes is rested on $\frac{1}{2}$ -inch cleats, where it cuts the box off square. These screens support the zinc shavings which are packed in each of the seven compartments. The gold-bearing solution flows up through the shavings, down through the 2-inch space between each partition and up through the zinc into the next compartment.

It takes about 125 pounds of shavings to fill the box. The consumption of zinc per ton of ore varies from .25 pound to .30 pound. A continuous syphon sample of the solution is taken as it flows in and out of the zinc box, which is assayed every day for its gold value. This shows from 90% to 98% extraction, 75% of which takes place in the first two compartments. The gold-bearing solution in the weak gold tank is connected with one zinc box of similar pattern. The solution as it flows from the zinc box falls into the stock tanks mentioned previously, two of which are connected with the strong zinc boxes and one with the weak. This solution is re-strengthened and again used in the leaching tanks.

Twice a month the boxes are cleaned out. The system pursued here is as follows: The solution above the screens is drawn off by a $\frac{1}{2}$ -inch hose attached to

the $\frac{1}{2}$ -inch plug valves at the back of the box, and is run down into the stock tanks below. The less decomposed zinc is lifted out and laid on one side, and that which is badly decomposed, and shows signs of richness in gold, is taken out. Usually there is nothing above the screen in any but the first two compartments rich enough to take out. The screen is then lifted out, the plug taken out of the 1-inch pipe in the side launder, and the rich gold slimes are allowed to run down the launder into a receptacle placed to catch them under the outlet of the launder. These slimes, together with what was taken from above the screen, are put in an iron filter tank. The zinc box is washed out well with clean water. These washings are added to the rest in the filter tank and the bulk is allowed to filter by gravity. The less decomposed zinc is placed back in the head compartment of the zinc box and fresh zinc is placed at the lower end to fill up the box.

When the bulk of the moisture has filtered out of the gold product in the filter tank it is taken out and placed in a steam dryer and thoroughly dried. It is then roughly sampled and transferred to a zinc-lined box, sealed up, and shipped to the buyers, where it is accurately and carefully sampled, the sample cut into three equal parts, one assayed by the sender, one by the buyer and one sealed for an umpire's sample, should any difference arise. This sample is seldom used. The gold is settled for on a basis of \$20.10 per ounce and the silver at 1 cent less than New York quotations. The product shows a value of from \$75 to \$92 per pound in gold and about \$2.50 in silver. The cost per ton of milling, including all expenses, is \$1.35.

Appended is a table showing extraction by assay (theoretical extraction), extraction by bullion (actual extraction), average heads value, etc. This table is interesting because of the extraordinary closeness between the actual and theoretical extractions, as it covers a period during which nearly 50,000 tons were treated, showing that the system of sampling employed was accurately and carefully carried out, and also that the work done in the assay office was of a first-class order:

	Gold.	Silver.
Average heads value (by assay).....	\$ 7.45	1.215 oz.
Average tails value (by assay).....	1.08	0.717 oz.
Theoretical per cent saving.....	85.50	41
Actual per cent saving (by bullion).....	85.12	41.65

Tons crushed, 48,714; average consumption of cyanide per ton of ore, 0.405 pound; average consumption of zinc per ton of ore, 0.27 pound.

Robins Belt Conveyors as Tailings Stackers.

The plant of the Gold Pen Engineering & Mine Supply Co. is one of the largest placer mining operations in the world. It is situated at Breckenridge, Colo., on the Colorado & Southern Railroad. Some three years have been required to prepare the plant for operation. This work consisted of building a large ditch or canal 3 miles long and 8 feet wide, into which

Belt Conveyor as Tailings Stacker.

the water from the river is diverted when desired. At the lower end of the ditch the water enters a 60-inch pipe line, $\frac{1}{2}$ mile long, which feeds the hydraulic elevators and giants, the pressure at the elevators being 170 pounds per square inch. The season at Breckenridge is limited to 200 working days, and it was, therefore, important that the plant should be equipped to handle large quantities of gravel, as the river has not sufficient volume to take care of the desired amount. It became necessary to dispose of the tailings in some other way, and it was found that a mechanical device of the requisite capacity was made by the Robins Conveying Belt Co., 15-21 Park Row, New York, two of which were installed, as shown in the photographs here reproduced.

The conveyors are used in connection with the

Evans hydraulic elevators, the water rushing through the down-takes of which sucks the gold-bearing gravel in and raises it through the up lift pipes to the sluices—stones as large as 10 inches being lifted in this way. In the bottom of the sluices are the riffles which collect the gold.

The cut shows the sluices at the start of operation, when water and stones simply discharged from the end of the sluices to fill up a hollow which existed at this point. In the present operation a grizzly is placed at the end of each sluice, which allows the water and fine gravel to pass through it and fall into the natural channel of the river. The material which is too large to fall through the grizzlies goes to the receiving hopper of conveyor A. This hopper can be seen under the temporary flumes in the cut. Conveyor A elevates the material to a point over the track of the Colorado & Southern and discharges to Conveyor B, which is equipped with an automatic tripper, and running at an inclination of 7° reaches a height at its farther end of 80 feet. The tailings will be discharged by the conveyor about the trestle on which it runs, and when the trestle is completely covered by them the conveyor B will be moved off onto the pile thus formed. By keeping the conveyor moved close to the edge of the pile and allowing the tailings to fall over the edge a pile of enormous size can be formed.

The conveyors are 36 inches wide, A being 110 feet long, running at an angle of 23°, and B 300 feet long, running at an angle of 7°. They have a capacity of from 400 to 500 cubic yards of material per hour.

Mineral Wealth of China.

Written for the MINING AND SCIENTIFIC PRESS by
F. R. WARDLE.

The Empire of China is a sealed treasure house of vast mineral wealth, awaiting the hand of destiny to unlock its resources and lift its people from poverty and ignorant prejudice to a foremost place among the richest producing nations of the world. Many astute observers believe that the hour will soon strike—the key will force open the lock—and China will yield up its hidden riches, in such volume and value as will astound the world.

Coal exists in all the eighteen provinces; iron and copper in very extensive and widely distributed bodies, especially through Shansi, Shantung and Szechuen; gold in Manchuria, Shantung, Shansi, Shensi, Aupeh, Honan, Hunan, Szechuen and in almost all the northern and central provinces; silver, tin, lead and other metals abound. Diamonds are found in the blue clays around Ichoufu in southeastern Shantung, and other precious and semi-precious stones at various points throughout the Empire.

Each nation in its turn, as the hour of destiny strikes, has opened up its stores of treasure—first America, then Australia, later Africa, now Asia—nature's splendid crescendo.

During two years of travel in China, just completed, I met many of

the leading mining engineers, chiefly Americans and Germans, long resident in the Orient—such men as Deetring and Hoover of the Chinese Engineering & Mining Co. at Tientsin, Michaleis Hildebrandt and Director Schmidt of the German Mining Syndicate at Kiautschou; Captain Rich, Leigh Hunt, Archibald Little and others familiar with the upper Yangtse—and all agree that in coal and iron and, possibly, in the precious metals, China is to be regarded as one of the richest countries of the world. Millions of square miles of its vast territory have never been prospected; but within the comparatively limited area open to

expert European examination immensely rich deposits have been discovered, and in some cases concessions for their future working have been secured from the government at Pekin.

Taking up, now, the study in detail of the mineral resources of each province, commencing in the north, we find, first:

Manchuria, with an area of 380,000 square miles and an estimated population of 22,000,000. It is a terra incognita to European prospectors and, under Russian domination, is likely to so remain. During my visits to Port Arthur, Dalny, Talienhwan, Newchwang, along the Manchurian coast, I heard from Russian sources enough to satisfy me that the interior of the province is rich in metals and minerals, especially in gold, which shows in many of the streams and in

outcroppings of ledges. At one time mining for gold was a crime and miners were beheaded when caught; but the peasants have always worked in a crude, small way, and considerable quantities of gold have been produced.

Manchuria is a splendid, rolling country, full of beautiful scenery, abounding in fine forests and streams; a well-watered, grazing country, with a bright, cool, stimulating climate, peculiarly adapted to Europeans. Notwithstanding renewed protestations, designed to keep England and the United States quiescent, Russia surely intends to hold fast this long-coveted country, which she seized by force and retains under cover of false pretense. I have heard Russian officers brag when in their cups ("in vino veritas") that Russia would never loosen her grip on Manchuria unless compelled through force of arms by England, America and Japan. As long as smooth diplomatic assurances that the occupation is merely temporary find credence in Downing street and at Washington, so long will Russia continue successfully her nice little game of expert lying, in which she has only two equals—His Satanic Majesty and the Unspeakable Turk.

So, despite its richness, fine climate and virgin opportunities for profitable exploitations, Manchuria will not be for us the much-vaunted "open door"—that door opens only inward toward St. Petersburg, while the nations, like the foolish virgins in the parable, stand outside and knock in vain for entrance. It will take Krupp guns to knock with effect—nothing less.

South of Manchuria and Mongolia there is a wide belt of country, commonly referred to as North China, comprising the three adjacent provinces of Pechili, Shansi and Shensi, within which are the great coal measures that make China one of the first coal countries of the world. In the province of Shansi alone there are fields of bituminous and anthracite coal known to cover an area of 26,500 square miles. The concession to mine the Shansi fields is held by a wealthy English syndicate, which at present is not in active operation because of recent Boxer troubles. Large hodies of iron lay adjacent to the coal—conditions that have made Birmingham, Ala., so prosperous.

At Tongshan, in Pechili province, the famous Kaiping collieries are located, the output of which at one time reached 2,000,000 tons a year, but later fell off considerably. This valuable property is owned by the Chinese Engineering & Mining Co., recently taken over from its Chinese owners and placed under English management by Messrs. Moreing & Co. of London. A friend of mine, who knew the facts, told me that during the period of Chinese control over 6,000,000 taels (\$4,100,000) of the earnings were wasted and misappropriated by dishonest native officials. With honest and capable management, the property should now become a good dividend payer—a feeling evidently reflected in the recent advance in shares.

The sphere of German activity in railway building and mining lies immediately south of Pechili, in the province of Shantung. The Germans have fallen into the way of calling a considerable portion of this province "the hinterland" of their new colony of Kiautschou, and they consider it within their "sphere of influence." The eastern portion is mountainous and forms the promontory of Shantung, jutting far out into the Yellow sea. The western part is a fine rolling country, diversified with many beautiful valleys and streams. Shantung is the sacred province of China, containing the tombs of Confucius and his disciple Menicus; the holy mountain of Nansan, upon whose summit, 5000 feet high, an ancient order of priests have maintained continuous worship for 4000 years; then there is that stupendous work, the Grand Canal, over 600 miles long, which reduced to beggary the generation that built it; and last, but not least, there is the Yellow river, called by the natives "China's Sorrow," because its periodical floods bring destruction to life and property along its 1000 miles of tortuous course.

Tsingtau is the seaport of the German colony of Kiautschou, and thence a fine railroad has been built back into the interior as far as Wei-h'sien, opening up immense coal fields and iron mines around Poshan, some day destined to become a second Pennsylvania. A line of German steamers runs from Tsingtau to Shanghai and there connects with the North German Lloyds and Hamburg-American lines direct to Europe via Suez Canal. Shantung has an estimated population of 29,000,000 hardy, industrious people, who, under German tutelage, will develop greater industrial prosperity than forty centuries in the past have brought to them. From personal observation of the betterment brought thereby, I have become a staunch believer in "the partition of China" as the best and, in fact, the only way out.

In German Tsingtau the land theories and single tax ideas of the late Henry George are receiving their first practical testing. The Colonial Secretary, who is a doctor of philosophy of the University of Leipsic, became a convert to these views during his student days, and here in Kiautschou has put them into practical operation in a series of remarkable land laws, by which private title to land is abolished and only the usufruct, or use of the land, is sold for 25-year periods to those who erect buildings and begin improvements. There is only one tax levied in

the colony—an annual 6% tax on the original value of the land before improvements are made. There is no other tax of any kind and for the colony itself no customs duties.

Kiautschou is prospering and its port of Tsingtau will in time become of great importance. Greater freedom of individual initiative might advantageously replace some of the Government's paternalism and officialism. The advice about Lazarus, "Loose him and let him go," forms the best policy for vigorous pioneer colonies. That life hegets self-reliance and a desire for unrestricted action.

As Russia holds Manchuria for Russians, so Germany desires Shantung for Germans, and, while there is not positive exclusion, little effort is made to attract outsiders. In slicing up China, the various nationalities remind one of a pack of hungry, snarling dogs, each trying to drag off its particular bone and growling when would-be sharers of the spoil approach. The exhibition of naked, unblushing selfishness made by some of the Allied (?) Powers in China is not an elevating spectacle. If human nature be a poor, shabby thing, it is at least well to hide it under decent garments of convention.

(TO BE CONTINUED.)

Mining and Metallurgical Patents.

Patents Issued October 14, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 710,935; A. Avery, Lowell, Mass.

Combination of shaft lining or casing, compressed air engine secured in casing, drill head rotated by engine having cutting bits arranged to operate in advance of casing to make opening of greater diameter than casing, engine being provided with dust chamber into which it exhausts and with passage outward from dust chamber between engine and casing, drill head being provided with dust discharging openings leading from front thereof into dust chamber to allow dust and cuttings to be carried from front of drill head back of engine and out of casing.

WIRE ROPE TRAMWAY.—No. 711,451; W. C. Davis, Denver, Colo.

In an overhead wire rope tramway, combination of stationary cables and traveling cable normally located above stationary cable, terminal stations at which stationary cables are suitably anchored, two stationary cables forming opposite sides of tramway line, traveling cable being suitably supported at stations and forming two sides of line intermediate the terminals and traveling in opposite directions, tower located between terminal stations and having two sheave wheels mounted thereon, arranged to engage portions of traveling cable moving in opposite directions, and two other wheels mounted on intermediate tower below first-named wheels and adapted to en-

gage stationary cables which cross between their engaging wheels and change sides of line at this tower, and bent track rails bridging gaps between stationary cable lines at this turn.

ORE SEPARATOR.—No. 711,015; A. H. Stebbins, Little Rock, Ark.

Combination of box-like frame wider at one end than other, means to deliver material across entire width of separator at its widest part, discharge opening at smaller end of separator, separating surface arranged within frame above bottom thereof to provide air chamber beneath surface, being provided with openings arranged at intervals directed substantially in plane of surface to discharge air or fluid blasts over separating surface and through material being treated to thereby stratify same according to specific gravities and move it toward discharge end of separator, series of cutting and conveying boards arranged above separating surface inclined thereto with cutting edges nearer to surfaces than discharge edges to thereby cut top strata from material and remove same from separator, means to direct blast of air or other fluid into chamber beneath separating surface.

REVOLVING FURNACE FOR ROASTING ORES.—No. 711,338; P. Naef, New York, N. Y.

Revolving roasting cylinder having an outer shell, brick lining, iron ore lifting devices, with radially adjustable bolts extending from outer shell through brick lining to ore-lifting devices and adjustably supporting latter independent of brick lining, whereby interior fittings can be repaired or renewed without interfering with lining and central supports for ore-lifting device.

ROASTING FURNACE.—No. 711,352; D. Sheedy and M. W. Iles, Denver, Colo.

Furnace adapted for roasting, drying, calcining and chloridizing of ores and other materials having in combination base or hearth, frame extending over sides and top of base, angles L L supported by depending rods J J, upper ends of which are secured to parts of frame extending over top of base, laterally braced by vertical parts of frame, fixed top supported on angles entirely suspended from frame, disconnected from base at such a distance above same as to afford continuous openings on both sides for passage of stirring and conveying devices, transverse scrapers and stirrers passing through lateral open-

ings on each side of furnace, endless carriers O O, one on each side of furnace, connected with scrapers, extending back over fixed top, tracks or continuous supports also situated each side of furnace, bearings for outer ends of scrapers supported and moving on tracks.

PROCESS OF RECOVERING METALLIC COPPER FROM COPPER PRECIPITATE.—No. 711,173; D. McKechnie, Liverpool, England.

Process of recovering metallic copper from copper precipitate, consisting in forming precipitate into bricks, briquettes or like, drying same, smelting and subjecting bricks to reducing action in cupola or blast furnace, drawing material into reverberatory furnace, maintaining material in molten condition, separating copper from slag while material is in molten state, finally refining the copper.

SAVING FINE GOLD AND SULPHURETS.—No. 711,047; F. M. Graham, San Jose, Cal.

Process of treating gold-bearing material containing free gold and sulphurets to separate latter from residuum, which consists in causing stream of mercury to flow in one direction, adding water to gold-bearing material, causing water and gold-bearing material to flow on surface of stream of mercury in opposite direction to flow of latter, recovering free gold amalgamated with mercury, intercepting sulphurets carried on top of stream of mercury in opposite direction of flow of water, removing sulphurets thus accumulated.

HYDRAULIC RAM.—No. 711,076; J. Richards, San Francisco, Cal.

In hydraulic ram, an air chamber horizontally disposed, receiving chamber therein projecting laterally beyond air chamber on each side, waste valves mounted on projections outside of air chamber, check valves mounted on receiving chamber inside of air chamber, supply pipe to receiving chamber, discharge pipe from air chamber, curved snifting pipe, having ball valve at its extremity, for admitting air to air chamber, pipe being adjustable at various angles to vary gravitating resistance of ball to ingress of air.

ROCK DRILL.—No. 711,102; A. D. Foote, Grass Valley, Cal.

Combination in rock drill of cylinder, piston reciprocating therein having direct connection with drill shank, inlet and exhaust ports connecting with ends of cylinder, rotary oscillating valves located between ports, valve chamber within which valves are contained and with which communication is alternately formed, inclined surfaces formed on inner ends of pistons, oscillating member located within valve chamber, extending into path of travel of inclined piston face, oscillating connections between member and valves whereby they are oscillated.

HOISTING AND DUMPING DEVICE.—No. 711,049; C. Jackson, Denver, Colo.

Combination of hoist, consisting of posts or supports, iron frame secured to posts, upward extension posts or supports to top of which is secured cap or frame, provided with lugs, sheave adapted to operate between lugs upon journal passing therethrough, rope or cable operating over sheave; with dumping device, by means of which bucket is conveyed and dumped at any convenient point from shaft, consisting of a T-rail secured to iron frame which is attached to posts, T-rail extending outward and slightly downward from point where it is secured to iron frame, having supporting rod or stay secured to outer end of T-rail and to lugs supporting sheave, truck device consisting of hook suspended from flanged rollers which operate upon T-rail, large hook contrivance, swung into semicircular indentation in hook of truck device, adapted to grasp bucket, rope or cable by means of which bucket is dumped, adapted to be passed through sheave attached to iron frame, thence through sheave attached to truck device, one end of rope being suspended into shaft to which is attached weight, other end provided with hook adapted to be attached to bottom of bucket when dumping.

PROCESS OF MAKING GRAPHITE.—No. 711,031; E. G. Acheson, Niagara Falls, N. Y.

Method of making graphite, which consists in introducing into an electrical furnace mass of carbon to be graphitized, in form of lumps, also introducing thereto volatilizable material capable of forming carbide, heating same to high temperature, vaporizing volatilizable material, thereby causing vapor to permeate charge of lumps and to graphitize same.

APPARATUS FOR USE IN EXTRACTING PRECIOUS METALS FROM THEIR ORES.—No. 711,236; H. Smith and P. C. Brown, Salt Lake City, Utah.

In lixiviation apparatus, revoluble tank for containing ores, pipe extending through one end of tank and upward almost to internal wall, means for rotating tank, pipes for supplying solvent solution, air and steam to tank, outlet for expulsion of air.

SLAG STEAM GENERATOR.—No. 711,290; L. D. Copeland, Los Angeles, Cal.

Slag steam generator comprising generator casing having seat, slag receiving receptacle movable in casing adapted to be seated with its open end on seat, charging device on generator at seat adapted to deliver molten or hot slag to receiving receptacle, means for supporting and tilting receiving receptacle when moving off its seat, cross bar held in casing adapted to divide or break up slag when dumped from receiving receptacle.

METALLURGICAL FURNACE.—No. 711,062; P. Meehan, Lowellville, Ohio.

Furnace for treating molten metal comprising rotary barrel-shaped furnace having open neck at each end, annular bands having V-grooves secured to barrel, bearing frame provided with semicircular V-grooved seats, anti-friction balls between bands and seats, mechanism for rotating barrel in frame, trunnions on which bearing frame is mounted, mechanism for tilting frame about trunnions.

Has the Desired Article.

TO THE EDITOR:—On page 193 of your issue of Oct. 4, 1902, I see where "F. T. S.," of Copper Mt., Alaska, wants "one ton or more of nicely colored rose quartz." We have the same and, possibly, pink satin spar, as wanted by "F. T. S.," Copper Mt. Our rose quartz assays \$40 gold, ten ounces silver, and from a trace to 4 1/2% copper. If your inquirers wish a ton or more of this ore we can let them have it for \$200 per ton on the dump. It would cost \$3 per ton to haul to Myrtle Creek station for shipment, making it, sacked and delivered at station, \$204 per ton. At a depth of 70 feet this ore changes to a white quartz. Myrtle Creek, Or. B. M. ARMITAGE.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The U. S. Geological Survey expedition headed by F. C. Schrader, has returned from the Copper River region. The past season's work, which began in May, extended over a vast territory known as the headwaters of the Copper, Tanana and Nebesna rivers. A sub-expedition, headed by T. G. Gerdine, worked in the heart of the Copper River valley. Schrader says the year's work was satisfactory.

ARIZONA.

COCHISE COUNTY.

The Tombston Con. Includes sixty-eight claims. There are four steam hoilers. The four-compartment shaft is 24 by 11 feet. The pump station at the 600-foot level is 14 by 61 feet, and the capacity of the pump over 20,000 gallons per minute. For some time they have had men opening, cleaning and enlarging the old drifts and running new drifts to make connections with the shafts for ventilating purposes.

Fifty-seven mining locations were filed for record at the recorder's office during the past week. The locations are in all parts of the county.

The Old Terrible M. Co. at Manzora, in the Dragon mountains, has a new 20-stamp mill which daily crushes and mills sixty tons. The fuel used for running both the mill and pumping plant is crude oil. The ore runs \$20 to the ton, concentrating in a ratio of 8 to 1, and produces seven and one-half tons of concentrates, averaging approximately \$160 per ton. The mine and mill is in charge of J. R. Carey.

GILA COUNTY.

Globe reports that the strained situation that has existed there between the Old Dominion C. Co. and the miners has been adjusted. The superintendents of the four mines are preparing a proposition showing the conditions under which the mines must be operated. The right of employees to organize for their own benefit was recognized. It is stipulated that the companies will not discriminate between union and non-union men, but the companies reserve the right to employ whom they like. The boycott, fair and unfair, is to be withdrawn. The scale of \$3.50 for miners and \$3 for top men shall remain as at present, and not to be changed without 30 days notice. No strikes shall be declared until the grievance has first been submitted to the employer and an effort made to adjust it. The union meeting accepted these terms by almost a unanimous vote. Railroad freight rates also have been adjusted satisfactorily to the companies. The miners will resume work at once.

The Old Dominion C. M. & S. Co., at Globe, has brought two suits in equity against A. S. Bigelow, its former president. An attachment levied on his property has been released by the filing of a bond for \$500,000. The suits are brought in the Massachusetts Supreme Judicial Court to recover 30,000 shares of Old Dominion, or the proceeds thereof, which it is alleged were wrongfully delivered to A. S. Bigelow and the late L. Lewisohn, a director in the company, in exchange for deeds to four mining claims which have never been worked, and which the present management claims are of doubtful value. Recovery of 20,000 shares, which were turned over to the same parties for promoters' fees and expenses in connection with the organization of the company in 1895, is sought also.

President Smith, of the Old Dominion, says that the plans of the present management with regard to the immediate future are largely "in the air," that is to say, are contingent upon developments. The property as a mine, according to Mr. Smith, is of more promise than even expert reports had indicated. There are nearly 20 miles of openings, and the recent rate of production could be carried on for several years without further blocking out of ore bodies. The property, up to the time of closing down, several weeks ago, had been producing on an average of 10,000,000 pounds of copper per annum. At the present time the furnaces are not in operation, although development work underground is still being carried on.

With its present equipment of furnaces, the plant, it is claimed, can produce three times what it has been producing. When the matter of freights has been decided, the smelting of ores it is said can be done at 33% less cost than heretofore. There are at present on hand about 2000 tons of matte running 70% copper. It is upon the question of reversion of matte that the plans of the new management are not perfected. Various propositions have

been considered, but nothing has been permanently adopted. Such changes as will be made, it is stated, will require no more money than can be furnished by the company itself.

The A. B. C. C. Co. is organized to develop and operate a group of claims adjacent to the Old Dominion, United Globe and Arizona Commercial properties. A. E. Wiley is manager.

MARICOPA COUNTY.

The Phoenix & Eastern Railroad will be built from Phoenix to Benson and forming what may eventually be 180 miles of another transcontinental railroad. It will connect at Benson with the Phelps Dodge road, a part of the Rock Island system.

Near Wickenburg, at the Black Rock property, two shifts are being worked on a large low-grade ore body. On the White mine three shifts are driving a tunnel through the mountain along a well defined ledge, which, though considerably smaller than the Black Rock, is rich. The tunnel is being run from the bank of the Hassayampa through the mountain. At the Socorro mine the 20-stamp mill will be completed this week, when E. M. Keeley will give it a trial before turning it over to the company.

MOHAVE COUNTY.

At the Gold Roads group, near Kingman, it is stated the ore exposed, 100,000 tons, averages \$15. A cyanide plant is building under the personal direction of O. P. Posey.

Near Kingman a company is to be organized to work the Oro Plata mine; a fifty-ton plant will be installed, a calcining furnace put in and the product of the concentrating tables reduced on the ground. C. D. Pickering, at the San Francisco mine, has twelve men. A crosscut is being run from the bottom of the main shaft to cut the vein from wall to wall. The crosscut is in good ore. The shaft will be sunk to the 400 level. When the 400 level is reached a reduction plant will be in order.

A local report says: "The Gold Roads Co. are hiring all the miners that ask for employment. Over fifty miners have gone to the camp this past week. The company say they will put on 200 men."

YAVAPAI COUNTY.

W. S. Owen, superintendent Decatur M. Co.'s properties, in the Jerome copper district and Mineral Point gold district, has telegraphic instructions from the company's headquarters in Decatur, Ill., to begin operations on the Decatur group. Miners are driving the drift at the 272-foot level in the main shaft.

Manager W. D. Powell of the Black Rock G. & C. M. Co. is sinking a working shaft on the Ontario mine and has a ledge of gold, silver and copper ore. The vein is 5 feet wide; drifts are being run each way. The shaft will be sunk deeper and two levels run. Copper predominates in the ore.

With Manager Giroux's return much is expected at the Iron King. Surveys have been made to locate a smelter. A tramway will be built from the mine to the smelter 1 mile long. Houses are to be built, roads constructed and other improvements undertaken.

CALIFORNIA.

ALAMEDA COUNTY.

The Pennsylvania Mining, Developing & Operating Co. has incorporated in Oakland, capital stock \$200,000, \$3000 subscribed; W. F. Green, J. E. Henderson, A. G. Randlett, J. E. Fleming, H. G. Morrow, Oakland.

EL DORADO COUNTY.

At the Zimmerman mine, near the Pacific, eighteen men are employed. A tunnel will be begun between Pacific House and Bullion Bend, to run 3000 feet to strike the channel.

P. P. Webb has finished a 5-stamp mill at the Crystal mine.

HUMBOLDT COUNTY.

Manager Hales, Orleans Bar G. M. Co., says preparations are being made for next winter's run. The O. B. G. M. Co. are moving the machinery to a new bar.

KERN COUNTY.

(Special Correspondence).—Some time since a special correspondent of one of the leading Los Angeles papers was writing up some mining news in eastern California and Arizona and wrote an article from Randsburg stating that there had been a lot of friction between the Miners' Union and the Yellow Aster M. & M. Co., and that there was a prospect of the mine being closed down. A few days later, on Oct. 6, another article was published that the mine was closed down on Oct. 1. The article gave as the reason for the alleged trouble that the muckers had demanded an increase in wages. The paper that published this article in Los Angeles, under very large headlines, corrected it the next day in a very small note. Now,

nearly all of the papers on the coast, including some "mining journals," have published the statement that the mine was closed down, and while one of these "mining journals" in last week's issue published a letter from Randsburg correcting it, I have so far seen no other corrections. Misstatements of this kind, while they do us little or no damage, certainly do the company no good and they do Randsburg and that section very great injustice. Please publish that the statements that the mine was closed down, that the company had trouble with its miners, and that there have been demands made for increased wages, are wholly incorrect. Such correction, when published in your journal, will put an end to the general belief that the mine is closed down.

Randsburg, Oct. 20.

The Baltic M. Co.'s new 10-stamp mill is in operation at Randsburg.

MERCED COUNTY.

Lewisohn Bros. of No. 11 Broadway, New York, through their manager, E. G. Tuttle, are prospecting on the Merced river, 20 miles northeast of the city of Merced, for gold and other metals. A traction engine is running a drill; men are sinking shafts and others rocking out dirt and gravel, under the superintendency of E. E. McCarthy. The drills are sent down to the bedrock, which lies 15 to 20 feet below the surface.

MONO COUNTY.

The following is from the Reno Journal: I noticed in your paper of the 10th an item copied from the Gardnerville Record saying that myself and Mr. Blackburn had uncovered \$100,000 worth of rich ore. I wish it was correct. For the benefit of those who might spend their time and money I will say that it is not so. I bought nine-tenths of the Golden Gate property and Mr. Blackburn one-tenth, but we have not uncovered any ore, nor have we worked on the mine since my arrival here. We have some ore, but are not working the mine at present, as I am putting up buildings to live in this winter. There are no prospectors rushing in here as reported. I will not be ready to do any mining for at least a month, and allow no one to go into the mine, so you see the report of a rich strike is made out of whole cloth. I wish you would contradict that report as I don't like to see any poor devil spend his money and time on what might be a wild goose chase. When I make a rich strike I shall certainly make it known. I think our property is good, but I see no reason for an excitement so far. Yours truly, J. L. WEDEKIND.

Coleville, Cal., Oct. 14.

NEVADA COUNTY.

The first payment of \$5000 on the purchase price of the Perrin mine has been paid to C. W. Kitts by G. W. Root.

A stamp mill will be built for the Sixteen-to-One mine near Washington.

Manager Enzensperger of the Red Cross group at Nevada City, says the new mill will be ready for work in December.

Good ore has been extracted from the Black Bear mine, the Rough and Ready district. The Black Bear is under bond to San Francisco men.

PLACER COUNTY.

The Alameda G. M. Co. are building a 20-stamp mill at their mine in Black canyon, near Westville.

The Auburn Herald reports much activity in Ophir mining district.—The Eclipse 10-stamp mill is being operated by a 35 H. P. gasoline engine.—Kelly & Cox have taken out three tons free gold ore on the Folk Ranch on North ravine which netted \$1667 at Malmborg's mill.

—The Eclipse Co. have bonded the old Crater Hill mine from the heirs of the late G. D. Aldrich, and, it is reported, will begin operations on a large scale. It is estimated that nearly \$1,000,000 has been taken out of the Crater.—Near Bath fifteen men are employed at the Washington quartz mine. The mill is running steadily on good ore.—Work on the Dewey tunnel is being pushed.—The Leigh Canyon mine has had a clean-up, with satisfactory results.

SAN BERNARDINO COUNTY.

A deed is recorded in San Bernardino showing the transfer of the Birch Consolidated group of mines in the Vanderhill district from the Federal G. M. Co. to C. H. Thompson. The deed names \$150,000 as the price.

B. F. Lewis, of Los Angeles, has bought the Elvira group of claims. He will purchase the surrounding claims and form a company to develop the properties. The company will be known as the Parallel G. M. Co.

SAN LUIS OBISPO COUNTY.

The California Coal & Iron Co., owning undeveloped coal lands in the Huasna country, 30 miles from the city of San Luis Obispo, will begin development. The company was organized August 23, 1902,

capital \$2,000,000, W. W. Jennings president, main office at San Jose. The company owns 1600 acres. They are driving a tunnel at an outcropping and expect to strike a vein of coal 8 feet in thickness when in 100 feet. Forty feet has already been run.

The Stone Canyon Coal Co. is prospecting and developing their mine. They are down 410 feet, where the vein shows 17 feet of coal. They use two traction engines in hauling the coal to the railroad at Bradley, each engine hauling ten tons. The owners propose to build a railroad of their own to tide water.

SANTA CLARA COUNTY.

The New Cerro Bonita Quicksilver M. Co. is incorporated at San Jose, capital stock \$2,000,000, \$950,000 subscribed; H. R. Bradford, W. C. Kennedy of San Jose, J. and C. G. Treadwell, Oakland, B. M. Bradford, San Francisco, directors.

SHASTA COUNTY.

The Mountain Copper Co. is locating a number of claims in the territory immediately north of Whiskeytown.

The contract is signed for the construction of the McCloud River Power Company's dam and ditch. The board of directors will meet in South Dakota Nov. 12, at which time the contract will be ratified. Engineer Freeland is perfecting plans. Work will begin as soon as the contract is ratified.

SIERRA COUNTY.

The Crystal Lake M. Co., in a pocket partly blown to pieces by a blast, took out \$1500 recently. Five stamps of the mill have been temporarily closed down.

SISKIYOU COUNTY.

The Deadwood Q. M. Co. is incorporated at Yreka, capital stock, \$250,000, all subscribed; G. J. Reiner, E. T. Wallace, H. B. Gillis, R. S. Taylor and J. S. Cook, Yreka, directors.

Mining operations at the Cherry Hill gold mines are to be resumed. The tunnel now being driven near the base of Cherry Hill will be given an uplift of about 1300 feet, and through this tunnel all of the lodes in the Consolidated group of mines will be drained and mined.

The Jumbo mine, on White's gulch, owned by H. J. Eldridge & Co. of Sawyer's Bar, is to be worked this winter.

SONOMA COUNTY.

Surveyors in Pine Flat district are surveying the Crown Point, Hope and Quicksilver Queen mines, on which the owners, a stock company in which local people are interested, wish to get a patent.

TUOLUMNE COUNTY.

(Special Correspondence).—M. E. Sanford of Sonora bought at public auction the Columbus mine and North Extension, near Soulsbyville. These mines were the property of the late Citizens' Bank of Sonora.

The Eagle-Shawmut Co.'s 8000-gallon storage tank for crude oil at the Chinese depot of the Sierra Railroad is completed, and a 10,000-gallon tank is to be built at the chlorination works.

The Gold Ridge M. & M. Co. of Arizona, which is operating northeasterly and adjoining the Eagle-Shawmut mine, held its annual meeting to-day in Sonora. J. A. Van Harlingen was elected president, vice W. Jones, resigned.

Sonora, Oct. 25.

The Sunnyside tramway has been repaired and the machinery let down. A new cable has been bought. The mill will be started November 1. The Pine Nut and Viola claims, owned by J. Richards, are to be worked. The Truemeyer, near the Magnolia, is being crosscutted. The Magnolia and Argol claims, on the main river, are being developed. Mining men will open the Jersey Blue mine.

The Temescal mine, near Confidence, has started up. F. McPherson, the original owner, has leased it back from the company.

It is thought electric drills will be used in the Rawhide mine when operations are resumed. The Rawhide Extension Co. decline to use water or electric power on account of the long and expensive shut-downs, which they figure bring the cost of mill work, etc., up to the average of steam power with wood at \$5 a cord. They will use oil for fuel as soon as the present supply of wood is exhausted, finding it cheaper. Two other companies on the mother lode are figuring on running their plants by steam power the year around.

Sinking in the Dutch mine is resumed. The shaft is to be sunk 150 feet from the 1300 level.

Tuolumne reports that the strike in the New Era mine shows ore which runs \$260 a ton. This is a mine in which a former company stopped 8 feet from rich ore because of lack of funds.

F. McPherson is operating the Temescal mine, near Sugar Pine.

The Independent reports that R. Marshall has bonded to K. C. Parrish of Denver the Spring Gulch mine and mill site,

containing 39.28 acres of patented land, also the Canyon mine; purchase price \$30,000, \$15,000 to be paid within a year and the balance within two years from date. Parrish agrees to expend in development work in the mine, timbering, sinking and running drifts, levels and crosscuts at least \$1000 within each two months during the life of the agreement, and shall pay 25% of the gross proceeds of the mine which will apply on the purchase price. Sharwood & Marshall have bonded to him a three-fourths and one-fourth interest respectively in the Somerset quartz mine, north extension of the Spring Gulch mine; price \$6000, payable within two years. Holland, Carter, Hines & Gallagher have agreed to sell to him the New Era or Hunter mine, also a three-fourths interest in the Chilcote Pass quartz mine, the Plateau mine, and a water right of 500 inches of water in Hunter creek; price \$15,000, payable \$9000 before May 15, 1903; the balance before Nov. 15, 1904.

At the Old Street mine, Tuttle town, the lowest level has been entered north of shaft 200 feet. There is a body of ore that shows free gold after every blast. The mill is crushing by water power derived from the old Gale ditch. Oil is used as fuel at the hoist.

At the Bell mine, Tuttle town, a trial crushing is being put through. Sufficient gold has been seen in the breaking down to warrant a good return. The shaft is now 450 feet deep.

The Good Return Placer M. Co.'s property on the South Fork and main Stanislaus river has a crib wing dam 600 feet long. It is the intention next year to construct a concrete dam across the river, and at the low water season turn the water into the flumes.

At the Richards Placer Association, at Table Mountain, the No. 2 shaft is down over 400 feet and still sinking in cement, the pay gravel not having been reached. The superintendent thinks the dead river has made a turn to the west. Still a further distance will have to be sunk before the pay is struck. The water is held by a duplex pump, 4-inch discharge. At the Woodside gravel mine, near Springfield, sinking toward main channel has been temporarily suspended as the superintendent has been compelled to return to the east channel to make some repairs by timbering. The gravel found on passing through this channel had a value from \$18 to \$20 per cubic yard. In the Doyle gravel mine, Superintendent R. B. Stanford reports to the independent that the shaft is down 85 feet. A boiler, 40 H. P., has been erected capable of supplying power for the steam pump which has the water under control. The sinking is in cement and three shifts are employed. The object of this shaft is to find the position and trend of the channel of the dead river in Table mountain. The Neubaumer mine is being operated by Manager Demarest, of Altaville, who is running a prospect tunnel on the east side of the canyon of the Stanislaus river that will give backs of 700 feet when the vein is cut.

At the Densmore the superintendent is busy getting ready to start up in full force when the water comes.

In the Soulsby mine the main 200-foot level is entered 350 feet north of shaft. Drifting has been resumed in the new shoot that was discovered lately. Work is being carried on entirely by steam.

In the New Era or old Page mine, near Five Mile creek, owned by Corlin Bros. & Pownall, they are drifting on the footwall from the tunnel level. A water power hoist is to be erected in the tunnel at the shaft. A chamber has been excavated under ground for the hoist. A compressor and baby power drills will be installed.

TRINITY COUNTY.

The Journal says there is a full force on the Midas, which is yielding about \$35,000 a month in gold. The Dorleska has a very rich lead and returns several thousands per month clear profit. The Chloride-Bailey is being actively and intelligently opened up and in the very lowest workings, about 800 feet below the surface, there is a well-defined lead about 12 feet wide, 2 feet of which will average \$45 per ton in gold, the whole lead running about \$25. The new 20-stamp mill and tramway is a success and dividends are in sight in the Chloride-Bailey. The Globe is another good property and a recent strike in the lower levels proves that to be a property of great merit. The Bullychoop is a big producer.

G. B. Lowdon has gone to the Three Peaks G. Co.'s property with twelve men to put up the 10-stamp mill recently purchased. The company has also bought a large water wheel and will utilize the water power to run the mill.

YUBA COUNTY.

The California Debris Commission opened eight bids for the construction of the first of the Yuba river barriers above

Marysville. The lowest was from the Atlantic, Gulf & Pacific Co. for \$27,940.50. All the bids will be forwarded to the War Department at Washington, and it will be a month before the contract is awarded. The work can then be begun, as all deeds to the land are now in.

C. L. Crane will put a 25-stamp mill at Camptonville, on the Honeysuckle. He is superintendent and part owner of the mine.

COLORADO.

ARAPAHOE COUNTY.

Denver reports that the Colorado Fuel & Iron Co. has voluntarily decided upon a general increase in wages to the 10,000 coal miners in its employ. The increase is in a way a readjustment and in some instances amounts to 25% of the present scale.

BOULDER COUNTY.

At Caribou the Anchor is driving a crosscut tunnel to cut the Anchor lode, under the management of M. Wolfe.

In the St. Louis mine, under the management of Trollope & Habrel, three shifts are at work; the mill is running steadily. The shaft will be sunk 400 feet.

In the Grand Island district the Denver Tunnel Co. is driving its tunnel to cut about thirty veins traversing Chittenden mountain, west of Eldora.

CHAFFEE COUNTY.

The Futurity M. & M. Co., near Newett, has in place a hoist, 35 H. P. boiler, 700 feet of cable. Twelve men have developed the vein 22 feet, showing 3 feet thick, averaging nearly 12% copper and 10% lime.

CLEAR CREEK COUNTY.

The Waltham Co. is putting in a new steam hoist at the mine near Russell gulch. The company has a wide body of sulphide ore and enough value has been taken from development to pay all running expenses.

The Con. Franklin has started a shaft to connect with the adit driven through the Silver Age and Franklin territory. The company is also driving the level below the adit to the west, and last month T. R. Grasser with a machine drill in twenty-six shifts drove 144 feet—the best record so far made in this section. About 1500 feet in from the mouth of the adit a shaft was sunk and at 100 feet another level was started west. This has been extended 900 feet, passing through two ore shoots.

Near Idaho Springs, the Little Mattie has driven an adit level 2000 feet to connect the Mattie with the Newton mine, both of which are operated by that company. Ore was taken out in the drifts to keep the sixty-ton concentrating mill running.

J. J. May is manager the Millard M. Co., to operate the New Year mine on Seaton mountain. The shaft is 95 feet deep. They are sinking on a body of \$40 ore 1 foot in width.

Manager T. B. Crow is unwatering the shaft on the Consolidated Alpine and will sink from its present depth of 300 feet. A new air compressor has been installed.

The United Power Co. will run its electric plant at Georgetown by water power all winter. A contract is to be let to drive a tunnel 400 feet in length to cut under Clear lake, thus preventing the outlet from freezing up.

The Burns-Moore tunnel has closed down because of lack of water. Manager Schaller says that a steam plant will be put in. The tunnel has been driven 1000 feet.

The Sun and Moon mine, on Seaton mountain, Clear Creek district, is being worked through a shaft and also through the Newhouse tunnel. The company will install machinery in the tunnel and drive an upraise to connect with the surface workings—1200 feet. The large vein cut in the tunnel has been drifted upon for a distance of 1500 feet. This vein and the ore bodies have proven permanent.

Empire announces consummation of the sale and transfer of the Union group of claims on Silver mountain, for \$35,000, to a company composed of railroad men and residents of Nebraska. An adit on the Union proper has penetrated over 400 feet and uncovered ore bodies upon which stopes are progressing that yield an \$18 per ton crude mill dirt, and ore of three-ounce grade in gold, with some copper.

Manager Williams of the Specie Payment mine has the old Champion mine, which adjoins the Specie Payment, on Bellevue mountain, in Clear Creek district. The Specie Payment has a production record of nearly \$500,000; the Champion property is equally rich. The property lies just inside of the boundary between Clear Creek and Gilpin counties; the ore taken out goes to Gilpin county, thus giving that county the credit for it. The Specie Payment property consists of seventeen claims and is at the present time producing about \$5000 per month.

Near Idaho Springs W. E. Renshaw,

owner Gem mines, is sinking the shaft at the Gem extension and is down 800 feet. Mr. Renshaw is also working the property through the Newhouse tunnel, night and day drifting and preparing to raise to connect with the shaft. The raise is started over 1000 feet west of where the tunnel cut the ore body.

C. J. Green has charge at the Ben Doran mine for the Swiss-American M. Co.

P. Mixsell tells the Post of a recent strike in the Gem Extension mine, about 2 miles from the portal of the Newhouse tunnel. This vein was intersected at a vertical depth of about 2000 feet, where it was found to be 20 feet wide. While the tunnel was being pushed on into Gilpin county Manager Renshaw began upraising upon the Gem vein from the tunnel level and drifting both ways on the lode. He cut a station 20 feet wide, 250 feet in length, as a base for stoping. As fast as the ground was worked out square sets of timbers were put in, platforms built for miners, tracks laid and the stoping continued. The ore thus broken down is shot into bins at the tunnel level and conveyed to the mouth, the smelting product loaded into railway cars for conveyance to Denver, the milling stuff taken by wagons to the Newton concentrator on Clear creek. While upraising the miners cut into a body of mineral 8 feet wide, all smelting ore. Mixsell says it is the largest and finest block of ore he ever saw in either Gilpin or Clear Creek county. In addition, Manager Renshaw has from 2 to 12 feet of milling ore and is producing about 100 tons a day. In a short time he will be breaking and sending out over 500 tons a day. He is using modern drills, and electric hoists for raising timbers and supplies to the men working in the upraise and stopes. The vein is opened up for 500 to 600 feet on either side of the Newhouse tunnel and there are reserves ready for stoping.

CUSTER COUNTY.

The Custer M. & R. Co., which owns the town of Custer City, Silver Cliff mining district, 50 miles south of Cripple Creek, owns, by purchase and location, fifty acres of mineral ground and contiguous locations covering about twenty acres additional.

DOLORES COUNTY.

The Mount Goram M. & M. Co., operating the Almont property, near Dutton, has an ore body, average assays showing fourteen ounces gold and 400 ounces silver per ton.

GILPIN COUNTY.

(Special Correspondence)—The Pewabic mine at Russell Gulch is being unwatered. The company has had surveys made for a wire rope tramway from the mine to Idaho Springs—a distance of 3 miles.

The Saratoga mine at Russell Gulch is producing about eighty tons of ore per day. The main shaft is being sunk and is about ready to start a crosscut on the vein at the 1000-foot station.

The Yankee Con. M., M. & T. Co., Yankee, expect to put up a new mill this winter. The old 5-stamp mill which they now have on the property has been running steadily since June, and they will operate it until the new mill is finished.

Yankee, Oct. 15.

On Quartz hill the deepest gold-bearing vein in the State, the California, has its shaft in 2210 feet.

The Kansas-Burroughs Con. M. Co., P. McCann manager, employs seventy-five men, a number of whom are leasers. The deepest workings are on the Phoenix-Burroughs shaft, down 1300 feet, C. Horning superintendent.

GUNNISON COUNTY.

Near Pitkin, A. Lejune, manager Blistered Horn tunnel, will drive a tunnel into West Gold hill in the Tin Cup district—1500 feet, size 4½x7 feet in the clear. The tunnel will cut across the Tunnel lode, Overland end lines, Little Mack, Little Hattie, Cyclone and into the Minnie Hall. All these claims as a block of ground show promise of low and high grade silver, gold, lead and copper ores. The tunnel will cut into the mountain to a vertical depth of 1000 feet. The ore bodies in the Minnie Hall have been probed to a depth of 800 feet with diamond drills and shaft, which has shown bodies of \$20 ore.

JEFFERSON COUNTY.

(Special Correspondence).—The smelter at Golden was closed down for a few days on account of shortage of limestone. The sampler is running steadily.

Golden, Oct. 16.

LAKE COUNTY.

Gough & O'Rourke, at the President property on Breese hill, have a body of siliceous ore, covering the face of the breast, which samples four ounces gold and fifteen ounces silver. The ore lies between walls of porphyry. The material is of a siliceous character and the smelter will take all of it that is offered.

OURAY COUNTY.

(Special Correspondence).—At the Red Mountain district, Iron ton, H. Nash and J. Carroll have sold their claims for \$40,000. The cash payment was \$7000. Mr. Nash is to be superintendent of the property.

Iron ton, Oct. 14.

The Morning Star, Sneffels district, has machinery for working its drills by electricity furnished by a gasoline engine. This property is owned by Ouray parties and has a paying vein of silver with a percentage satisfactory in gold. The owners will keep at work all winter. The Altoona, Governor, Ruby Trust and Humboldt, in the same district, are all working and will continue all winter. Each mine has laid in its winter supplies. L. B. Jackson, president Imogene G. B. M. Co., has a good force at work.

Superintendent Wood of the Portland group, owned by the Ouray Chief M. Co., 1 mile from the town of Ouray, has a 550-foot crosscut and 300 feet of drifting on the vein. The ore runs well in gold, silver, manganese and lead. It is the intention to erect a 50-ton concentrating plant, electric power, transmitted from Ouray.

Superintendent Hart of the Box Canon M. Co. is working on the old Stenographer property, a high-grade gold producer near Ouray, lying in the quartzite contact of the west side gold belt.

PARK COUNTY.

W. H. Hollingshead at Fairplay has leased the Hill Top mine from the Colorado & Southern Railway, and is working it with thirty men.

H. Dyatt of Leadville has a lease on the Peerless Maud and is breaking out fine lead ore.

The Cincinnati G. P. M. Co., the Lowe Placer Co. and the Snowstorm-Hyde Placer Co. have closed operations for the winter.

PUEBLO COUNTY.

The Colorado Fuel & Iron Co. denies the report that the company contemplates purchasing the Philadelphia smelter at Pueblo. The Philadelphia smelter was a Guggenheim property before its absorption by the American S. & R. Co. It has not been operated for some time, as the company has several other smelters in Pueblo, ample to handle the output of ore.

SAN JUAN COUNTY.

The Lady Ellen mill on Mineral creek is reported doing good work.

SAN MIGUEL COUNTY.

The third level of the Silver Pick mine, all the workings above that level, with the stamp and concentrating mill and tram, has been leased for three years to C. Toland.

A strike in the Blue Lake vein in Bridal Veil basin shows an assay of \$300 per ton in gold, silver and lead.

The Special Sessions group of mines on Mount Wilson is sold to Chicago men. The group comprises six lode claims and one placer. Several thousand feet of tunnels, stopes and drifts have already been developed and 5000 tons of ore blocked out. A mill and tram with necessary mining machinery will be put in.

TELLER COUNTY.

Most of the properties on Gold Hill are being worked by lessees in blocks and with few exceptions the miners engaged in this kind of work are making better than wages. The owners of the different properties, however, from royalties derived from lessees, with few exceptions, are using the money in developing their lower workings. It is thought that the trustees of the Stratton estate may lease the greater portion of that territory. If this is done, several hundred miners will be put to work. The Stratton M. & D. Co. owns a large acreage on Gold, Ironclad and other hills in the northern section of the district.

The reported sale of the Mary McKinney is not generally believed. Officers of the company say there is no truth in it. The Mary McKinney carries the longest continuous ore shoot of any mine in the Cripple Creek district—more than 2000 feet.

The Requa mill in Requa gulch is now worked under lease and is treating on an average of 100 tons of ore per day; as no roasters are used, the quartz must all be oxidized. The lessee is getting his rock from the various dumps about the camp and as the mill is not on the line of any of the railroads, it all has to be hauled in wagons. A fixed charge of \$4.50 per ton is made and to this \$1 must be added for hauling. If when sampled the ore does not run \$5.50 per ton, the miner will be out any part of the hauling charges above \$4.50. That is, if the ore runs \$5 he will have to pay 50 cents a ton on the freight. But quite often the rock runs \$10 and sometimes \$20, so that a handsome profit is made. As a rule, the mine owner charges 50 cents a ton flat on all ore that yields a profit.

In the bottom level of the Moose mine,

Raven hill, the entire level is lined with tin, making it perfectly air-tight and only permitting in it such wholesome air as can be breathed by a human being. The Moose has been troubled with a noxious gas; thousands of dollars spent in trying to get rid of it have been useless, and operations have been interrupted. The gas is so heavy that compressed air sent down to the level ascends through it without disturbing it. Carpenters and tinners were put to work, the levels squared up and back of the timbers the space was filled with rock and dirt; the tinners for a distance of 500 feet covered the woodwork; then asbestos was put on. Work is being pushed, and it is thought that so long as arrangements are carried forward that mining operations will go ahead just as though there were no gas.

Manager Weston of the St. Patrick Co. will explore the lower horizons of its property by diamond drills from the breast of the 700-foot level, the deepest working in the mine.

The Dillon claim, on Battle mountain, has been leased to the Sparr G. M. Co., of which M. Finnerty of Denver is the principal owner. It is also stated that a bond has been given on this claim for \$350,000.

Stratton's Independence maintains regular daily production of 250 to 300 tons. The property is working a full quota of men.

The Woods Investment Co.'s Economic mill, Eclipse gulch, is running 250 tons through every twenty-four hours. The ore is received either through the United Mines tunnel, from the Gold Coin, or over the F. & C. C. and Midland from the Bull hill properties. The Economic mill uses the Argall roaster, a device made up of four iron cylinders 30 feet long and 3 feet in diameter. The ore is received into one of these tubes, all revolving together, which in turn churn and recharn the ore as a hot-blast flame plays upon it. The ore is delivered in the direction of the flame into a head directly under the hottest part of the blast, and is then dumped out and carried into eight coolers, which are tanks 16 feet long and 5 feet in diameter, revolving in water. The ore is thus cooled and is delivered by means of a spiral feeder to the elevators to a floor above the chlorination barrels. Here it is received into automatic weighers having a capacity of ten tons each, and is ready to go into the chlorination barrels. Each barrel has a capacity of treating twenty tons of ore at a time and is so charged. From 1200 to 1400 gallons of water are used in filling each barrel to a depth of 30 inches. Four hundred and fifty pounds of sulphuric acid and the proper proportion of lime bleach is put in and the whole mass—ore, acids and all—caused to revolve from two to four hours. The liquidation now containing the chloride of gold is strained through filters into seven bleaching tanks, each having a capacity of 8000 gallons each, and left to stand thirty minutes. It is then drained off into settling tanks, where it again settles. The liquid is now ready to go into the precipitation tanks, as all the sediment and refuse have been caught either in the chlorination barrel, the leaching or the settling tanks. As the fluid is strongly acid, no pumps can be got to withstand the action of the chemicals; it is elevated by the law of displacement; air is forced into the lower tanks, which in turn forces the liquid up by displacement into the tanks, where the precipitation is to take place. The entire volume is then subjected to sulphuretted hydrogen, the chloride of gold broken up and a sulphide of gold ensuing. The sulphide still in the water is run through the filtering presses and collected. It is then subjected to heat in the refining room, the sulphur is driven off, the gold collected and retorted.

Mine owners in the vicinity of Beacon hill and the Buffalo & Cripple Creek M. Co. are discussing arrangements for the latter to run its Newell tunnel until it penetrates the main water course of Beacon hill.

IDAHO.

IDAHO COUNTY.

Elk City says the first cleanup of the Hogan property, near there, resulted in five bars of gold worth \$13,000. The cleanup represents about six weeks' run with a 10-stamp mill crushing 3500 tons of ore a day. It represented 3500 tons of ore sent through the mill. Hogan expects that the gold will run \$16 an ounce. If it does, they figure that they have saved \$3.90 a ton on the plates. It is locally stated that the cost of mining and milling has been 60 cents a ton. Nine men, a cook and Superintendent Hogan himself are doing all the work of mining and milling eighty tons of rock a day. Counting out the superintendent, who is one of the owners, that means a payroll of less than \$35 a day. The property is worked by water power.

The Copper King M. Co., in the Seven Devils country, has seven claims. The

Copper King is the one on which the work was done. A crosscut tunnel has been run 200 feet. It cut a vein at 80 feet which was 10 feet between the walls. The lead carries gold and silver values.

The Macey M. Co., consisting of Spokane men, is operating extensively at Paradise Flat, putting in machinery for sinking and running a wagon road from the property to Black lake, 6 miles.

The Black M. Co., near Black lake, has completed a 10-stamp mill and an aerial tramway for a distance of 2000 feet.

The Rankin General M. & M. Co is operating a gold property adjoining the Copper King. The company is preparing to put in a patent process mill to treat gold ores. The patent process consists of manufacturing acid for treating ore with compressed air and electricity. The acid is formed by generating electric sparks in an air-tight tank. The company is opening a wagon road to bring in machinery.

G. Hancock, superintendent White Knob mines at Mackay, is driving a tunnel to connect with the main ore bodies. When this is done the new smelter will start.

G. M. McDowell, manager of the company operating at Mineral, says the smelter is ready. He says when it is started, and everything in running order, he will employ seventy-five men constantly.

OWYHEE COUNTY.

The Avalanche says that W. C. Orem and associates of Salt Lake City, Utah, have bonded the Fourth of July group of claims on War Eagle mountain.

The Poorman mill will start again next week. The test run recently finished resulted in a brick valued at \$3000. The old tables have been taken out and cotters substituted.

The face of the long tunnel at the Addie is in pay ore 15 inches wide and carries values of \$25.

SHOSHONE COUNTY.

The Silver Cliff M. Co. at its annual meeting at Wallace shows that 1600 feet of tunnel and shaft have been completed at a cost of \$8 per foot. Considering the hardness of the rock, this is a cheap, long tunnel. Considerable shipping ore has been taken out of the upper workings; at the present time are taking out shipping ore from the long lower tunnel; assets in cash and supplies \$1640.45, no liabilities. It is the purpose to continue the development work until a mine is made.

Wallace says a satisfactory agreement was reached at the meeting of the directors of the Frisco mine. Issuing bonds of \$100,000 to pay off the indebtedness was ordered, and immediate preparations are made for starting the mine. Eighteen months ago the company had a debt of \$150,000, of which \$100,000 was due on account of purchase of the Black Bear mine and the loss of \$50,000 in operation. A contract was made with the American S. & R. Co. by which the Frisco Co. was to receive \$18,000 per month for eight months. That allowed the company to reduce the debt to about \$80,000. On Jan. 1, 1902, a new agreement was made by which the mining company received \$6000 per month from the trust; but last July no contract was made and the mine was shut down. President Hyman has since then furnished money to keep water out of the workings. In addition to the money advanced, the president holds a mortgage of about \$61,500 against the property. That amount, with the back taxes and the money due the Mine Owners' Association, the debt of the company, is about \$80,000.

The Spokane M. & M. Co. has filed a plat of the town of Government, in Government gulch, near the Crown Point, Silver King, O. K. and other producing mines, 3 miles west of Wardner. At present the postoffice is called Silver King.

MICHIGAN.

HOUGHTON COUNTY.

The Baltic produced considerable heavy mass copper this month. One piece weighing 1400 pounds was raised.

The annual report of Mine Inspector Hall shows that 14,130 men are this year employed by the mining companies in Houghton county, as compared with 14,498 last year. Fatalities underground during the year numbered 4; surface, 4.

MONTANA.

DEER LODGE COUNTY.

The Boston & Seattle, a new company, will operate Ontario claims, near Elliston. The Potosi M. Co., organized several years ago to develop gold-bearing ore bodies adjacent to Gold creek, has resumed work on its property.

FERGUS COUNTY.

Lewistown says the Whiskey gulch cyaniding plant of the Central Montana Mines Co., in the Judith mountains, under the management of C. T. Durel, is run at a small expense—as low as 65 cents per

ton for treatment. The bulk of the ore is from the Myrtle basin, on the west side of the hill from the plant, distant about half a mile. About twenty tons of ore per day is received at the plant from the Spotted Horse mine. Considerable sacking ore is being received from that property this fall. Fifty men pre-employed, two shifts working in the mines and one in the mill; capacity, 225 tons per day; 100 tons only are being treated at present, but with the completion of development work the plant will be run full capacity. The ore is easy of cyanidization; less than one-quarter of a pound of cyanide is used to the ton. Arrangements are being made to utilize the steam from the exhaust pipe to heat the mill.

Lewistown says that since the transfer of the Great Northern mines to the Gold Reef M. Co. the payroll has increased to \$3000 a month. New ground is being opened up and the mill is being overhauled. The management believes that the black ore in the lower levels can be treated by the cyanide process after being subjected to roasting. The tanks are enlarged to double the mill capacity.

Near Lewistown J. H. Meredith, superintendent New Year's mines, says the drying screens, thought necessary to put in owing to the dampness of the ore, will not be placed until next spring.

FLATHEAD COUNTY.

Six miles from Cabinet, Theriault, Skellow & Scott own the Gold Leaf claim. They have cut the vein at six different places and from the several openings have made tests of the value of the ore, which is \$60 per ton. The ledge is 12 to 14 inches wide, the walls being slate.

GRANITE COUNTY.

D. T. Conkling and D. Arms are working the Maddix claim, under bond, an extension of the Sunday mine. The Montana G. Co., which operates the Sunday, has taken out \$50,000 since April. A station has been cut at the 120-foot level in the mine, and the company is now drifting both ways, with ore in the face of each tunnel. It is expected that a new mill will be put in.

JEFFERSON COUNTY.

Near Boulder the Eikhorn mine is again to be shut down. The mine has been on the verge of closing down two or three times in the past year, but favorable arrangements were made with the East Helena smelter to handle the ore and large shipments have been made. The expense of keeping the water down, however, and the low price of silver have made the owners' efforts to operate at a profit unavailing. Miners have been leaving there for the past two weeks and only a few are now left. The pumps are being drawn.

W. A. Clark has suspended operations on the Mayflower mine, near Whitehall. The property has been dismantled and the machinery is en route to Anaconda. The ore of the property was very rich in places, some of it being worth \$10,000 a ton, yet it did not look rich. The larger part of that mined by Mr. Clark yielded \$300 per ton. Mr. Clark took from the Mayflower about \$1,500,000 above expenses of operation, and it is claimed that there is still in the workings considerable ore that will run \$20 per ton, but the rich ore shoots are exhausted. Having his own smelter, Mr. Clark was able to treat the product at a minimum cost. One feature in the expense account was the fact that there was very little water to contend with.

The New Boston M. Co. has been organized to work the Mohawk, Snowbird and Badger claims near Corbin. H. Freyler of Corbin has been appointed manager of the property. He will sink 200 feet on the Badger and crosscut the vein, which is 8 feet wide, with 2 feet of ore on the hanging wall. The ore assays 7% copper, eleven ounces silver and \$2.50 gold.

LEWIS AND CLARKE COUNTY.

The Columbian G. M. Co., at York, whose mill and cyanide plant were totally destroyed by fire a short time ago, will erect a 500-ton plant if there is sufficient ore in sight by next spring. During the winter developing the property will be continued.

The cyaniding plant to work the tailings, dump and ores of the Empire mine, west of Marysville, is in operation. The mill, erected last year, has been rebuilt at an expense of \$16,000. It is estimated that there are 12,500 tons of tailings in the dump.

MEAGHER COUNTY.

W. W. McDowell, lessee and manager of the Daly copper mine at Copperopolis, says a crosscut is being run on the 400-foot level toward the ore body which was worked about the 300-foot level.

PARK COUNTY.

Near Livingston the property of the Emigrant Gulch G. M. Co.'s property—placer claims and equipment—is sold to

D. L. Wing of Peoria, Ill., and G. A. Winslow of Livingston for \$6000. Wing & Winslow will start work and spend considerable money developing them.

NEVADA.

EUREKA COUNTY.

Ore shipments by rail from the mines of Eureka district, for the week ending October 17, were as follows: Bullwhacker, 45,200 pounds; Eureka Con., 88,690; Jackson, 33,080. From Hamilton—Rocco-Homestake, 109,740.

ORMSBY COUNTY.

The Delaware mine is reported rebounded for \$50,000.

WASHOE COUNTY.

H. L. Cowles of New York, treasurer and general manager, and C. B. Hill of New York, president Pacific Con. M. Co. of Reno, have returned after inspecting the property and arranging a plan of work. Superintendent Parry has twenty men, but will increase to forty.

WHITE PINE COUNTY.

A double-compartment shaft is begun at Copper Flat this week, under the management of J. A. Taylor, to be used exclusively as a working shaft, through which the ore will be hoisted and transported to the smelter.

Erection of the New York & Nevada C. Co.'s smelter at the Keystone has begun.

NEW MEXICO.

BERNALILLO COUNTY.

C. Wessells of Philadelphia has a new method of lead smelting. A plant built upon his designs is to be erected at Aberdeen.

LINCOLN COUNTY.

The Old Abe mine at White Oaks, the South Homestake near the same place, the Helen Rae at Nogal, and the Parsons group on the Bonita, have been secured by the Eagle M. & D. Co., made up of Chicago and Iowa men. An electric plant is to be installed at White Oaks.

In the American mine at Nogal miners are at work in a body of ore which averages \$10 to the ton.

In the Jicarilla district activity is shown, the new mines are being developed and old ones reopened.

OREGON.

BAKER COUNTY.

A contract is to be let for machinery for a 100 H. P. electric plant for the Tempest mine in the Greenhorn district. Thirty-five men are employed at this property. They are now in ore.

Forty men are engaged by the Red Boy company in construction of the dam and other preliminary work at the Olive lake water system. The dam will be 460 feet long at the top, 20 feet wide, 50 feet high, 60 feet wide at the bottom. It will raise the water of Olive lake. Two plants have been discussed for the water power now being arranged; one a mile from the hoist. This would leave the 2000 H. P. for the market and place the plant to be used for the Red Boy properties in close touch with the machinery where the power is to be applied. This feature will be left open until actual work begins.

In the Uncle Sam property Superintendent Hawley has sunk on the vein. The property will be worked during the winter.

G. Rodgers, manager Tammany mine at Cracker creek, owned by the Northwest M. Co., will do some extensive tunneling this winter.

By final payment of \$10,000 the Virtue Con. M. Co. of Baker City acquires the Virginia Con. adjoining at a price of \$40,000.

HARNEY COUNTY.

A find of white diamonds is reported from the vicinity of Harney, but nothing definite as to extent or value is known.

JOSEPHINE COUNTY.

Sixteen miles east of Grants Pass C. E. Ray has 150 men building a dam across Rogue river.

T. W. Draper, manager Oregon & Pacific Railway Construction Co., says that within thirteen months Grants Pass and Crescent City, Cal., will be connected by rail, to give an outlet for the product of the copper mines of the Waldo S. & M. Co. The same people are connected with the O. P. R. C. Co. At Takilma the Waldo S. & M. Co. have men developing the properties. The new railroad will cross the road at Grants Pass. It will run across the Illinois valley of western Josephine, touching at Selma, Kerby and Waldo, cross the State line and follow Upper Smith river, in Del Norte county, Cal., almost to Crescent City.

LANE COUNTY.

The Mountain Lion is an extension of the LeRoy and Helena veins. At a depth of 165 feet the ledge is 10 feet in width, free-milling ore; 14 inches of galena ore assays \$34.60 per ton; new tunnel is being

started to tap the vein 125 feet below the level of the old tunnel. The Crystal Con. M. & M. Co. owns this property.

The Sweepstake mine on Elephant mountain, in the Bohemia district, has 1000 feet of development work. A tunnel has been run 400 feet, crosscutting has been done 300 feet. Some ore running \$5 to \$50 per ton has been struck.

MARION COUNTY.

T. C. Culbertson says gold deposits are discovered 11 miles northeast of Gates, on the Little North Fork of the Santiam river. Nine claims have been located by T. C. Culbertson of Portland, F. E. Slater and G. H. Irwin of Salem. The claims are 3 miles above Elk born postoffice.

PENNSYLVANIA.

LACKAWANNA COUNTY.

In the anthracite coal mines every miner has an assistant apprentice known as his laborer. It is the laborer's business to load the coal on the cars after the miner has blasted and dug it out of the rock. For every car of coal the company pays the miner about \$1.05 (the price varies slightly in different mines). From this amount 40 cents a car is deducted as pay for his laborer. The miner must provide his own blasting powder, which costs him about 75 cents a day, he must keep his tools oiled and in repair at an expense of about 25 cents a day. Six cars a day, or a shift, is about the maximum an average miner and his laborer can load in a day. So, according to that, the miner earns in ten hours:

Six cars at \$1.05 each.....	\$6.30
Less laborer's wages for six cars at 40 cents each.....	\$2.40
Less blasting powder.....	.75
Less tool repairs and sundries..	.25 3.40

Balance, the miner's day's pay..\$2.90

The miner asserts that because he has to spend so much time in building props and in working in thin veins, and because cars are not given to him as fast as he can dig out the coal, he cannot and does not load more than three cars a day, so that \$2.90 must be cut in two before it can be a true statement of what he actually receives for his day's work; \$1.45 for ten hours underground is his version. He adds that he receives \$1.45 a day for 200 days in the year.

SOUTH DAKOTA.

LAWRENCE COUNTY.

(Special Correspondence).—The grade of the 500-ton mill is nearing completion at Terry and timber work started. The same company are equipping a compressor plant in Montana. They are operating their own property for fluxes for the smelter, and siliceous ores for the smelter are furnished from their own properties. Terry, Oct. 16.

Lead reports that the Hidden Fortune M. Co. has been sacking on an average a ton of \$1000 ore daily for the last month on the Otto Grantz claims, in the siliceous measures, where the ore is mined by stripping and quarrying. Churn drill holes have been put down over a large area. The richest is a quartzite gangue, lying next to the quartzite floor, being a decomposed substance, in which the free gold is intermingled. The company expects to take out enough ore to pay for the Hidden Fortune group of 284 acres. The fifth crosscut has been driven from the Baltic tunnel in the vertical slates to the Bingham vein. This crosscut is 1700 feet from the entrance of the tunnel.

In most cyanide mills of the Black Hills the consumption of cyanide potassium per ton of ore is about one pound. At the Wasp No. 2 mill, under the superintendency of C. C. Griggs, the consumption is one-half pound per ton, the Wasp ore being free from anything which interferes with the action of cyanide.

PENNINGTON COUNTY.

(Special Correspondence).—The National Smelting Co., Rapid City, are making exceptionally clean slags and a good grade of matte. They are handling about 150 tons per day.

Rapid City, Oct. 16.

Rochford reports the organization of the Golden West M. & M. Co. P. Train is superintendent. Three hundred acres in the Hornblend district have been bought. The principal work is on the Yellow Bird and the Benedict group. The plan is to sink on the Benedict and the Yellow Bird and to block out ore, then to put up a 100-ton mill.

UTAH.

JUAB COUNTY.

Work on the properties of the Victor Co. at Tintic is suspended till the litigation with Boss Tweed over ore bodies has been settled.

SALT LAKE COUNTY.

The Bingham Bulletin says work on the

Mount Aetna group of twelve claims, resumed in August, will probably be continued all winter under the management of J. A. Kauffman. Present developments consist of about 500 feet of tunnels and inclines, \$5000 having been expended.

The United States tramway, main section, is completed.

A 500 to 600-ton addition to Bingham's daily output is a result of starting up the United States mines. The present mine force, about ninety, will be increased to 150.

At Bingham, the Morning Star, Frisco and Zelnora groups have been acquired by the Bingham & New Haven C. & G. M. Co. They will drive the Morning Star tunnel, which has been driven 600 feet, to tap the main ledge at a depth of 500 feet below its apex, and continue from that station to tap the main Zelnora ledge at a depth of 900 feet.

The Highland Boy smelter has produced since October 1 nearly 1,500,000 pounds of copper bullion. It is thought that the Highland Boy management may come on the market for siliceous ores, as the excess in iron in the product coming from its own mines would enable the company to treat profitably outside ores such as those in the Tintic district.

The American S. & R. Co.'s Germania plant in this valley will be put out of commission about November 1. The new \$1,000,000 smelter is being got in shape for operation. The daily capacity of its equipment of furnaces is enough to handle all the ores now coming there.

SUMMIT COUNTY.

While sinking for water in Cherry Creek canyon the man in charge broke into a copper-bearing placer. A sample of the copper-bearing sands at Salt Lake shows the copper in native state. A mile east of the hole through which the placer was tapped R. McMichaels is developing a ledge in the sandstone, 4 feet between the walls, from which he is extracting ores 20% copper, 19 ounces silver.

From a 10-foot breast of ore in an upraise in the California M. Co.'s property at Park City, samples assay 40% lead and twenty ounces silver; \$5.60 gold per ton.

TOOELE COUNTY.

The tunnel by which the properties of the Honerline Co. and neighboring territory at Stockton is to be drained is in 1500 feet.

WASHINGTON COUNTY.

Near St. George, Manager G. Snyder of the Utah & Eastern Co. says the new smelter will be built as soon as materials and machinery can be hauled and mechanics can put it together.

WASHINGTON.

FERRY COUNTY.

Republic mine owners have offers to treat the ore from Tacoma and Vancouver. Mr. Breen of the Vancouver smelter offers to take 1000 tons of Republic ores per month at \$8 per ton freight and treatment.

W. R. Rust of the Tacoma Smelting Co. is figuring on getting a \$5 freight rate from Republic to Tacoma. If he can get this he will be willing to smelt the low-grade ore from Republic for \$2 per ton. This would apply only to ore carrying over 90% silica, as he would wish to use it for converter linings. If satisfactory arrangements can be made, he could use from 200 to 300 tons per month of this kind of ore. This would mean a \$7 freight and smelting charge. The rate offered by the Tacoma smelter is but 50 cents more per ton than the freight and treatment rate to the Granby smelter.

At Republic the Qulp mine has resumed operations under the superintendency of Robert Angus. It will break ore for shipment. There are between 125 and 150 miners at work in Republic. There are fifteen properties employing men.

OKANOGAN COUNTY.

A. M. Wehe is general manager of the Favorite G. & C. M. Co., to work ten claims on Ellemeham mountain, including the Roanoke property. The company will start a tunnel near the base of the mountain and run it 4000 feet to cut the ledges.

SKAGIT COUNTY.

The main tunnel of the Great Excelsior, in the Mount Baker district, near Hamilton, is in 285 feet. Fifteen additional stamps will be put in.

SNOHOMISH COUNTY.

The Hydro-Smelting & Refining Co. is erecting a 50-ton copper matting plant at Edmunds. The process involves the creation by the use of crude oil of carbon.

STEVENS COUNTY.

The Northport smelter is closed down—lack of coke.

WYOMING.

UINTA COUNTY.

Evanston says from the Ellis oil well on section 22, 5 miles from Spring valley, forty-five barrels of the high-grade oil were taken, and that the well refilled immediately 700 feet. The depth of the well is 1200 feet.

FOREIGN.

AUSTRIA.

The mercury mines are situated at Idria, in the Province of Carniola, and are a government undertaking. They have been worked upwards of 300 years, the third century having been completed in the year 1880. About 1200 workmen are in regular employment. The working day consists of eight hours if in the mine and ten hours if outside. The mine produces annually about 800,000 quintals of raw material. Three blast furnaces exist. Five thousand quintals of pure commercial mercury is produced, and 460 quintals of vermillion, per annum. The total revenue in 1870 rose to 2,000,000 florins, but in 1880 it fell to 385,000 florins. The latest statistics have not been published. From paragraphs that have appeared in the local newspapers it would seem that the mines are not working quite satisfactorily, and there is some talk of closing the works. Mercury has recently been discovered at Spizsa, in Dalmatia.

BRITISH COLUMBIA.

Shipments from the Rossland camp for the week ending October 18th and for the year to date are as follows:

	Week.	Year.
Le Roi.....	4,660	181,376
Le Roi No. 2.....	545	51,596
Centre Star.....	1,800	17,181
War Eagle.....	1,290	9,336
Rossland G. W.....	...	2,400
Giant.....	30	2,605
Cascade.....	...	300
Columbia-Kootenay.....	...	30
Bonanza.....	...	90
Velvet.....	60	860
Spitzee.....	...	20
White Bear.....	...	5
Totals.....	8,285	265,599

It is reported in Nelson that the erection there of a large lead refinery has been decided on by the C. P. R. R.

A shipment of about 5600 pounds of pig lead, the product of the silver-lead refinery recently installed in connection with the Trail smelter, has been laid down at Grand Forks at a total cost of 5½ cents per pound.

Grading is being done at Morrissey for the erection of 250 new coke ovens. Forty men are employed, to be increased to 100.

The Le Roi company has made a reduction in the cost of mining operations there. Manager John MacKenzie reports:

"The expenditure for the month on mine account was \$54,187. The cost per ton of breaking and delivering the ore on the railroad cars was \$2.40, a reduction of 47 cents, as compared with July. The cost of development including the deepening of the main shaft, was 74 cents, making the total cost of mining and exploration equal to \$3.14 per ton."

Shipments of first-class ore were 17,010 tons, averaging \$15, and 1568 tons of second-class ore from the dump, going \$11.81.

Fairview reports work on the 200-ton cyanide plant of the New Fairview Corporation, Ltd., progressing. Superintendent Ostenberg figures that he will save 88% of the value in the tailings when everything is ready to put in operation the 46-stamp mill and cyanide plant and there will be ore for crushing. There are now 6000 tons of broken ore in the stopes. At present one drill is sufficient to keep fourteen stamps running.

A two weeks' test, with fourteen stamps, on ore from the 300 level, gave the following returns: One hundred and sixty-eight ounces bullion, \$1630; 5 tons sulphurets, value per ton \$211, \$1055; 50 tons low grade concentrates, value per ton \$18, \$900; 600 tons tailings, value per ton \$3.70, \$2220; total, \$5805, giving a value of \$8.50 per ton. In addition to these values, about 10% was lost by being carried off in the slimes. A second run of ore from the same level of 846 tons and 454 tons from the second level, or a total of 1300 tons milled, resulted as follows: One hundred and thirty-seven and one-half ounces bullion, value \$1557.87; 7 tons sulphurets, value \$145 per ton, \$1015; 60 tons low-grade sulphurets, value per ton \$15.95, \$957; 1100 tons tailings, value per ton \$2.80, \$3080; total, \$6619.87, showing an average value of \$5.07 per ton in addition to slime losses.

Ymir reports the stamp mill and cyanide plant at the Second Relief running. Twenty-five men are employed.

Boundary mines are shipping ore at the rate of 1800 tons per day. The following

is the tonnage of the six leading mines for the week:

Granby mines, 5236 tons; Mother Lode, 4576 tons; Snowshoe, 1080 tons; Sunset, 610 tons; B. C. mine, 600 tons; Emma, 780 tons; total for the week, 12,888 tons. Total for the year to date, 372,377 tons.

On the Highland group, near Ainsworth, the mine has been leased to H. Cortiana, who has thirty-five Italians at work. The concentrator was started up this week.

LOWER CALIFORNIA.

W. F. McAboy, manager Thomas M. Co., has loaded barges at Yuma, Ariz., and goes down to the company's property, 150 miles from there. Several carloads of ore will be taken out and in thirty days the steamer Retta will go down after it. The company has a smelter at Redondo, where a test will be made of the ore.

MEXICO.

In a recent official report to the Mexican Government by Juan Fenochio, comandante third zone, La Gendarmeria Fiscal, regarding La Cananea, he says the principal mines now being worked are the Esperanza, Copete, Oversight, Veta Grande and Eliza, in which there are engaged 1187 men earning an average of \$3.50 gold daily. [This does not, of course, represent the actual wages of miners or laborers, because in the above average are included the salaries of the civil and mechanical engineers and other employees of more or less rank, and others holding high positions.]

For the extraction of ore and the working of these mines the following machinery is used: One 210 H. P. engine, five 44 H. P. gasoline hoists, six 44 H. P. steam hoists, two 110 H. P. steam hoists.

In addition to the mining operations there are employed in the other departments and offices, in the construction of new buildings, erection of new machinery, railroad service, etc., 2736 men, whose average daily wage is \$5 Mexican money. Among the 3925 employees above mentioned the following nationalities are represented: Mexicans, 2121 (54%); Americans, 1265 (32%); English, 132; Scotch, 17; Irish, 52; Canadians, 5; Germans, 62; Swedes, 22; French, 17; Italians, 17; Swiss, 2; Russians, 8; Chinese, 189; other countries, 14; total, 3925.

The smelter has at present six furnaces in active operation, reducing 1200 tons of ore every twenty-four hours and producing about seventy-five tons of fine copper. In this department and its annex are employed 1250 men, earning an average wage of \$5 Mexican silver for each eight hours of work, there being three shifts every twenty-four hours, and the same rule prevails in all departments in which the work never ceases.

The coke consumed by this department is imported from the United States, coming from the State of Colorado and Indian Territory; its cost at the smelter is \$23.30, Mexican money, per ton.

The steam power used in the smelter represents a total of 4500 H. P.

The ore concentrated comes from 2% to 4% of copper, and the concentrates assay from 30% to 40%.

At present but 750 tons are concentrated daily, using 350 steam H. P., but this department is as yet unfinished and is being rapidly enlarged.

The new power house contains several large engines employed in generating electric power for the cars which carry the slag to the dump, for light for the other buildings and the mining camp, as well as for motive power for the mud mill and the machine shops, and for the brick-making machine, generating a force of about 750 H. P. with a current of about 250 volts.

The main railroad line is of standard gauge, commencing at Naco, where it connects with the El Paso & Southwestern Railroad, passes through La Mesa and El Ronquillo and terminates at Los Puertecitos, where the same company has mines under development.

The Guggenheims are locally credited with having secured options on all the mines around Parral, Mex. It is reported that they control the importation of gold and exchange throughout the republic. It is reported options were secured in connection with a scheme in which the coinage of \$50,000,000 worth of silver will form a part.

SONORA.

C. H. Saunders is manager Gold Treasury Mines Co., Naco. Twenty stamps are being put in. The camp is 45 miles from La Cananea.

Cananea reports that Mexican troops or district police have taken possession of a group of copper mines, purchased some months ago by the Copper Queen Co. from Taggart, Morse, Jamison and others of Indianapolis. L. Lindsay secured a judgment from the court of first instance of Sonora, Mex., against the Indianapolis claimants on account of the alleged failure

to carry out a contract. The Queen Co. refused to give possession, hence the action of the troops. There were 150 men working and possession was given the soldiers without resistance. The mines are in the heart of the Cananea copper fields and embrace 250 acres; 7000 feet are under development. Lindsay is now in possession.

P. E. Murray, manager Zubiate mines, says the big stamp mill was burned on the 15th inst., loss estimated at \$60,000. D. R. Oliver, of San Francisco, is president of the company. It is thought a new mill will be built.

SOUTH AFRICA.

At Johannesburg the mines are nearly all running, but not to their full capacity, because native labor is so scarce. The mines have employed quite a number of ex-soldiers and pay them \$1.25 per day and board. At present the country is overcrowded with laborers, that is white laborers. But skilled labor commands the old prices.

THE KLONDIKE.

The Lewis River M. & D. Co. has moved down to Bonanza creek the dredger that was first used on the Cassiar bar, upper Yukon. At the Cassiar bar it was not a success, owing to the fact that the gold at that place seemed to be on the surface only, but at Dawson, when floated, such excellent results have been accomplished under the management of Mr. Elmer, that they intend to place a similar dredger at 16 Eldorado. In the Stewart River district, ex-Commissioner Ogilvie has been operating a dredger in the Stewart district this summer and he, too, will bring in another next year. Prospectors have been working from the headwaters of the Stewart to the Rocky mountains. In the last month three strikes have been made in the foothills of the Rockies and a large number of locations filed. Below Dawson, Wilson & Barrett are running a 250-foot tunnel to cut a ledge of galena on their claims. Bourden & Robinson have a 50-foot shaft on their Violet ledge and bonded the group to Eastern capitalists. The mill tests show \$3 in free gold and \$4 in concentrates.

About the Lapine and Rock Creek groups gold bearing quartz has been discovered. The Ladue Co. has bonded the Lapine property; a tunnel is being run into the ledge. Assays show gold values of \$8 a ton.

Personal.

F. G. MOODY has returned from Mexico to Salt Lake City.

M. PAQUIN has charge of the Bins M. Co., Ouray, Colorado.

ROBT. MEIN has returned from Nevada county to Oakland, Cal.

A. DYATT is in charge Toledo Avenue property, Leadville, Colo.

J. F. PARKS has returned to Jackson, Cal., from San Francisco.

A. J. MALLOY will develop the Paymaster group, St. George, Utah.

A. G. LAMSON has returned to Salt Lake City, Utah, from the East.

SAMUEL NEWHOUSE has returned from Europe to Salt Lake City, Utah.

J. B. TOMLINSON has returned to Prescott, Arizona, from a Sonora trip.

D. CLARK is general manager Waterloo Con. M. Co., Camp McKinney, B. C.

L. BINDER is superintendent Province & Del Oro G. M. Co., Zitacuaro, Mexico.

CHAS. WRIGHT is superintendent Central Montana M. Co., Lewistown, Montana.

WM. SCHWARTZ is general manager Santa Cruz M. Co., near Patagonia, Arizona.

F. E. WADE is superintendent the Globe Mining Company, Terry, South Dakota.

E. B. GAGE, president Tombstone Con. M. Co., Tombstone, Arizona, is in San Francisco.

F. GRAHAM is superintendent and manager Pride M. Co.'s properties, Montezuma, Colo.

H. W. TURNER is now manager Cherry Hill Gold Mines, Cherry Hill, Siskiyou county, Cal.

J. JOLLY has been appointed foreman Green Mountain Copper Co., Cripple Creek, Colo.

L. A. DURHAM, manager Clifton Con. M. Co., Clifton, Ariz., is visiting Salt Lake smelting plants.

C. G. LYNCH, manager Blinn Lumber Co., has returned from Clifton, Ariz., to Los Angeles, Cal.

I. M. BENEDICT, of Cripple Creek, Colo., will be superintendent the new Bingham & New Haven Copper & Gold

Mining Company, which has acquired the Morning Star, Zeinora and Frisco groups, Bingham, Utah.

J. F. BRADLEY, superintendent Halifax M. Co., has returned to Butler, Nevada, from Salt Lake, Utah.

A. J. BETTLES, general manager Newhouse interests, Utah, has returned to Salt Lake from Denver.

MARK B. KERR, general manager Jumper mine, has returned to Stent, Cal., from San Francisco.

W. H. SHOCKLEY, formerly superintendent Mount Diablo M. Co., Candelaria, Nevada, is at Tonopah, Nev.

J. S. DOUGLAS, superintendent Montezuma Cooper Company, has returned from the East to Nacozari, Mexico.

GEORGE H. KIRSCH, from Bisbee, Ariz., is in San Francisco for a brief time, and will return to Naco, Sonora, Mexico.

T. B. EVERETT, formerly of Placer county, Cal., is now interested in mining operations in Humboldt county, Nev.

F. H. PROBERT, who had been examining the Old Dominion property, has returned from Globe, Ariz., to Los Angeles, Cal.

W. H. NICHOLLS, president Nicholls Chemical Company, New York, has returned from a visit to Granby smelter, B. C.

J. CHYNOWETH, superintendent Fay group of mines, is appointed permanent superintendent of the Trimountain, Houghton, Mich.

J. R. JOHNS former manager Mollie mine, Aspen, Colorado, is in charge at the Mineral Farm mine, Smuggler mountain, Pitkin county, Colo.

E. H. BENSON, superintendent Black Warrior Copper Company Amalgamated, has returned to Globe, Arizona, from North Weymouth, Mass.

A. VAN DER NAILLEN JR. is appointed Commissioner of Public Works of San Francisco, to fill the vacancy caused by the death of G. H. Mendell.

F. J. CAMPBELL, manager Golden Cycle mine, has recently returned to Denver, Colo., from Europe, where he has been the past five months.

JAS. A. KERR, of the Kerr-Roberts Development Company, operating the Mammoth tunnel, has returned from Kansas City, to Idaho Springs, Colo.

F. KLEPETKO left New York for Peru on the 14th inst. He had been ill since leaving Montana en route to Peru, and, after two months' delay, took his doctor with him.

F. B. YOUNG, of Denver, succeeds T. B. Beadle as mill foreman Central Montana M. Co., Lewistown, Montana. The latter takes a like position with the Gold Reef M. Co.

F. K. BORROW has resigned his position of assistant manager of Contention mine, near Telluride, Colo., and goes to London, thence to South Africa, where a position awaits him.

H. SMITH, former superintendent of the Bullion-Beck mine, and later of the Centennial Eureka, Tintic, Utah, is at Tonopah, Nevada, and has charge of the Acenth mine.

C. E. UREN of the Eagle-Shawmut mine has returned to Tuolumne county, Cal., from Angela, where he had been making surveys of the Utica mine for use in the Lightner-Utica suit.

U. S. SENATOR PETTIGREW, of South Dakota, and U. S. Senator Butler, of North Carolina, are visiting the Cal. King G. M. Co.'s property at Picacho, Cal. The former is president of the company.

C. H. REPATH has resigned as chief engineer at the Washoe smelter, Anaconda, Mont. He will go to New York and engage in work for which he has been selected by F. Klepetko, manager Haggis-McCune smelting interests, Peru, S. A.

E. W. WILLIAMS, of the Speckle Payment, Idaho Springs, Colo., has returned from England, where he arranged with the directors of the Kohinoor-Donaldson company to resume operations on the Champion mine on Bellevue mountain and the Donaldson mine on Clear Creek, near Fall River, Colo.

Obituary.

COLONEL GEORGE H. MENDELL, president of the Board of Public Works of San Francisco, died in that city on the 19th inst. He was a native of Pennsylvania, born in 1831; entered West Point College in 1848, graduating four years later. During the civil war he served as topographical engineer on General Miles' staff, and later carried on the siege before Petersburg. He was retired from the army in 1895 by the age limit, and since 1900 served in a municipal capacity.

What the California Miners' Association Has Done—1892 to 1902.

Even those familiar from the beginning with the origin and ten years' labor of the California Miners' Association are apt to forget a good deal of the truth and fact of its history; to fail to appreciate its elements of strength, its value to the mining interests of the whole State—yes, to the entire Pacific coast—and its past successes. They are apt to also fail to realize the fact that its future career is bound to see an expansion and an increase of strength and activity proportionate to the wonderful growth and prosperity that we all feel is coming fast, not only to our own great industry here in California, but to the entire commonwealth of California. This State suddenly awakes to find itself fairly in the center of a great movement that is making the Pacific the main theater of the world's activity, and to a faith that it feels the beginning of a growth in population, prosperity and enterprise but vaguely dreamed of yesterday.

The mining industry is feeling a new thrill of life along with all other industries, and is partaking of the general spirit of enterprise and faith in the future. After a long time of tribulation and disaster, a great day is dawning here, and the California Miners' Association must be one of the great forces at work in that day.

The mining interests of every mining county owe loyal support to the banded miners of the State for two classes of reasons. There are the direct benefits, affording purely selfish reasons, and they should be strong ones, not only to the miner, but to every resident of a county in which mining is the chief industry. We are interested in the preservation of what hydraulic mining has so far won, and in the further aid that it will surely get, if strong and united efforts are continued. We are interested in saving to the largest industrial interest the mineral lands that mean a great deal to our future, and for the preservation and protection of which the California Miners' Association is persistently battling. We are interested in the land and mining rulings of the Interior Department, and our associated committees, when strongly backed by influence and prestige, are the strongest defenders you can find when oppressive rulings are made. We are interested in amending the federal mining law, and when it is amended the California Miners' Association will cut a big figure in the process. We are interested in any mining laws that the Legislature may pass. This Association has greater influence at Sacramento in this field than any political boss. We are and will be interested in many other things which the California Miners' Association will be potent to secure or regulate.

The questions are often asked: "What has the Association accomplished?" In answer it can be said: It secured the passage of the Caminetti act, under which over 400 licenses have been granted, permitting mines to work which otherwise would have remained idle.

It has secured an appropriation of \$800,000 from the Federal and State Governments to build dams to hold back debris in the Yuba river, to prevent the inundation of the valleys and the cities adjacent thereto.

It has protested against and prevented the patenting of millions of acres of land to the land-grant railroads, until the character of the land can be determined by an impartial jury.

It has secured the passage of many amendments to mining laws, and the enacting of new laws benefiting the mineral industry, and has used its influence to prevent the enactment of laws detrimental to the industry.

It was the first organization in America to urge the creation of a Department of Mines and Mining, with a secretary who shall be a member of the President's Cabinet, and it proposes to urge this matter until the department is established.

It collected and installed comprehensive mineral exhibits on the occasions of three great expositions, to-wit: The California Midwinter International Exposition, 1893-4; the Golden Jubilee Mining Fair in 1898, and the Paris Exposition, 1900. The first two were directly in charge of the agents of the Association, and were the means of directing vast amounts of capital to this State, and reviving the mining industry, which at that time was in a very stagnant condition. The Paris Exposition was encouraged and stimulated by the Association, inasmuch as the State appropriation was raised \$10,000 by the efforts of its officers, to aid the mineral exhibit.

It brought across the continent and royally entertained the members of the American Institute of Mining Engineers in 1899, and at that time published a volume, "California Mines and Minerals." These

two efforts of the Association alone have been the means of directing the investment of a large amount of capital in California, in several instances the investment being made through the officers of the Association.

It was the first to bring to light and agitate the great questions of the conservation and storage of flood waters, a movement that has stirred the nation with its magnitude, and which has resulted in the formation of many societies and organizations for this purpose.

It has published and spread broadcast over the entire English-speaking world, literature advertising the great mineral wealth of this glorious State, and it will continue to do so as long as the necessity for such literature remains and the people support the Association.

Its officers and committeemen have worked untiringly and incessantly for the benefit of the industry, and all for public spirited reasons, as not one of the officers or committeemen ever received a dollar for his services until two years ago, when a salary was voted to the secretary. It is for this reason that the California Miners' Association deserves the support and endorsement of every miner and mining man in this State.

The Association has had over 9000 members in the past. It should have 20,000 in the future—every one interested in mining and every miner in the State should be willing to contribute \$1 annually to an organization that is constantly and unselfishly working to promote the interests of the first and greatest industry in the State.

A statement of the finances of the Association for ten years, 1892 to 1901, inclusive, may be of interest to members—and is herewith given—in order that subscribers and members may judge if their money is being properly expended:

RECEIPTS.

San Francisco — general subscriptions	\$18,763 56
San Francisco — "California Mines and Minerals"	5,930 95

Respectfully,
EDWARD H. BENJAMIN, Secretary.
San Francisco, Cal., Oct. 23, 1902.

Catalogues Received.

Catalogue No. 34 of the F. M. Davis Iron Works Co., Denver, Colo., is devoted to mining and milling machinery. The Davis standard crushing rolls are illustrated and described in detail, as are the Davis sampling rolls. There are several pages of scale drawings of Davis standard rolls, with full instructions for erecting them. The treatise will be sent to any address.

Mineral Statistics for 1901.

The annual volume on the mineral resources of the United States for 1901, prepared by Dr. David T. Day of the Geological Survey, has been sent to press and will be issued soon. An interesting feature of the report is a compilation of statistics, showing the number of working days lost in strikes in the coal industry. These figures include the present year and are brought up to date. The total number of days lost for the present year is placed at 2,000,000 days, compared with 733,802 days in 1901; 4,878,102 days in 1900 and 2,124,154 days in 1899.

The report places the total mineral product of the country for the year at \$1,086,529,521, a gain of a little more than 2% over the production of 1900. The gain was made in the non-metallic products and amounted to \$55,065,882, against a loss of \$32,156,909 in the metallic products.

As heretofore, iron and coal are shown to be the most important of our mineral products. The value of iron in 1901 was \$242,174,000, as compared with \$259,944,000 in 1900, and the value of coal was \$348,910,469, as compared with \$306,671,364 in 1900.

The value of fuels increased from \$406,359,351 in 1900 to \$442,395,304 in 1901, a gain of almost 9%. Every variety of fuel increased in value except petroleum, which showed an increase in quantity of 5,778,675 barrels, but a decline in value of \$9,571,978, due largely, the report states, to the less valuable character of the increased product of the new petroleum fields, as compared with the older fields.

Anthracite coal increased 9,021,207 long tons in output and \$26,746,169 in value. The average price of anthracite coal per ton at the mine was \$2.05—the highest figure obtained since 1899—and the average price per ton for bituminous coal at the mine was \$1.05—about 1 cent per ton more than in 1900.

Commercial Paragraphs.

THE Mine & Smelter Supply Co. of Denver, Colo., have orders for thirteen DeRemer water wheels in sizes of 4 feet, 5 feet and 6 feet.

THE Colorado Iron Works Co. of Denver, Colo., report the sale of a 40-stamp gold mill, erected complete for operation, to the Mojave G. M. Co., Needles, Cal.

J. W. COPELAND, Denver, Colo., has been appointed agent for Colorado for Wm. B. Scaife & Sons, Pittsburgh, manufacturers of the Scaife & We-Fu-Gu water softening and purifying system.

THE J. H. Montgomery Machinery Co. of Denver, Colo., have the following orders for machinery and supplies: Sixteen hundred feet surface gravity tramway for the British Columbia Gold Field, Ltd., Frank, Alberto Province, Canada; one carload of ore cars and automatic engine for the Stanley gold mine, Ketchum, Idaho; one carload of coal cars for Cedar Hill Coal Co., Rugby, Colo.; two carloads pipe line for the Highland Valley Power Co., Boise, Idaho, and a 50-ton cyanide plant for Leadville, Colo.

DURING the past few years there has been a number of plans evolved to prevent belts slipping on the pulleys. A successful one comes from Denver, Colo. The Hercules Pulley Covering Co., of that city, have the novel plan of covering the pulleys with a preparation of cement and thin layers of prepared paper, and it is stated, they are meeting with a ready sale and that the covering is doing more than they anticipated. The preparation is easy to put on smooth and is claimed to be harmless to either belt or pulley, not affected by either heat, cold, grease or steam.

THE S. H. Supply Co. of Denver, Colo., have made and occupy a position peculiarly their own in the handling of slightly used mining and milling machinery. One hundred and twenty-nine carloads of milling machinery from the Cripple Creek district since the first of the year from plants which are known to have been in operation from three months to a year; twenty-nine carloads now en route from Aspen, consisting of pumping, hoisting and air compressing plants which have been in actual operation from one to three years, secured from such mines as the Free Silver, started in 1897, the deep shaft, with its enormous Corliss hoist and duplex condensing pumps capable of 1000 gallons per minute 1000 feet high; nine air compressing plants, electrically and steam driven, with their full complement of drills, receivers and pipe, certainly illustrate the magnitude of their operations.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING OCTOBER 14, 1902.
711,061.—**FLOW-J** W. Barnes, S. F.
711,379.—**FISH TRAP**—P. M. Benseth, Fairhaven, Wash.
710,949.—**SODA FOUNTAIN**—E. J. Calley, Oakland, Cal.
711,098.—**WAGON JACK**—G. J. Carr, Oroville, Cal.
711,259.—**STEAM GENERATOR**—L. D. Copeland, Los Angeles, Cal.
711,260.—**STEAM GENERATOR**—L. D. Copeland, Los Angeles, Cal.
711,261.—**STEAM GENERATOR**—L. D. Copeland, Los Angeles, Cal.
711,042.—**EXTENSION TABLE**—S. Dusenberry, S. F.
711,102.—**ROCK DRILL**—A. D. Foote, Grass Valley, Cal.
711,497.—**SAVING GOLD, ETC.**—F. M. Graham, San Jose, Cal.
711,157.—**HARVESTER**—G. W. Haines, Stockton, Cal.
710,981.—**SEPARATOR**—R. W. Jessup, S. F.
710,982.—**SEPARATOR**—R. W. Jessup, S. F.
710,983.—**SEPARATOR**—R. W. Jessup, S. F.
711,113.—**GAS COOKS**—A. E. Kraeger, S. F.
711,063.—**VISES**—McMahon & Lindgren, Spokane, Wash.
711,331.—**SLAG STEAM GENERATOR**—G. Mitchell, Naco, Ariz.
711,332.—**SLAG STEAM GENERATOR**—G. Mitchell, Naco, Ariz.
711,333.—**SLAG STEAM GENERATOR**—G. Mitchell, Naco, Ariz.
711,294.—**POULTRY FOUNTAIN**—F. Pohley, Windsor, Cal.
711,076.—**HYDRAULIC RAM**—J. Richards, S. F.
711,079.—**CHECK BLOCKER**—F. W. Smith, Campbell, Cal.
711,359.—**WOOD COUNTER**—T. A. Smith, Azusa, Cal.
711,453.—**TELEPHONES**—W. F. Smith, S. F.
711,135.—**WATER CLOSET**—J. Stewart, Los Angeles, Cal.
711,088.—**POTATO PACKING**—R. P. Vivian, Los Angeles, Cal.
711,144.—**MEASURING APPARATUS**—A. C. Wright, Berkeley, Cal.
711,450.—**WIRE FASTENER**—G. H. Wright, Spokane, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HARVESTER—No. 711,157. Oct. 14, 1902. G. W. Haines, Stockton, Cal., assigned to the Houser & Haines Manufacturing Co., a corporation of Stockton, Cal. The purpose of this invention is to improve what are commonly known as "two-wheel" sidehill harvesters. The improvement consists in a method for raising either one of the driving wheels, as desired, and at the same time lowering the other one by means of long screws so connected with the axles of the driving wheels that said wheels can be adjusted at any desired height and held there. In this construction there is no need for the least possible waivable to the machine; it is staunch, perfectly adjustable and in every sense practical.

FLOW—No. 711,091. Oct. 14, 1902. J. W. Barnes, San Francisco, Cal. This invention consists in a flow, the combination of a moldboard having a groove along its lower edge, and a reversible share having symmetrically concaved sides, pointed ends, and a tongue on one edge of lesser length than the share, said tongue adapted to fit and lock in said groove.

WAGON JACK—No. 711,098. Oct. 14, 1902. G. J. Carr, Oroville, Cal., one-half assigned to Geo. M. Sparks, same place. The object of this invention is to provide a portable apparatus of simple construction by which the four wheels may be lifted simultaneously from the ground for purposes of washing, greasing, painting, repairing, etc. It consists of a wheeled base including longitudinal and cross bars; rock shafts journaled across opposite ends of the base and having their ends bent at right angles to form arms, a wagon-supporting frame carried by the arms, said arms at one end of the base being longer than those at the other end of said base; a centrally disposed lever fulcrumed at one end to one of said rock shafts; and links secured to the lever at a point between the fulcrum and outer end, said links diverging towards the sides of the wagon-supporting frame and secured to said frame at a point between the rock shafts.

POULTRY DRINKING FOUNTAIN—No. 711,224. Oct. 14, 1902. F. Pohley, Windsor, Cal. This invention consists in the combination in a poultry fountain of a horizontal tubular closed reservoir, hangers by which it may be removably attached to the upper part of a crate, and a reservoir parallel with and at a distance beneath the upper one, a water pipe extending from the bottom of the upper reservoir to a point beneath the surface of the water in the lower one, an air pipe extending from approximately the water level of the lower reservoir to the upper part of the upper one, the drinking openings in the upper part of the lower reservoir, said openings not extending to the ends of the reservoir where said ends form cup-shaped receptacles substantially as herein described.

ROCK DRILLS—No. 711,102. Oct. 14, 1902. A. D. Foote, Grass Valley, Cal. This invention consists essentially in a means for revolving rock drills by the action of an elastic medium therebetween. It consists in a novel arrangement of inlet and exhaust valves located close to the ends of the cylinder in which the piston of the drill reciprocates, and a means for opening and closing said valves by the movement of the piston transmitted directly to the valves and without exterior mechanism.

ATTACHMENTS FOR GAS COCKS—No. 711,113. Oct. 14, 1902. A. E. Kraeger, San Francisco, Cal. The object of this invention is to provide a simple and positive means for cutting off the gas when it is desired to extinguish the light. It consists in the combination of a gas cock, of a ratchet wheel fixedly connected therewith, a sleeve in which the plug is turnable, means for holding the sleeve stationary a spring pressed pawl pivoted on the sleeve, said pawl having one end adapted to engage the teeth on said ratchet wheel, means upon the other end of the pawl by which it may be operated to release the ratchet, and a spring having one end secured to a fixed point and the other end secured to the ratchet, said spring tending always to rotate the plug to close the cock.

Latest Market Reports.

SAN FRANCISCO, Oct. 24, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 50½c, refined (1000 fine); San Francisco, 50½c; Mexican dollars, 44c San Francisco, 40c New York.

COPPER.—New York: Standard, \$10.65@11.00; Lake, 1 to 3 casks, \$11.55; carload lots, \$11.15; Electrolytic, 1 to 3 casks, \$11.50; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.50; carload lots, \$11.25. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £53 5s 6d spot per ton.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 15s per ton.

SPELTER.—New York, \$5.50; St. Louis, \$4.50; London, £19 5s 0d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$26.25; San Francisco, ton lots, 27c; 1000 lbs., 28c; 500 lbs., 28½c; 200 lbs., 29c; less, 30c; bar tin, \$3.10, 32½c. London, £119 5s spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 per flask of 76½ lbs.; Denver, \$49.75. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

NICKEL.—New York, 50@60c per lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.50; gray forge, \$20.00; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$31 and \$31.50; open hearth billets, \$33 and \$34.50; San Francisco, bar, 7c to 12c per lb.

Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$5.50; 5x, \$5; Lion, \$2, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c per set; 14 oz., 40s., 9½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.50; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 27@28c per lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; red sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3½@3¾c; California refined, 2@2½c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.25 @1.50 per 100 lbs.; sks, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c per lb.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; lard oil, 55c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs., 25c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., 95c; cs., \$1.05; Neats-foot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 52½@55c; cs., 57½@60c; Sperm, crude, 60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Suhnitrate, per lb., \$1.60.

BONE ASH.—4c per lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 60c.

MANGANESE.—(90% and over) per lb., \$1.25.

MERCURY.—Bichloride, per lb., 90c.

MOLYBDENUM.—25c. 3 grammes; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) per lb., 80c.

SILVER.—Chloride, per oz., 75c; nitrate, 55c.

SODIUM.—Metal, per lb., \$1.00.

URANIUM.—Oxide, per lb., \$3.50.

ZINC.—Metallic, chemically pure, per lb., 50c.

ZINC.—Dust, per lb., 10c.

ZINC.—Sulphate, per lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

WANTED.—A man thoroughly familiar with the reduction of quicksilver ores, to take entire charge of mines and furnaces. Address, giving references, "Quicksilver," care of Mining and Scientific Press, 330 Market St., San Francisco, Cal.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine hydraulic process from Sidney S. Sturman, in Mamaluke Hill Mine, near Georgetown, El Dorado County, Cal., draining into Cannon Creek which reaches American River; from Peter S. Inneson, in Crystal Springs Gravel Mine, near Igo, Shasta County, Cal., draining into Clear Creek which reaches Sacramento River; and from Oliver P. Demuth and Henry P. Farnsworth, in Roosevelt Placer Mine, near Placerville, El Dorado County, Cal., draining into Irish Creek which reaches south fork of American River, gives notice that a meeting will be held at Room 36, Flood Building, San Francisco, Cal., November 10, 1902, at 1:30 P. M.

Centrifugal Dredging Pump.

Herewith is illustrated a centrifugal dredging pump built for the new dredger now being constructed for the port of Portland, Oregon, for dredging the Willamette and Columbia rivers. The port of Portland, after years of experiments with small dredging pumps, concluded that in order to maintain a proper depth of water in the 100 miles of the rivers which lie between Portland and the Pacific ocean, that it was necessary to build a mammoth dredger. Under the directions of J. B. C. Lockwood, consulting engineer, Seattle, Wash., a dredger having a length of hull 225 feet, a width of 42 feet and a depth of 11 feet has been constructed. After submitting specifications for public bidding the contract to furnish the machinery for this dredger was let to three different firms—the Willamette Iron & Steel Works of Portland, Or., receiving the contract for the pumping engines; the Oakland Iron Works of Oakland, Cal., received the contract for the hoisting engines, the cutter engines, and the swinging and spud engines, and for the furnishing and assembling of all the other machinery upon the dredger; and Knight & Co. of Sutter Creek, Amador county, Cal., received the contract to build the large centrifugal pump.

This centrifugal pump is 10 feet 10 inches in diameter, 2 feet 8 inches wide on the outside, and has an inside dimension of 10 feet in diameter and 22½ inches in width. The runner is 8 feet diameter and is made with a cast steel center, weighing about 3500 pounds, to which the sides are riveted. These sides are made of ¾-inch steel plates, which are securely riveted to the steel casting of the vanes and runner frame. The door on the suction side has a 30-inch elbow with a pipe leading to the ladder of the dredger and connected to the ladder gudgeon with a universal joint. The suction pipe leads down to the revolving cutter,

which is operated by twin compound engines stationed at the upper end of the ladder and so arranged that the raising and lowering of the ladder by the hoisting engines does not affect the working of the cutter engines. This ladder is 74 feet long.

It will be noted from the halftone that the pump is circular in shape. The object of making it a perfect circle is stated by the manufacturers to be with the intention of doing away with the pulsation that takes place in a volute casing, caused by the runner passing that part of the casing which is nearest to it. They state that another advantage of building the pump circular is in replacing the ¾-inch steel liners inside of the pump casing.

An idea of the size of this pump may be gathered from the fact that it is operated by a triple expansion 2000 H. P. engine. This engine has an initial cylinder 21 inches in diameter, intermediate cylinder 34½ inches in diameter, and two low pressure cylinders each 40 inches in diameter, all of 24 inches stroke. The engines take the steam at 165 pounds boiler pressure. The dredger has capacity of its full swing of cutting a channel 300 feet in width and is stated by the makers to be the largest and most powerful machine of its type in existence.

Individual Mortar Stamp Mill.

The photo engraving herewith illustrates a novel form of 3-stamp mill now being built and placed on the market by the Joshua Hendy Machine Works of San Francisco, Cal., devised by John H. Hendy. Application for letters patent has been filed. This device is designed to cover a simple, compact arrangement of the several parts of the general type of a stamp mill, by which each of the stamps does its allotted work of crushing in its own separate individual mortar. The mortars are cast with quadruple or four-way discharging or screen outlets, these outlets being through the two sides and the rear and front ends of each mortar. The two end mortars are cast with sluiceways along their sides nearest the battery frame, and as well along their respective rear ends (the latter not being shown in cut); these sluiceways being provided for the purpose of conveying the pulp, as discharged from the mortars, onto and over the mortar aprons, and thence onto the line of silver-plated copper plate sluices placed below and leading from the front of the entire battery. The other or opposite sides of these two end mortars, and also the two sides of the middle mortar, are each cast with a protruding lip below the discharging outlets, to direct the flow of pulp into two cast iron sluiceways, of suitable capacities and proper grade, which are placed as shown in engraving, so as to discharge also onto the same line of sluices in front of the battery, all of the pulp thus discharged through the four outlets of each of the three individual mortars being conveyed to a common point of final distribution. The three mortars are set side by side, parallel with each other, each bolted to and through a heavy cast iron foundation plate to a mortar block of suitable dimensions. The intent in devising and designing this method of construction is to combine certain important factors in an attempt to attain the maximum of crushing capacity, by the stamping process, viz: To provide for the independent action of each stamp in its own separate individual mortar, and to secure the largest

Centrifugal Dredging Pump.

possible screen discharging area. In providing the first it is argued that the operation of each stamp being free from any counteracting influence or obstruction and undisturbed by the conflicting action of any other stamps, a perfect regularity of the flow of pulp to and fro and out of the mortar will be secured; and if, then, the largest possible screen area, consistent with the proper disintegration or reduction of the ores, can also be secured, for the proper discharge of the pulp from the mortar, in a proper condition, at the proper time, the combination of these two factors would necessarily produce large crushing results. If to this combination there be applied effective crushing work of a heavy stamp, given a quick drop, then it is further claimed by the designer that the largest possible crushing results will be obtained, and that while this independent action of a single stamp, in its own separate, individual mortar, having a properly proportioned screening area, will thus produce a maximum of crushing effect or work, that the degree of fineness of the resulting pulp must also be more uniform and a minimum amount of slimes be produced. Reference to the engraving will show the manner in which this combination is designed to be effected. The method of the arrangement of its distinctive features indicates that this form of stamp mill has some novel points of interest, which will attract the attention of mining and mill men.

E. L. McKee, a U. S. postoffice inspector, has been through Arizona in quest of evidence to enable the Government to successfully prosecute some manipulators of fraudulent mining schemes, under the U. S. statutes forbidding the use of the U. S. mails to defraud. If Mr. McKee is in earnest he might find excellent hunting ground east of the Alleghanies. There are apparent opportunities in that direction in New York and Boston. Casual perusal of sundry publications would indicate opportunity to punish those who use the mails to obtain money under false pretenses from unsuspecting investors.

ADVICES from all parts of the Northwest indicate unusually early rains, with corresponding snowfall in higher altitudes, presaging plentiful water for mining operations in the season of 1902-3.

SELDOM has the inventive genius of the American miner had more manifest success than in the adoption and adaptation of wire rope transportation, successfully solving the problem of cheap and reliable transportation where any other form of carriage of material was almost precluded. In San Miguel county, Colo., there are 30 miles of this airy telephage, stretched in some instances at a height of 13,000 feet. In Utah, Wyoming, Colorado, California and other sections they are of the greatest utility. One has recently been completed for the North American Co., owning the Ferris-Haggerty property, Grand Encampment, Wyo., which is said to be the longest in the world—16 miles between terminals. This is also described as being the only one ever built that connects two points neither of which is on a railroad, and as having in use double-tension stations, the latter made necessary because of unusual strain, at one point on the line the distance between towers being 2200 feet.

On page 231 of last week's issue appeared an extended notice of an extract from a bulletin of the U. S. Geological Survey on distribution of platinum and its associated metals, by J. F. Kemp. The conclusions of the monograph were that "experience thus far gained leads to the conclusion that platinum is very sparsely distributed in its mother rock and that the chances of finding it in quantities sufficient to mine are small. There is, nevertheless, a chance. If found, the recovery of the platinum by any means other than stamping and washing remains to be solved, and as the metal may be in a very finely disseminated state, this problem is a serious feature of the situation. Large and permanent placers are to be looked for only in very old land areas which have been subjected to protracted degradation and concentration. In the assay of antimonial, arsenical and other copper ores, but especially of tetrahedrite (gray copper or fahlerz), it is worth while to look for small percentages of platinum. Deposits of chromite deserve similar testing."

ADMIRAL MELVILLE has made a report on the use of fuel oil on board U. S. Government vessels, in which he sums up the following: That oil can be burned in a uniform manner. The evaporative efficiency of nearly every kind of oil per pound of combustion is probably the same. While the crude oil may be rich in hydrocarbons, it also contains sulphur, so that after refining the distilled oil has probably the same calorific value as the crude product. A marine steam generator can be forced to even as high a degree with oil as coal. The air requisite for combustion should be heated, if possible, before

entering the furnace. Such action undoubtedly assists the gasification of the oil product. The oil should be heated so that it could be atomized more readily. When using steam higher pressures are more advantageous than lower pressures for atomizing the oil. Under heavy forced draft conditions, and particularly when steam is used, the board has not yet found it possible to prevent smoke from issuing from the stack, although all connected with the tests made special efforts to secure complete combustion. Particularly for naval purposes is it desirable that the smoke nuisance be eradicated in order that the presence of warships may not be detected from this cause. The consumption of liquid fuel cannot probably be forced to as great an extent with steam as the atomizing agent as when compressed air is used for this purpose. This is probably due to the fact that the air used for compressing purposes, after entering the furnace, supplies oxygen for the combustion, while in the case of steam the rarefied vapor simply displaces air that is needed to complete combustion.

Price of Copper.

The probable price of copper in 1903 is of present interest, and many not gifted with the faculty of correct prophecy realize that the law of supply and demand will regulate the matter. To this paper it seems the copper consumption must increase, and that the present price will not be materially lowered. That this view is entertained by men long in the business of mining and selling copper is manifest by the extension of their operations and the betterment of their plants. This continuously increasing demand is the strongest factor in sustaining the price, for it is clear that any rigging of the market or juggling with stocks can have no effect other than temporary unsettling of values, and that the permanent solid thing about the business is the steady demand for copper in the industrial world.

For some time the price of copper was not fixed by the consumption, nor the cost of production, but artificially regulated around 17 cents per pound by stock manipulators independent of commercial conditions. Of course the inevitable occurred and anything in the way of a promising copper prospect was exploited with the result of a tremendous increase in the product, too great for even the extensive demand to meet. With the inevitable surplus came the inevitable reaction and break in prices. Then came also the prophecy that improved metallurgical processes would enable nearly every copper producer to turn it out at an average cost of half the then selling price. Even the clever effort to corner the market failed before such probability of cheapness, and the usual device of restricting production failed to sustain a falling market.

Effort was made about this time to approximately know the cost of production, but no general rule could be formulated, as so many factors entered into the question as to make it almost entirely a local one. It was, and is, evident, however, that, so far as the west half of the continent is concerned, the mine that produces copper "as a by-product" can market it the cheapest, for, however much may be manifest the triumph of metallurgy in such cases as the Atlantic mine of Michigan, where ore carrying but 1½% copper is mined and milled at a profit, yet the strength of the game lies with the property where the gold and silver yield pays all costs of production leaving the copper as net profit.

This was one of the delusions practiced in the days of 17-cent copper in the announcement of dividends from copper, in ignorance or defiance of the fact that in the case of great copper properties that produced gold and silver as well, in some cases, nearly half the dividends credited to copper should fairly have been credited to the gold and silver also derived therefrom.

So that the situation was that the stimulus of high prices increased production beyond possibility of present consumption and the baseless fabric fell. The swing of the pendulum the other way sent the price from 17 toward the 10 cent mark, and so it is only within the last year that the invariable and inevitable law of the business world has made all causes contribute to an even balance where steadiness of price becomes more likely.

While it does not seem probable that present prices

will go lower, it is manifest that those copper miners who are fortunate enough to have other metals in their matte will be least affected by any possible fluctuation.

Cripple Creek Drainage.

The manifest need of drainage of Cripple Creek, Colo., district has been discussed herein at length, and the economic effect of pumping or tunnel drainage gone over in detail.

The Cripple Creek mine owners have recognized that joint action is necessary, and a recent meeting of the mining interests went into consideration of the matter with the result that a deep drainage bore was endorsed and the committee report recommending such a tunnel was adopted.

The committee briefly discussed the pumping proposition. It was figured that 44,000,000 gallons would have to be pumped out to lower the standing level of the water in the district 1 foot; from this it was approximated that in addition to the cost of equipment and installation it would cost from \$1000 to \$1500 per foot to lower the water level by pumping, and the statement was made that one-half the total sum so required would produce the same result by tunnel drainage. The pumping plan would manifestly give quicker results, but the cost and ultimate requisites caused the committee to favor the general proposition of unwatering by tunnel.

It was estimated from reliable data that the amount of water drained for each foot in lowering the water level in the following years was:

	Gallons per foot.
1899.....	107,000,000
1900.....	77,000,000
1901.....	36,000,000
1902.....	44,000,000

Along this line the committee discussed several proposed tunnels, and with reference to the depth at which water stands in the different mines it was the sense of the committee in its report that a tunnel with a maximum length of 10,000 feet cutting at a depth of 500 feet below the present mean level of standing water would, on the whole, be most desirable, and so recommended. They figured that such a tunnel could be driven in two or three years, and that it would cost from \$25 to \$30 per running foot.

The report of the committee recommending the tunnel plan was adopted and a committee on ways and means appointed.

There was a unanimity of acquiescence in the committee's report and an expression of belief in the feasibility of relief in the plan proposed.

Having decided upon the plan to which the mine operators of the district are now committed, the question of cost, and how that cost shall be provided, comes up. While, of course, the cost—say \$400,000—cuts no figure in comparison to the extent and value of the interests involved, yet some clear-cut, definite, mutually hindering plan should be agreed to at the start. A joint company with power to levy assessments pro rata to the proportional benefit has been suggested, but in an undertaking of that kind involving so much time, it is questionable if such a plan would be a good one. Some would tire of paying assessments; changes of ownership would occasion legal quibbles, and the history of such co-operative plans is not encouraging. It were probably better to organize a separate company composed of those whose manifest future interests were largely bound up in making the tunnel a success, and that—present financial requirements being provided for—there be paid royalties. In one sense that would comprise "assessments," but not in the generally understood way of mining company assessments.

The deep tunnel plan deserves commendation. Ultimately the district will have to solve the problem some way, and the plan adopted by the mine operators offers the fewest objectionable features. The history of all such schemes is, however, one of vexation and delay, and the Cripple Creek operators will have to exercise due share of the patience that is a necessary element in everything relating to mining. The question will be successfully solved, for anything that stands in the way of a \$20,000,000 yearly gold production in so limited an area will, of course, be set aside and conquered, but the problem will be more speedily and satisfactorily solved by starting right. This the Cripple Creek miners seem disposed to do.

Concentrates.

A CUBIC FOOT of newly-fallen snow will weigh five pounds.

PROTOGENE is a variety of granite in which talc takes the place of mica.

ALLOWING 6 inches of topping, a mine car 9x4½x2 feet would hold 101.25 cubic feet coal.

THE horse-power of 1 inch water under 100-foot fall is .24147; of 40 inches, same fall, .96588.

A MILL SITE is not a mineral entry. The land so entered must be shown to be non-mineral.

ONE cubic foot atmospheric air, 60° F. temperature, barometer 30 inches, weighs .0766 pound.

TO FIX bolts in stonework a mixture of three parts sulphur to one part Portland cement is good.

SO FAR as known, the term "a harrel of copper" is used only in Michigan, and there means 900 pounds.

AN ore shoot is an ore body in place on the vein or lode. An ore chute is what the ore is sent through for handling.

TO SOLDER a piece of carbon and a piece of brass together, copper the carbon with a battery, then attach the brass with soft solder.

THE ordinary mercury loss in a 10-stamp mill should not exceed 15 pounds per month. A pound of quicksilver occupies 2.035 cubic inches space.

A LOCATOR of a mining claim can abandon any portion of his original location without forfeiting any rights he may have to the balance of the claim.

THE two largest stamp mills on the Pacific coast (excepting Alaska) are the Yellow Aster, Randshurg, Cal., 130 stamps; and the Golden Cross, Hedges, Cal., 140 stamps.

A RESERVOIR of 100 acres area would require an inflow of about ¼ cubic foot per second to maintain its height and counterbalance loss by evaporation; a 500-acre area, about ¾ cubic feet per second.

DYNAMITE (40%) is now selling at Butte, Mont., in carload lots at \$13 10 per 100 pounds; in 10,000-pound lots at \$13.60; in 5000-pound lots at \$13.85; in 2000-pound lots at \$14.10, and in 1000-pound lots at \$14 35.

A 10-STAMP BATTERY, dropping 1, 5, 9, 7, 3, 2, 6, 10, 8, 4, has given generally satisfactory result. Approximately, an ordinary concentrator day in and day out would require from 200 to 300 gallons water per hour.

TAKING the general average of service, quality and kind of ore, it may be said approximately that the wear and tear of shoes and dies is thirty-five to forty-five pounds, respectively, per 100 tons ore crushed.

IF eight persons make eight separate placer locations of twenty acres each, and seven of the locators convey their claims to the other, it requires annual assessment work of the value of \$800 to maintain possessory right to the claims.

BIARIUM SULPHATE is usually found in association with lead ores, though sometimes with manganese or copper. It is of widespread existence, occurring in beds and also in veins, but is mostly mined in Missouri and southeastern States. The annual production is about 50,000 tons.

WORK done on a ditch or canal may be applied to the representing of a number of contiguous claims held in common, if done for the benefit of such claims—that is, if it tends to the prospecting or development thereof, and is sufficient in amount to equal the necessary expenditure upon all the claims.

KNOWING the volume and velocity of the water, the necessary diameter of the required pipe can be determined as follows: Multiply the number of cubic feet of water by 144, divide the product by the velocity in feet per minute, divide quotient by .7854; the square root of the last quotient is the required diameter in inches.

IN putting on belting, it should be stretched as tightly as possible, and with wide belts this can be done best by the use of clamps secured firmly to each end of the belt, and drawn together by clamp rods running parallel with and outside the edges of the belt. There is no danger of breaking, as a belt 6 inches wide and three-ply thick will stand a direct strain of 5000 pounds, and others in proportion.

SPONGE LEAD is produced from litharge by placing it in contact with a sheet lead cathode in an electrolytic cell having a lead anode and dilute sulphuric acid as the electrolyte. The deposited hydrogen reduces the litharge, leaving a lead sponge of fine quality. This process is employed by the National Battery Co. at Buffalo, N. Y. The Electric Lead Reduction Co. of Niagara Falls, N. Y., is also producing sponge lead by subjecting galena to electrolysis.

WHERE the same person or company owns several contiguous mining claims capable of being advantageously worked together, and adopts one general system of developing them all, the value of the work done and improvements made pursuant to such system, whether done on only one of the claims or outside of them all, is available toward meeting the requirement of Section 2325 of the Revised Statutes relative to the expenditure of \$500 for each of such claims.

"CONCENTRATES" craves continued patience from some inquirers. 'Tis easier to ask questions than to

answer them, and some of the questions are twisters. Effort is made to give correct answer as soon as possible, but after all there is no obligation to wait, and if immediate speed as well as accuracy be demanded, doubtless the payment of a good round fee to some expert engineer, metallurgist, mechanic or lawyer might quicker elicit the desired information.

TO REMOVE PAINT from old oak, dissolve as much potash in hot water as the water will take, and, while still hot, stir in sawdust so as to make a fairly stiff paste. Spread this an inch thick over the wood, and after a few hours the paint or varnish will wash off with cold water. If necessary, the process can be repeated on any part. This will not hurt the oak, though it may for the time being give a whitish tinge; but rubbing over with hotted oil will restore the full natural color.

OFTEN belts are made uneven, and with the best of care, soon get out of shape. One sometimes finds a belt that ordinarily runs easy on the pulleys, suddenly inclined to run to either one side or the other of the driven pulley. Either the belt has been too slack or the load has been increased from want of lubrication or other cause. In either case it will run off if you insist on applying the power. The remedy would be to either take up the belt, thoroughly oil the journals or take off the extra load—maybe a combination of all.

A BOILER when about to be laid up for a season should be thoroughly cleaned on the inside, filled with water with steam on, so as to be full of hot water that has been boiled, up to the safety valve. The flues and fire surface of the boiler should then be cleaned; ashes and soot removed from every part where such lodge. Then close fire doors, ash pit, and put a cap on the smokestack. With this treatment laid-up boilers do not rust inside or outside. It is the moist air drawn through a laid-up boiler that does damage by rust.

THE gist of the decision in the Superior Court of Sutter county, Cal., wherein the validity of the Caminetti Act is assailed, is where the court held that the Cal. Debris Commission has lawful power to exercise any functions of a judicial character while acting in the interests of hydraulic mining, that the power relates only to those persons who voluntarily place themselves within its jurisdiction, and that its actions or orders or judgments can not bind any one else; that it has no jurisdiction over parties claiming to be injured directly or indirectly by hydraulic mining operations.

A ROCK is defined as an aggregate of minerals. A mineral is a naturally occurring chemical compound and therefore has a definite composition and belongs to a particular crystalline system. A rock being a mechanical mixture of different minerals has no definite chemical constitution. For example, granite is an aggregation of the minerals quartz, feldspar and mica. Granite, therefore, has no definite chemical composition. Petrology, or lithology, as the science of rocks is variously known, is in an indefinite condition. New terms are being coined and old terms are being assigned new meanings, so that one who does not keep up to date is frequently confused when reading current treatises on rocks.

THE cost of a telephone plant can be estimated, approximately, on a basis of the number of telephones installed. An exchange of 500 telephones installed within a radius of 1½ miles and no conduit or cable work, but up-to-date construction, will cost, approximately, \$65 a telephone, or \$32,500. As the number of telephones increases the radius or distance from the exchange will also increase, and therefore the cost. In estimating on 1000 telephones installed one must take into consideration some aerial cable and more substantial construction and more costly equipment. Therefore there would be a material increase in the cost per telephone, without conduit work. A safe approximation would be \$85 per telephone, or \$85,000 for the plant, within a given radius.

CARBORUNDUM is carbide of silicon. It is an abradant, harder than emery, and is used for the same purpose as the latter. It is made into wheels, into tools of various forms, and into hones. The process of manufacture consists in heating electrically, to a very high temperature, a mixture consisting of 60% pure sand and 40% powdered coke. To this mixture is added a small amount of common salt, and sufficient sawdust to render the mass porous, so that gases, which are liberated in large quantities, may escape. This mixture is packed around a core of coarse granulated coke, the grains having diameters of from ¼ to ½ inch. An alternating current is sent through the core and produces heat, which does not easily escape through the surrounding mixture. The result is a great temperature elevation and the formation of the carbide, some of it being in the form of beautiful violet colored crystals.

THE cost of sinking an incline shaft, following the dip of the vein for from 100 to 300 feet in depth does not usually exceed the cost of a vertical shaft 5%, and rarely 10%, time, labor, material and all things considered, while every foot sunk upon the incline shaft, providing the vein is not irregular in its dip, proves the magnitude of the ore therein and affords better opportunities for drifting upon the ore bodies disclosed. There are instances where incline shafts have been sunk at considerably less cost, and have been and are being used as the main working shafts, at a cost not exceeding the operation of vertical shafts of depths not greater than 500 feet. Having attained a depth of 500 feet, approximately, and having drifted at various levels into or along the ore shoot upon which the incline shaft in all probability has

been sunk—having demonstrated by such development work the average length and width of an ore shoot or shoots to such depth, and the trend of the same—if the magnitude of the ore bodies and the value of the same, as determined by those competent to render such determinations, are sufficient to justify the cost—then might a more economic and systematic plan for future operations of the mine be formulated and put into execution.

THE Comstock, Nev., lode was first discovered as a gold mine, although the subsequent discovery of sulphurets of silver among the gold eventually made it the first silver mine in the United States. But it was not until the fifth year that silver predominated over the gold, the yield for that year being: Gold, \$4,940,000; silver, \$7,460,000; total, \$12,400,000. Its greatest product in any one year was during the honanza days of 1877, which recorded a yield of: Gold, \$14,520,614.68; silver, \$21,780,922.02; total, \$36,301,536.70. This is taken from the official Government report, Treasury Department, Washington. Afterward gold again predominated, the yield for 1885 being: Gold, \$1,729,531.25; silver, \$1,415,071.04; total, \$3,144,602.29. Gold has continued to predominate each year since. The total yield of the Comstock to date is officially given at about \$370,000,000, over \$200,000,000 being silver.

ONE CUBIC FOOT of oil containing 6.2 gallons, weighing 7½ pounds per gallon, equals 48.05 pounds of oil. The theoretical amount of air required to burn 1 pound of oil is 15 pounds. One pound of air contains 13.2 cubic feet. Multiplied by 15, the lowest number of pounds of air that will furnish the necessary oxygen to burn 1 pound of oil equals 198 cubic feet of air required to burn 1 pound of oil. One hundred and ninety-eight multiplied by 48, the number of pounds of oil per cubic foot, equals 9504 cubic feet of air to burn 1 cubic foot of oil. At this ratio oil must be expanded to 9500 times its normal size before it is of equal density as that of the lowest amount of air actually required. And as the amount of air admitted is generally greater than what is actually used, this estimate is conservative. By feeding oil in a spray with steam, the weight of the two is greater than that of the two alone, as by the action of heat steam is changed to oxygen, which can be utilized in the process of combustion.

A DECAPOD ENGINE has ten driving wheels. The biggest "decapod" is owned by the Santa Fe Railway Co. It is an oil burner, and is guaranteed to haul 2100 tons up a 50-foot grade. The engine, minus the tender, weighs 137½ tons. On the drivers there is a weight of 230,000 pounds, or 115 tons. To the top of the stack the height is 15 feet. The boiler at the smallest ring measures 78 inches in diameter; at the largest ring, 88 inches. The firebox is 9 feet long and 79 inches wide. In the boiler there are 413 flues, each having a diameter of 2½ inches and a length of 18 feet 6 inches. The wheel base is 20 feet; total wheel base, 28 feet 11 inches; total wheel base of engine and tender, 62 feet. The cylinders have a stroke of 34 inches. The diameter of each of the driving wheels is 57 inches. The machine stands 15 feet 6 inches above the rail, the dome and stack being about the same height. The tender has a capacity of 7000 gallons of water and 2250 gallons of oil. The total weight of the engine is 262,000 pounds and of engine and tender 363,000 pounds, steamed up and ready for service.

THE question, "Does gold grow?" depends entirely upon the sense in which the word "grow" is used. The word is properly applied only to things possessing organic life, either animal or vegetable. It is improperly used in designating increase of size, as when we say a stream is growing larger, or a sandbar is growing. We mean by this that they are increasing in size, but not that the increase is due to life, as is a tree or calf, when they grow. Gold nuggets undoubtedly increase in size, and gold is being constantly deposited in rocks and veins and placers, but the increase in size and the deposition are due to mechanical and chemical action, and not to life growth. Many waters which percolate through the earth's crust contain gold in solution, and this gold, when it meets proper precipitants, is deposited. That precipitant may be an earth current of electricity, some vegetable growth or chemical in the rocks. It has been claimed that the nuggets found in placers are accumulations from the waters that percolate through the gravels, and are not from decomposed quartz as generally supposed. Those who so hold cite the fact that in the center of nuggets can be often found a small grain of iron sand. This was the nucleus around which the earth current of electricity deposited gold from the waters, just as it is deposited in electro-plating. During long ages this influence was at work, little by little increasing the size of the nugget, until they become much larger and purer than any ever found in veins or ore. Gold has frequently been deposited in mine timbers which have long been immersed in mine water. In the California State Mining Bureau museum there is a specimen of a piece of jointed cap and post taken from the Comstock, where it had been under water for years, in which gold has been deposited in the joints and pores of the wood. It is a well known fact that organic matter is a good precipitant of gold. Charcoal is used as the precipitant of the gold from the chlorine or cyanide solution. It forms an item in the constitution of sea weeds, which have taken the gold from ocean waters. But all this deposition of gold is not life growth. It is only a dead, inanimate accumulation, no more to be called growth than the accumulation of sand in a heap by wind or waves is to be called a growth of sand.

Determining the Size of Hoisting Plants.*

By EDWARD B. DURHAM, E.M., Trenton, N. J.

It is often necessary to calculate the size of a hoisting plant required to raise a given quantity of material, either as a preliminary to the detail design of the machinery, or to decide whether machinery on hand or offered by a manufacturer is adapted to the work to be done.

The first element of the problem to be determined is the load to be raised. In a mine that is already developed this is limited by the size of the car that can be hoisted out of the mine and that will pass through the underground gangways. If these place no limits on the design, the size of the load will depend on the output desired per day and on the number of hoists that can be made per day. The latter are fixed by the time required per hoist and the number of hours available for hoisting, after deducting from the working day the time required for raising and lowering men, sending down supplies, and for the many small delays in handling cars. It must also be decided whether the hoisting is to be done in one shift or in all of them.

As an example, assume an output of 400 tons per 10 hours; shaft, with two compartments, 1000 feet deep; hoisting in balance; time available for hoisting, 6 hours; engine can hoist load in 1.5 minute, and time to change cars 0.5 minute (the change at top and bottom of shaft being made at the same time). Then, 30 cars can be raised per hour, or 180 cars in 6 hours. This would require cars of 400 ÷ 180 = 2.22 tons capacity to handle the desired output.

With a single shaft, the time to raise one load is the time to change or load cars at the bottom, hoist loads, change cars, or dump at the top and lower the empty cars, while in a double shaft two cars could be handled while the above programme was being carried out in a single shaft, as the second load would be raised while the first empty was going back down, and changing of cars at the top and bottom would be going on simultaneously.

ROPES.—Having settled the size of the useful load to be hoisted, the size of the rope must be determined. This must be strong enough to hoist the total load, including its own weight, and to withstand the starting stresses due to picking up the load suddenly when the rope is slack. Experiments have shown that in starting with 6 inches of slack rope the stress in the rope is about double that due to picking up the load gently. Expressing these stresses in a formula, let

K = stress in rope in pounds, at the head sheave, at the instant of picking up the load.

W = weight of gross load in pounds.

R = weight of rope in pounds.

F = friction in pounds. = weight of all moving parts multiplied by f.

f = coefficient of friction.

Then $K = 2W + R + F$. (1)

This stress should not exceed one-seventh of the ultimate strength of the rope. The coefficient of friction f may be taken as .01 for vertical shafts and as .02 to .04 for inclined shafts with rope well supported on rollers.

As an example, required to find the size of rope necessary to hoist a total load of 5000 pounds from a vertical shaft 1500 feet deep. Assume, for a trial solution, that rope weighs 2 pounds per foot. From equation 1, $K = 5000 \text{ pounds} \times 2 + 1500 \times 2 \text{ pounds} + .01 \times 8000 \text{ pounds} = 13,080 \text{ pounds}$, and ultimate strength of rope should be $7 \times 13,080 = 91,560 \text{ pounds}$, which would require a 1½-inch diameter flexible cast steel rope, having an ultimate strength of 100,000 pounds and weighing 2.45 pounds per foot. This weight would increase R in above equation and make $7 \times K = 96,285$, which is still less than the ultimate strength of the rope chosen. If a lighter weight rope is desired, a plow steel rope could be used instead of the cast steel.

If the shaft is inclined, the stress in the rope due to the weight hoisted will vary with the sine of the angle of inclination, thus:

$K = (2W + R) \sin x + F$, (2)

in which x is the angle of inclination. Here the friction is also affected by the slope, and varies with the cosine of x, or $F = f(W + R) \cos x$; f may be taken as .02.

In the following discussion the loads will be considered as being hoisted from vertical shafts, as the principle remains the same for both classes, the only difference being that the stresses in the rope and on the engine and other parts of the machinery change with the changes in the slope.

DRUMS.—The minimum diameter of the drums is determined by the size of the rope used, and the larger the drums the smaller will be the bending stresses and the more strength will be available for useful work.

William Hewitt has shown that, when the diameter of the sheave or drum is 44.5 times the diameter of a

19-wire cast steel rope, the bending stresses are two-thirds and the remaining useful strength is one-third of the "maximum safe load" that the rope will carry. The "maximum safe load" is taken as one-third the ultimate strength, which is about the elastic limit of the wire; or the available strength is only one-ninth of the ultimate. In order to cut down the bending stresses so as to leave one-fifth of the ultimate strength of the rope available for useful work, the sheaves must be about eighty times the diameter of the rope. Other grades of rope require different diameter of drums, as will be seen by studying Tables I and II:

Table II is based on the formula $k = \frac{Ea}{2.06 \frac{R}{d} + C}$

in which k represents the bending stress in pounds, E the modulus of elasticity = 28,500,000, a the aggregate area of the wires in square inches, R the radius of the bend in inches, d the diameter of the individual wires in inches, and C a constant depending on the number of wires in the strand. The values of d and C are, for 19-wire hoisting rope: $d = \frac{1}{16}$ diameter of rope and $C = 45.9$ *

As an example, required the working load of a 1-

inch cast steel rope running over a 6-inch sheave. From Table II the bending stress is found to be 9937 pounds, and from Table I the "maximum safe stress" is found to be 22,667 pounds, and the difference is 12,730 pounds as the working load.

The size of the rope fixes the minimum diameter of the drum, but the questions of speed and length of drum also influence the final choice of the diameter.

The maximum length of a drum, aside from the question of room, is controlled by the allowable fleet angle—that is, the acute angle included between two lines drawn from the ends of the drum to the head sheave. This angle should not exceed 6°, in order that the rope may lead well onto the head sheave, and so that one rope will not grind or mount the next one in winding onto the drum. It is usual to place the drum far enough back from the head sheave to keep the fleet angle within the limit; but where it cannot be done it is necessary to guide the rope onto the head sheave and onto the drum by rollers or sheaves running on vertical spindles. The bisectrix of the fleet angle should strike the middle of the drum.

TYPES OF HOISTING ENGINES.—Single-cylinder engines are used in mining to replace man or animal power for light work. They are always geared and provided with a flywheel on the crankshaft. They must be started to a fair speed, in order that the flywheel may develop sufficient momentum to carry the crank over the center before the friction is thrown in to pick up the load. The cylinder should have 75%

* Tables I and II were calculated by William Hewitt and are published here by his permission. The originals, with other data on wire ropes, appeared in a pamphlet entitled "Wire Rope and Its Application to Power Transmission," 1901, issued by the Trenton Iron Co., Trenton, N. J., from whom copies can be obtained.

more power than is necessary to simply raise the load, in order that speed may be maintained.

Double-cylinder engines are used for all the regular work of mining. They may be divided into the following classes:

First—Geared: Single cylindrical drum; double cylindrical drum; double conical drum.

Second—Direct Acting: Single cylindrical drum; double cylindrical drum; double conical drum; Koepe system; reels for flat rope.

Each of these has a field of its own to which it is best adapted. Thus the geared engine is used mostly for shallow depths and small outputs per day, while the direct acting engine is used where the output is large. There are many cases near the dividing line in which either type of engine will give equally good results, and it is largely a matter of personal choice as to which is used.

Geared engines are made with small cylinders and the engine proper runs at a speed of 100 to 200 revolutions per minute. The gearing usually gives a reduction of one-third to one-fifth, so that the drum revolves at a moderate speed. The small cylinders make the first cost lower than that of a direct acting engine, but the gearing for large hoists is a serious objection. The main gear has about the same diameter as the drum, so as to keep the pressure on the teeth as low as possible, and hence it has a circumferential speed equal to the speed of hoisting. Gearing, under favorable conditions, should not run at a speed over 1200 feet per minute, and with the large cast gears and the rough work to which hoist-

readily be run at an average speed of 1500 feet per minute, and the largest engines can run in deep shafts as much as 2500 feet per minute.

Single-drum engines are limited to small outputs per day, or to places where the first cost of the plant is so important as to outweigh the loss in increased operating expenses. This type of engine has many applications, as for sinking winzes and for other inside work; also for shaft sinking and for working coal mines on a small scale, where the cost of fuel is no item, as waste material is burned. They are largely used in the Joplin, Mo., district, where the hoisting is from vertical shafts 100 feet deep, the output often only 25 to 50 tons per day, and the ore raised in huckets without guides, thus keeping the dead weight small, as compared with the weight of ore raised. They are not adapted for regular mining work on a large scale, as the work expended in raising the cage, car and rope each trip would exceed the work of raising the ore.

Double-drum engines overcome the dead work of hoisting the ore carriers by balancing the weight of the cage and car in one compartment against those in the other. They are thus more economical to operate than a single-drum engine, and the cost of installing will probably not be over 50% greater than for a single-drum engine. As the cost of sinking a shaft large enough for two hoisting compartments and a manway is not much more than to sink one having only one hoisting compartment and a manway, the head buildings must be nearly the same in either case, and the double drum engine will have smaller

will be admitted for the full stroke and at its maximum throttle pressure.

Hoisting engines belong to the slow speed type of engines. Their valves are simple slide valves in all but the largest sizes, and then they are usually of the Corliss class. They seldom have governing devices, their speed being determined by the hoisting engineer by means of the throttle, the link motion and the brake.

With these classes of engines the piston speed may be taken at 200 to 400 feet per minute for engines of 12 to 24-inch stroke, and from 400 to 600 feet per minute for those with 24 to 72-inch stroke. Very high-grade engines, with other valve gearing, may run at higher piston speeds.

At the instant of starting, the power in one cylinder acting on the crank, in the top or bottom position, must have a moment equal to or greater than the moment of the unbalanced load pulling from the circumference of the drum. After starting, the other cylinder comes in to accelerate the speed and the two together are able to hoist the load with steam partially cut off and still maintain the full speed. In all the following equations let

W = weight of unbalanced load in pounds.

C = weight of cage and car in pounds.

O = weight of ore in pounds.

D = diameter of drum in feet.

P = M E P = mean effective steam pressure in cylinder in pounds per square inch.

A = area of cylinder in square inches.

FIG. 1

SINGLE CYLINDRICAL DRUM ENGINE

FIG. 2

DOUBLE CYLINDRICAL DRUM ENGINE

FIG. 4

FLAT ROPE REEL

FIG. 3

DOUBLE CONICAL DRUM ENGINE

cylinders, which will partly offset the cost of the second drum.

With cylindrical drums, the ropes in the two compartments are of constantly varying lengths from the cages to the head sheaves, and are in balance only when the cages are passing at the center. With double conical drums, the work on the engine is kept constant by giving the cage at the bottom the short leverage of the small end of the drum, and the cage at the top the longer leverage of the large end of the drum.

The Koepe system, as applied to a double-compartment shaft, has a tail rope passing from the bottom of one cage down and around an idle sheave at the bottom of the shaft and up to the other cage. Thus the weight of the rope in the two compartments is exactly equal, and the whole hoisting mechanism is in balance at all points of the trip.

The flat rope system of hoisting attempts to equalize the work on the engine by coiling a rope of rectangular cross sections on a reel, like a surveyor's linen tape, so that the diameter of the reel increases and the leverage of the load increases as the weight of the constantly shortening rope decreases. Thus the work on the engine is kept constant, when the rate of increase of leverage and decrease of weight are in inverse proportion to each other. The flat ropes, however, are heavier than round ropes of the same strength, are shorter lived, and cost more at first and for subsequent care. The flat rope system is very largely used in Montana, and in some other districts which have followed the Montana practice.

The peculiarities of the different types of engines are brought out more fully by the calculation of the size of their cylinders when equipped with the different arrangements of drums.

CALCULATION OF THE CYLINDERS.—The maximum work on the engine is in picking up the load and in overcoming its inertia. At this time one crank may be on a dead center, so that all the work must be done by the other. At this part of the hoist steam

L = Length of stroke in feet.

S = speed of hoisting in feet per minute.

N = number of revolutions of engine per minute.

F = friction in pounds.

f = coefficient of friction.

r = ratio of diameter of piston to length of stroke, both being in feet or both in inches, = $\frac{\text{stroke}}{\text{diameter}}$.

d = diameter of piston in inches.

e = efficiency of engine.

g = ratio of gearing = $\frac{\text{diameter of gear}}{\text{diameter of pinion}}$.

Then, for a single-drum, direct-acting engine (Fig.

1) the moment of the load = $(W + F) \frac{D}{2}$ and the moment of the engine = $(P \times A \times e) \frac{L}{2}$, placing these equal to each other,

$$\frac{(W + F) D}{2} = \frac{P \times A \times L \times e}{2} \quad (4)$$

If the drum is geared the engine will make g revolutions to one of the drum, or the leverage of the engine is increased to g times what it would be if direct connected, and the equation becomes

$$\frac{(W \times F) D}{2} = \frac{P \times A \times L \times e \times g}{2} \quad (5)$$

This is the general equation for all hoisting engines. If they are direct connected, the ratio of the gearing g = 1.

When the weight of the load, size of the drum, and steam pressure are given to determine the size of the cylinders, there are two unknown quantities in the equation, viz., A and L. Here L can be assumed and the equation solved for A, from which the diameter can be obtained. The usual practice is to so proportion the cylinder that the length of travel is one and one-quarter to two and one-half times the diameter of the piston. If the value of L chosen for trial gives a ratio of stroke to diameter outside of these limits, another value must be taken for L and another solution made. If the ratio is decided upon first, then the area can be expressed in terms of the

ing engines are subjected the speed should probably not exceed 900 feet per minute. If the average speed of hoisting is kept at about two-thirds of this maximum the average speed will not exceed 600 feet per minute. This speed will allow the use of moderate-sized drums and keep the piston speeds within the limits of good practice.

That gearing is liable to cause trouble and make considerable noise when run at a high speed has been forcibly impressed on the mind of the writer by his experience in charge of a geared hoister, made by a reliable manufacturer, having cylinders each 18 inches diameter by 24-inch stroke, and two drums, each 7 feet 6 inches diameter by 5-foot face, on which three main gears, between 7 and 8 feet diameter, 3-inch pitch and 9-inch face, were broken inside of nine months. The gears cost about \$300 each, besides the labor of replacing and the loss of 24 hours to change the old for a new one. The engine was hoisting from a shaft 1000 feet deep in about 1½ minute. The load of ore was 2½ tons.

Direct acting engines should not be used for hoisting speeds of less than 500 feet per minute, as the piston speed will be too slow for economy. They can

stroke, and there is only one unknown in the equation. Thus $rd = 12L$ or $d = \frac{12L}{r}$ ($12L$ being the length of the stroke in inches), and

$$A = \pi \frac{d^2}{4} = \pi \frac{144L^2}{4r^2};$$

which, substituted in equation 5, gives

$$\frac{(W + F)D}{2} = P \times \pi \frac{144L^2}{4r^2} \times \frac{L}{2} \times e \times g. \quad (6)$$

Having obtained the size of the cylinders, and knowing the speed of hoisting and size of drum, the speed of the engine can be obtained and the speed of the piston can be investigated. The speed of hoisting in feet per minute divided by the circumference in feet will give the number of revolutions of the drum per minute. If the drum is geared the engine will make g times as many revolutions per minute as the drum, and

$$N = \frac{S}{\pi D} g. \quad (7)$$

The piston speed in feet per minute $= 2L \times N$, or

$$\text{Piston speed} = \frac{2LS}{\pi D} g. \quad (8)$$

Where the engine is direct acting $g = 1$ in both equations 7 and 8.

The horse power available for hoisting when the engine is running at full speed will be expressed by the formula:

$$\text{H. P. of engine} = \frac{P \times L \times A \times 2N}{33000} \times e, \quad (9)$$

and the horse power required to raise the load will be:

$$\text{H. P. of load} = \frac{(W + F)S}{33000}. \quad (10)$$

In the examples here given the weight of the car is taken as two-fifths and the weight of the cage as three-fifths of the weight of the ore hoisted. These together make the dead load C equal to the weight of the ore O . These are sufficiently close to the usual practice for an illustration of the method of using the formulas.

As an example, take a double-cylinder engine geared to a single drum under the following known conditions, to find the size of cylinders required: Vertical shaft is 400 feet deep, cage to be hoisted in 1 minute; the weights are, cage 900 pounds, car 600 pounds, ore 1500 pounds; steam pressure, P is 60 pounds, $e = 0.7$, $g = \frac{1}{4}$, $f = .01$ (assumed), $D = 4$ feet, and L may be taken as $\frac{1}{2}$ foot for a trial solution; then

$W = C + O + R = (600 + 900) + 1500 + (400 \times 1) = 3400$ pounds. $F = Wf = 34$ pounds. Substituting equation 5,

$$(W + F) \frac{D}{2} = P \times A \times \frac{L}{2} \times e \times g$$

$$(3400 + 34) \frac{4}{2} = 60 \times A \times \frac{1}{2} \times 0.7 \times \frac{1}{4}$$

$$A = 54.5.$$

$$d = 2\sqrt{\frac{A}{\pi}} = 8.33; \text{ say } 8\frac{1}{2} \text{ inches.}$$

The stroke L was taken as 18 inches for a trial solution and it gives a well-proportioned cylinder, viz., $8\frac{1}{2}$ inches diameter by 18-inch stroke.

The speed of the piston can be tested by equation 8.

$$\text{Piston speed} = \frac{2LS}{\pi D} g = \frac{2 \times 1\frac{1}{2} \times 400 \times 4}{3.1416 \times 4} = 382$$

feet per minute, which is within the limits of these engines.

From equations 9 and 10, combined, the mean effective pressure required in the cylinders to perform the work can be determined. Substituting the known values in these equations, and placing one equal to the other and solving,

$$\text{H. P.} = \frac{(W + F)S}{33000} = \frac{P \times L \times A \times 2N}{33000} \times e$$

$$\frac{3434 \times 400}{33000} = P \times \frac{1}{4} \times \frac{2 \times 56.75}{33000} \times 2 \times$$

$$\left(\frac{400 \times 4}{3.1416 \times 4} \right) \times 0.7 P = 45,$$

which, with 60 pounds at throttle, corresponds to a cut-off of about one-half. As both cylinders are in use, the area has been doubled in the above calculation.

With double-drum hoisters, where the descending cage and car counterbalance the ascending ones, the general equation 5 still applies, but the values of W and F are changed. Referring to Fig. 2, when a loaded car is to be started from the bottom of the shaft and an empty car is being lowered at the same time,

$$W = (R + C + O) - C = R + O, \text{ and}$$

$$F = (R + 2C + O) f,$$

which values must be used in the first member of equation 5.

As an example, take a hoister raising a load from a double-compartment shaft 2000 feet deep in 1 minute: $O = 5000$ pounds, $C = 5000$ pounds, $R =$

6000 pounds, $D = 8$ feet, $P = 60$ pounds, engine direct connected; hence $g = 1$, $f = 0.01$, $e = 0.7$. Taking $L = 4$ feet for a trial and substituting in equation 5 to find the size of cylinders,

$$(W + F) \frac{D}{2} = P \times A \times \frac{L}{2} \times e \times g$$

$$(11000 \times 210) \frac{8}{2} = 60 \times A \times \frac{4}{2} \times 0.7 \times 1$$

$$A = 534$$

$$d = 2\sqrt{\frac{A}{\pi}} = 26\frac{1}{2} \text{ inches.}$$

This gives a cylinder $26\frac{1}{2}$ inches diameter by 48-inch stroke. Determining the piston speed by equation,

$$\text{Piston speed} = \frac{2LS}{\pi D} g = \frac{2 \times 4 \times 2000 \times 1}{3.1416 \times 8} = 637 \text{ feet}$$

per minute. While the proportions of the cylinders follow the usual practice, the piston speed exceeds the limits previously set for this class of engines, viz., 400 to 600 feet per minute. This speed can be reduced by choosing a smaller valuation for L in equation 5, which will give a cylinder larger in diameter. Thus, if the length had been taken as 44 inches, or $L = 3\frac{1}{2}$ feet, d would have been $27\frac{1}{2}$ inches,

and the ratio $\frac{12L}{d} = 1.6 +$, and the piston speed $=$

584 feet per minute.

Or, instead of shortening the stroke, the number of revolutions can be cut down by increasing the diameter of the drum. Thus, if $D = 9$ feet, $L = 4$

feet, d will be $27\frac{1}{2}$ inches, and the ratio $\frac{12L}{d} = 1.73$ and the piston speed $= 566$ per minute.

Conical drums, as already noted, are intended to equalize the varying load on the engine, due to the change in length and weight of the rope as the cage ascends and descends. As these engines are used where every economy is desirable, they are usually direct-acting and fitted with double drums.

The minimum diameter of the drums is determined by the size of the rope.

Referring to Fig. 3, let D represent the small diameter of the drum in feet.

y = diameter of large end of drum in feet.

C = weight of cage and car in pounds.

O = weight of ore in pounds.

Rl = weight of the long length of rope when cage is at the bottom of the shaft.

Rs = weight of the short length of rope when cage is at the top of the shaft.

Then $(C + O + Rl) \frac{D}{2} - (C + Rs) \frac{y}{2} =$ moment of

the resistance when the load is at the bottom (Fig. 3, position A), and $(C + O + Rs) \frac{y}{2} - (C + Rl) \frac{D}{2} +$ moment of the resistance when the load is at the top (Fig. J, position B). The object of the conical drums being to keep this moment constant, these two values must be equal, and

$(C + O + Rl) - (C + Rs) y = (C + O + Rs) y - (C + Rl) D$ (11)

Solve for y . Then, taking either end of the case, say when the load is at the bottom, the moment of the resistance of the loads, with friction added, must equal the moment of the power of the engine, and, following the same form as equation 5, gives:

$$(C + O + Rl) (1 + f) \frac{D}{2} - (C + Rs) (1 - f) \frac{y}{2} = P \times A \times \frac{L}{2} \times e \times g. \quad (12)$$

Taking as an example the one used for the engine with double cylindrical drums, depth 2000 feet plus $33\frac{1}{2}$ feet to head sheave above landing, $S = 2000$ feet per minute, $O = 5000$ pounds, $C = 5000$ pounds, $Rl = 6100$ pounds, $Rs = 100$ pounds, $D = 7$ feet, $P = 60$ pounds, $g = 1$, $f = .01$, $e = 0.7$, L for trial $= 4$ feet to find diameter of cylinder. From equation 11

$$(C + O + Rl) D - (C + Rs) y = (C + O + Rs) y - (C + Rl) D$$

$$(16100 + 7) - (5100 y) = (10100 y) - (11100 \times 7) y = 12.52 \text{ feet} = \text{diameter of large end of drum.}$$

$$\text{Substituting in equation 12}$$

$$C + O + Rl = 5000 + 5000 + 6100 = 16100 \text{ pounds.}$$

$$1 + f = 1.01$$

$$C + Rs = 5000 + 100 = 5100 \text{ pounds.}$$

$$1 - f = 0.99$$

$$(16100 \times 1.01 \times \frac{7}{2}) - (5100 \times 0.99 \times \frac{12.52}{2}) =$$

$$60 \times A \times \frac{4}{2} \times 0.7 \times 1$$

$$56914 - 31607 = 84 A$$

$$A = 301$$

$$d = 2\sqrt{\frac{A}{\pi}} = 19\frac{1}{2} \text{ inches.}$$

From equation 8

$$\text{Piston speed} = \frac{2LS}{\pi D} = \frac{2 \times 4 \times 2000}{\pi (7 + 12.52)} = 522 \text{ feet}$$

per minute, D being here taken as the mean diameter.

There must be a division left between the ropes on a conical drum in order to furnish positive grooves for the rope, so that the large coils cannot slip down over the smaller ones. Hence the drum must be longer than those of the cylindrical design, even when the mean diameter of the conical drum is the same as the diameter of the cylindrical one.

In the Koepe system, as applied to a double-compartment shaft, there is a tail-rope of the same weight as the hoisting rope fastened to the bottom of one of the cages, passed around a sheave in a pit at the bottom of the shaft, and attached to the bottom of the other cage. Then, in whatever position the cages are, in the shaft, there is the same weight of rope hanging in each compartment. Thus the entire weight of the hoisting mechanism is in perfect balance at all times, and the engine only has to raise the weight of the ore and overcome the friction of the moving parts. The main rope may be wound on a pair of cylindrical drums, or it can be wrapped back and forth over a pair of multiple-grooved sheaves, as is done in rope drives for many purposes. It is essential that a positive grip is taken on the rope by the driving mechanism, or else its creeping on the driving sheaves will make the indicators show a false position for the cages and make accidents of overwinding a great source of danger.

The calculation of the size of the engines required can be made by equation 5. The engines would usually be direct-acting.

As an example, assume the same conditions as have been used before:

$S = 2000$ feet per minute. $O = 5000$ pounds. $C = 5000$ pounds. $R = 6000$ pounds. $P = 60$ pounds, $e = 0.7$, $f = 0.01$, $g = 1$, $D = 8$ feet, $L = 4$ feet, for trial.

$$(W + F) \frac{D}{2} = P \times A \times \frac{L}{2} \times e \times g. \quad (5)$$

$$W = O = 5000 \text{ pounds. } F = f(O + 2C + 2R) = 0.01 \times 27000 = 270.$$

$$(5000 + 270) \frac{8}{2} = 60 \times A \times \frac{4}{2} \times 0.7 \times 1$$

$$A = 251.$$

$$d = 2\sqrt{\frac{A}{\pi}} = 18 \text{ inches.}$$

This is rather a small diameter for a cylinder of this length, as its length is two and two-thirds times the diameter, which exceeds the ratio already recommended. If L were taken as 36 inches, the area would be 335 square inches, corresponding to $20\frac{1}{2}$ inches diameter, which gives a cylinder with better proportions.

The piston speed can be obtained from equation 8, and the mean effective pressure required, when hoisting at full speed, can be found from equations 9 and 10 combined.

It is interesting to compare the size of the three types of engines, hoisting the same load at the same speed. These tabulated are:

Type.	Dia. of Drum.	$(W + F) \frac{D}{2}$	Dia. of Cylinder.
Cylindrical Drums.....	9.76	59198	29
Conical Drums.....	9.76	24669	19 $\frac{1}{2}$
Koepe System.....	9.76	25727	19 $\frac{1}{2}$

The conditions in all of the above were the same as used in former examples, except that the diameters of drums are all taken as 9.76 feet, which is the mean diameter of the conical drums. The engines are direct-acting, the shaft has double compartments and the cages work in balance. $C = 5000$ pounds, $O = 5000$ pounds, $R = 6100$ pounds, $P = 60$ pounds, $L = 4$ feet, $f = .01$, $e = 0.7$, $g = 1$, $S = 2000$ feet. The piston speed is 522 feet per minute in each case.

The table shows that cylindrical drums are not as economical to operate as either the conical drums or the Koepe system. The conical drums are expensive to make, as the grooves have to be formed spirally and with an increasing radius, and each problem requires a specially designed drum, so there can be little use made of stock patterns. They are only used where the rope is heavy, and the economy of accurate counter-balancing is clearly indicated, and will offset the extra cost of manufacture.

The Koepe system is a simple method of counter-balancing, and the principle could often be applied to existing plants with cylindrical drums by adding a tail-rope and an idle sheave at the bottom of the shaft, provided there is sufficient sump room for the sheave and its slide. The objection to the Koepe system, where used without drums, is the liability of the ropes to creep on the sheaves, causing the indicators to give a false record and so increase the danger of overwinding.

Flat ropes of rectangular cross-section are wound on a reel like a tape. When the load starts from the bottom of the shaft the rope winds on the center of the reel, which is of small diameter, and then, as the load rises, the successive layers increase the diameter of the coil on the reel. Thus the leverage of the

load increases and the weight decreases. If the original diameter of the barrel of the reel and the thickness of the rope are properly chosen, the moment of the resistance will be constant.

The proportions of the reel can be found as follows:
Let D = diameter of the barrel in feet.

y = diameter of coil of rope, when cage is at the top, in feet.

C = weight of cage and car, O = weight of ore, and R = weight of rope, all in pounds, as before.

l = length of rope or depth of shaft in feet.

t = thickness of rope in inches.

n = number of layers of rope in coil.

Then, referring to Fig. 4,

$$\frac{y+D}{2}n \times n = l \text{ and } \frac{(y-D)12}{2t} = n.$$

Substituting the latter value of n in the first equation gives

$$\frac{y+D}{2}n \times \frac{(y-D)12}{2t} = l.$$

$$(y^2 - D^2) \frac{3n}{t} = l. \quad (13)$$

From equation 13, knowing t , the value of y can be obtained, or, having decided on y , the equation can be solved for t . The minimum diameter of the barrel D depends on the thickness of the rope, and can be calculated from Mr. Hewitt's equation, previously given:

$$k = \frac{Ea}{2.06 \frac{R}{d} + C}, \text{ in which } k = \text{head-}$$

ing stress in pounds, E = modulus of elasticity = 28,500,000, a = aggregate area of the wire in square inches, R = radius of the head in inches, d = diameter of individual wires, and C a constant depending on the number of wires in a strand. With flat rope, $d = \frac{1}{2}$ the thickness of the rope and $C = 27.54$.

The moment of the resistance at starting the load would be the moment of the weight, $C + O + R$, plus the friction, acting with the lever arm $\frac{D}{2}$, as by equation 5.

The ideal case would be one in which the work of hoisting was constant at every part of the hoist; but the thickness of the rope may be such that the leverage of the load increases faster or slower than the weight of the load decreases, thus making the work on the engine vary during the trip. In such a case the design must be tested with the cage at various points, to make sure that the engine has sufficient power to handle the loads at the desired speed at all points. For these equations 9 and 10 may be used.

Generally these hoists are arranged in pairs, so that one cage ascends while the other descends. Then the necessarily large diameter of the reel, to make the work more constant on the engine, can be found by equation 11, used for conical drums, and the size of the engine from equation 12, after which the thickness of the rope can be found by equation 13.

If the reels cannot be made of such diameter, with a reasonable thickness of rope, as to make the work of hoisting uniform throughout the trip, then the case must be considered by itself, and the design must be tested with the cage in positions sufficiently numerous to prove that the engine that will start the load is strong enough to handle it at all points.

An Ingenious Theory.

Most pure metals are in an unstable condition. They have been freed from combination with other chemical elements by the expenditure of energy and these elements are always waiting their chance to enter anew into the combination. Will all the earth's available metals be finally used up? The history of the use of metals is that of the progress of civilization, so that their total disappearance would be a calamity. In a recent "Introduction to the Study of Metals" by a French author this subject is taken up, and the author concludes that the oxidized metals are finally transformed again into ores and will ultimately collect under ground for future miners to dig up again. We quote from a review in *Echo des Mines*:

"A metal, when extracted from its ore, is always subjected to the action of a large number of alternative forces under whose influence its weight diminishes little by little, until it ends by disappearing. Its life may be short or it may be extremely long, but it returns at last to the earth whence it came. It is to be noted that in most cases it even reassumes the form in which it was first found as an ore. Iron or tin, which we extract generally from their oxides, are destroyed by oxidation; the principal sources of copper are oxides and sulphides, and this metal disappears chiefly by oxidation or sulphuration; silver, which we find in the form of simple or complex sulphides, is changed back into sulphide with great ease; and lead, whose principal alteration products are the sulphide and the carbonate, is found chiefly in the form of galena and ceruse. Gold and platinum, which are rarely found other than pure, and which are only slightly alterable under the most di-

verse influences, are used up and disappear by friction and mechanical action.

"Thus, the masses of metal prepared industrially are altered and disappear little by little, and their remains are scattered as dust that mingles with the other elements of the soil. Then they meet with saline substances and with water, which dissolve and mineralize them, causing them to enter into the cycle of operations that is going on in the interior of the globe. These waters circulate in the cavities of the earth's crust, and apparently they take part in the reconstruction of minerals, which, in the course of centuries, will form new metalliferous deposits to be exploited by the industries of a distant future."

The History of a Catalogue.

NUMBER IV.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. H. FITCH.

The Shakespearian phrase, "All this strange, eventful history," applies to our treatment of the subject in its strangeness, if not in its eventfulness. One of the most curious things about a catalogue is its size. This bears out my contention that the mainspring of the catalogue is personal advertisement. We may preach till the crack of doom about the convenience of standards and uniformity, but it is as difficult to get a catalogue publisher to use uniform size as it would be to get a free American to wear livery. Every man wants his catalogue to be something different and unusual, and an odd size appeals to the imagination as the cheapest kind of peculiarity that can be indulged. Few men keep well regulated catalogue piles, and these find life too short to permit of their huying many goods. A catalogue filed neatly on the shelf with other catalogues of the same size is entirely too unobtrusive. It does not get in our way and attract our attention enough. Odd sizes are a bother, but people who bother us get our business. A catalogue too irregular to keep and too good to throw away is a living issue until its fate is decided, but a catalogue filed is very likely relegated to oblivion.

Catalogues giving illustrated lists of supplies are to be excepted from the criticisms made against the ordinary run of argumentative catalogues. But these elaborate useful reference lists have a limited purpose. They are designed chiefly to serve the ends of the jobber and middleman, and not to help the user in his selections. To connect properly with the user they often require a great deal of explanation. And they are the greatest sinners against standard size, ranging from vest-pocket souvenirs to "unahridged dictionaries."

When some manufacturing concerns get an infusion of new thought, or turn over a new leaf, resolving that they will thenceforth do things in a way more satisfactory to their patrons and their profits, the first fruits of these good intentions are often expressed in a new size of catalogue—something that will mark a new era. These efforts are ephemeral, but the odd sizes remain.

The hardware manufacturers of Connecticut set a fashion of encyclopedia sizes. Their goods were small—door locks and knobs—but the way they were shown up was a feast for the engravers. An effort to reduce bulk was made by the Yale & Towne Co., who employed Henry H. Supplee, a gifted technical writer, who translated Reauleaux's great work, "Der Constructeur," and the Lubben system of mathematics. The result was one of the most elegant little volumes ever published on any subject, something for the bibliophile to cherish. Everything is closely detailed, dimensioned and coded, and a companion volume gives a key to the other, including prices. For its purpose, it is hard to see where it could be improved. It is standard size, 6"x9", but secures special attention by the merit of its make-up.

One objection to the standard 6"x9" is that it cramps illustration, and we must either illustrate poorly, or put in folders, or illustrations cut in twain by the backbone of the book.

About twelve years ago the Westinghouse people spread themselves in a new catalogue which was large enough to go by freight. It was wider than a door and had covers of heavy board glazed with mineral, so as to represent blacksmith work—a kind of iron gate.

It contained a treatise on sectional machinery, probably obsolete by this time. I question if anyone ever read that treatise out of that book, for the reader would have been like Moses—needing a man on either side to hold up his hands—as was done by Aaron and Hur. This book emphasized the existence of a great company. A lot of them were received by the concern I was with; but if the money spent in their making had been put into commissions it would have done more to help sales. For a few weeks the pile of them occupied a desk space in a crowded office. But we had samples enough of iron, wood and similitudes thereof already lying about the place, so the catalogues were removed to the cellar. We could not afford to send them out. At last I saw several of them stood up to form a bin for charcoal. Surely, that thing is best which is not highest nor costliest,

but which is most exactly fitted to its reasonable and modest purpose. Contrast with the monstrosity mentioned the elegance of Mr. Supplee's catalogue, in which, by the way, his name does not appear. The taste and finish of the latter was an expense, but it was all in the line of useful requirements, thought and care in every line.

I am opposed to irrelevant matter in catalogues. Dirt is described as matter out of place, and, to be in place, we should have our catalogues defined by their titles, to indicate what we can surely find in them. It is a mistake to suppose that mining men have time to hunt out the treasures of useful information hidden in some catalogues. Indexes are a subject worthy of expert care. A "horse index" is a name given to one, laughable from a technical standpoint. I had turned over to me a catalogue on which well-known engineers had spent time of preparation with several thousand dollars. Its arrangement could not have been worse if it had "happened in the night," as James Maxwell used to say of a disorderly design. Among its treasures was the most equine kind of a "horse index." For example, things were indexed under particles "A" and "the," and under "I" was a string of "Illustrations of this" and "Illustrations of that." It strikes me that a person who would make such an index as that would not know which end of a knife or fork was the handle.

To make a good index a man must have a logical mind and a close acquaintance with his subject. To set the ideas in order in running text does not require more wit than to make the captions and arrange them in a table of contents. There are problems in indexing as yet unsolved. Try to index a catalogue of hoisting engines. The number of functions and varieties is large, but language and common understanding have not been made to meet in a concise method of describing them. I had a discussion on this very point with an engineer of the Rand, and challenged him to index a list of various types of hoisting engines. He thought it would be easy, but, when put to test, promptly begged off.

No catalogue of hoisting engines that I know has a good index. Some have pictorial indexes giving a few pages of small cuts, so that the reader can see and refer to what is beyond the scope of our language to briefly and fitly describe. With all our expansion of dictionary and scientific terminology the catalogue requirements are not satisfied.

I had an amusing inquiry from an encyclopedia writer—a classical graduate, whose acquaintance with doctrinal theology was supposed to be adequate equipment for handling any every-day technical subject. He asked information about "the" process for getting gold; the way the inquiry was put showing that he thought it all a simple little thing. Every reader of the MINING AND SCIENTIFIC PRESS—to which I referred the gentleman—knows how this process question expands to fill a universe with its details and philosophy. The catalogue is a similar expansive subject. I could easily find material for a large weekly publication for an indefinite period of issues on this one subject. Like the brook going on forever, the history of the catalogue will continue to be made after we are gone. It will move on and on as the exponent of present needs, and needs which leading aggressive minds are ever trying to impose upon their fellows.

What the catalogue ought to be the catalogue will tend to become. Improvements will be made looking to less narrowness and partiality, less deception, more general usefulness.

The era of combination will yet influence cataloguing in a very interesting way. Trade-paper advertisements are the prophecies as well as the advance agents of catalogues. There are many luxuries we can not afford, but which in the advance of the arts we become able to use, and find them economical. One of these luxuries is advertising space in the trade journals. I am in favor of putting catalogues into that space to a very large extent. Now, valuable as this space is, it is most wastefully used after it is bought. The thought and care necessary to make catalogues exactly to the point, and then put them into the columns of good trade journals, is my idea of the era of combination which is approaching in the history of catalogues.

This is one of many profitable things which it will pay to do, but which in our clumsiness and preoccupation we have not yet seen the way clear to do. Time was when a pioneer went overland in a "prairie schooner" labeled "Pike's Peak or Bust," but now he goes passenger and freight by the trains of the common railroad. A good trade journal is such a system of regular trains. It is cheaper to pay fare and freight on them than it would be to make your own wagon and travel by a team of your own. But the method of individual circularizing, while available to a limited extent, is as a whole as inferior to the use of a reliable trade journal as a prairie schooner is inferior to the Overland Express.

This is the most important conviction I have to offer on the subject of catalogues, and it is not theorizing. It comes of keeping tab on results. But the ability to travel to advantage will not alone make us good business men. We have yet to use the opportunities offered by the trade journal with more care, thought and conscience. Then they will pay for the cost of travel by them.

Mineral Wealth of China.

NUMBER II—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by
F. R. WARDLE.

Passing to the next tier of provinces south of Shantung, we enter the so-called "sphere of British influence," claimed to extend westward from the coast for 1000 miles inland, along the course of China's mighty river, the Yang-tse-Kiang. The Yangtze valley extends westward from Shanghai through the rich mineral provinces of Honan, Hunan and Hupeh, for some 800 miles to the famous gorges at Ichang, which is the imposing gateway to the province of Szechuen, 100 miles beyond. This immense territory is the richest and most productive portion of the Chinese Empire; therefore, the English have tried to grab it, according to their custom. It is not quite clear sailing with them, however, as the Germans dispute England's claim to exclusive control in the Yang-tse valley, and by every means in their power are extending and entrenching German influence and commerce. When England established her Indian troops at Shanghai, "to maintain peace and protect life and property," (the usual plea), at once Germany sent her troops to the same point, and since that time neither has consented to withdraw. All these intrigues, leading up to the final dismemberment of China, must make the very gods on high Olympus hold their sides in Jovian laughter at such a philanthropic masquerade. The snarling dogs, who quarrel over their bone heap, are really very much more honest, and, therefore, a more to be respected lot.

In the province of Hunan there is a large lake, called Tungting, around whose shores are valuable anthracite coal measures, equal in quality to the best Pennsylvania products. These coal fields are worked economically by natives, and the output has the advantage of cheap water transportation to all the markets of the Orient. I hurried this coal for two winters in my Shanghai office and found it entirely satisfactory. Its price is \$14 (Mexican) per ton, equivalent to \$7 in gold.

Immense bodies of bituminous coal underlie the heavy limestone and sandstone cappings of eastern Szechuen, and wherever these have been deeply cut by the erosion of mountain streams the coal is exposed. In the voyage through the famous Ichang gorges, 800 miles above Shanghai, one frequently sees these coal veins showing in the high banks; while at Kwei-fu, 32 miles beyond Chungking, there are coal mines in successful operation by natives. This coal is mined for less than 50 cents a ton, its laid-down cost at Chungking being \$1 and its selling price \$1.50 per ton, delivered. It is a soft, bituminous coal, of excellent quality, largely used in the small metallurgical operations conducted by the natives throughout this region.

Szechuen is a splendid province—the Switzerland of China—abounding in grand scenery, rugged mountains, extensive flora and untold mineral wealth. Its people are happy, prosperous and contented. Its area is about that of France and its climate is quite as delightful. A large part of the copper used throughout the Empire comes from this region, as well as the iron, made into queer little bricks, and on the swift current of the Yang-tse thousands of odd looking craft with brick chimneys cheaply transport these products to the markets below. At low water in winter the Chinese work on the river bars, washing gold from the detritus coming down from the Tibetan mountains. When that strange, unknown country of Tibet is open to Europeans and those mountains are prospected by experienced miners the matrices of the gold will show some astonishing developments. At present Tibet is a sealed world, of which only faint rumors drift to the outside. Many have tried to penetrate to its great Llamasary at Lassa, near the northeastern slope of the Himalayas, but, with few exceptions, have either perished or been turned back.

Szechuen is the nearest approach yet open to foreigners, and that is still 2000 miles distant from Lassa. In Szechuen seven important concessions for mining have been granted to English and French syndicates, but the disturbed condition of the country has rendered work impossible. The Pritchard Morgan party visited Szechuen just before the troubles broke out and secured what is believed to be a valuable concession.

In the southeastern portion of the province of Hunan the coal fields cover an area of 21,700 square miles and contain both anthracite and bituminous coals, of which the production is already considerable. Iron and copper are abundant in these provinces, often in favorable relation to the coal. Near the city of Meng-tse lead, tin and silver are found in considerable quantities.

Within the limits set for this article it is not possible to treat the resources of south China, which is under French control. In connection with mining in China, the three chief drawbacks should not be overlooked. Unless great care is exercised through experienced advisers long resident in China, speaking the language and familiar with the sinuosities of Chinese concessions, the confiding "franquai, or foreign

devil," is likely to acquire rather costly experience. Instances of this sort are not unknown in the Flowery Kingdom, and so shrewd and experienced a mining operator as Samuel Newhouse of Salt Lake City, Utah, told me about three years ago of an expedition he was then dispatching to north China to report on an extensive mining concession in the country northwest of Pekin, near Mongolia. Some time later, when I visited Tientsin and Pekin, I inquired what had been the outcome of this enterprise and was told that the men had been recalled and the project abandoned, because of defects in the concession from the Viceroy and other disqualifying causes. Under Chinese law, all mining concessions obtained from local officials must be confirmed by the advisers of the Emperor at Pekin.

There also exists a strange superstition among the Chinese that deep mining disturbs the "fengshui," or spirits of the air and water. "Fengshui" influences everything in China—the building of houses, the burial of the dead, and all the multifarious activities of daily life—and it does this in so many changing and elusive ways that the Western mind can not follow all the turnings. "Fengshui" has, without doubt, been the most powerful deterrent force that has checked the exploitation of China's great resources.

Another great drawback is the corruption and insatiable greed of the official or Mandarin class, without whose constant and heavy bribery nothing can be accomplished by foreigners. The case is known to me of a valuable gold-bearing quartz ledge, containing profitable values in sulphurets, which was bought by an American company and equipped at large expense with a most complete and modern plant. It was good property and with a confirmed title, clear and strong. The Viceroy of the province and the Taotai of the district were "canny," as the Scotch say. While money was being poured into plant and equipment, these officials, like Brer Rahhit in Uncle Remus' story, "laid low and said nuffin," hut, as soon as the mine started up for steady work, these Chinese began such a comprehensive system of extortion and harassment that the whole profits of the mine were absorbed, and the owners sold out the property and left the country in disgust.

When the wise Solomon named "three things that were never satisfied," he should certainly have included the Chinese Mandarin—always crying: "Give! give! give!" A witty army officer's wife, living at a lonely post, where the enlisted men were continually getting drunk and hawling, exclaimed in despair: "How lovely the army would be if only there were no soldiers!" In like manner, it may be said that China would be all right if there were no Chinese. To Europeans who dislike dirt, moral and material, the interior of China, far from treaty ports, is a hard proposition. As they say out there, "It is not good enough."

After its long sleep of 5000 years, great changes are now impending in China. The partition of its seaboard provinces must inevitably come within no distant period, and the long-locked doors of this rich treasure house will swing open to the world; then the Middle Kingdom will take front rank among producing nations.

Introducing Solvents into Boilers.

The illustration shows a simple device, which any engineer can easily construct, for pumping solvents into the boiler without passing through the pump. Referring to the illustration, A is a section of big

Arrangement of Pipes for introducing Solvents.

pipe—say 6 inches in diameter and 30 inches long—which is to serve as a reservoir. This connects with the feed pipe running from the pump to the boiler, by means of the pipes B, C and F, which are so arranged that they connect with the feed pipe on opposite sides of the stop valve D. Over the reservoir is a funnel, K, by means of which the reservoir, A, can be filled through the valve H. The reservoir, A, is provided with pet cocks, a and b, at the top and bottom, so that it may be readily filled and emptied. A union is provided at C, to facilitate the assembling of the

pipings. (A right and left elbow, of course, may be used instead, if it is preferred.)

The device is used as follows: The reservoir A being empty, valves E and F, and pet cock b, are first closed, and valve H and pet cock a are opened. The soda ash solution is then poured into K, until the reservoir A is filled. The valve H and the pet cock a are then closed, as well as the valve D, in the main pipe. Valves E and F are then opened, and the pump is started. The device is then in the condition shown in the engraving, and the water from the pump passes through B, C and A, as shown by the arrows, sweeping the contents of A out into the boiler.

When the pump has been run long enough to thoroughly remove all soda ash from A, valve D may be opened, and valves E and F closed. The reservoir A is then emptied by opening pet cock h and either pet cock a or valve H, and the device is again ready for operation.

Boats for Prospectors.

A great deal of prospecting for woods and metals is being done this year along the bays and inlets of the shores of British Columbia. Herbert Carmichael, government assayer, says of the prospectors' boats:

These craft were built of a considerable size con-

Prospector's Boat.

sidering that they were invariably cut or dug out from a single cedar tree, being often 40 feet long by 1 foot beam, but it must be remembered that a canoe with 7 feet beam could be made out of a cedar having a diameter of only 6 feet.

This was accomplished, after hollowing out the canoe by fire and chipping, by filling it with water and heating the water by throwing in hot stones; then, while the wood was soft and pliable, forcing out the sides with sticks acting as stretchers.

A danger is always present with cedar canoes. They may split in a sea from end to end. This is more liable to occur when the canoe is old and the bottom has worn thin.

It is doubtful if sails were used by the Indians before the advent of the white man. Those used now are a sprit sail of rectangular form with a long gaff. This is kept from falling off the wind by a line from the peak—in fact, it is the end of the main sheet carried to the peak and forming a loop.

It appears to be only a matter of a few years till the canoe, as now used, will disappear and the Columbia river boat will take its place. The Indians are getting quite expert at the building of these boats, which are usually from 20 to 26 feet long.

Platinum in Wyoming Copper

Mining and Metallurgical Patents.

Patents Issued October 21, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

METHOD OF RECHARGING SMELTERS' CRUCIBLES.—No. 711,468; G. B. Brown, Reading, Pa.

Method of recharging smelters' crucibles, consisting essentially in applying protecting shield to hot crucible immediately after its molten contents have been poured out, then recharging shielded crucible preparatory to removal of shield and introduction of newly charged crucible into smelting furnace.

ASSAYER'S FURNACE.—No. 711,554; A. C. Calkins, Los Angeles, Cal., assignor to F. W. Braun & Co., Los Angeles, Cal.

An assayer's furnace comprising sheet-metal floor B with openings h therethrough; sheet-metal walls or jacket extending below floor; door hinged to under side of floor to close opening b; fire-brick inside sheet-metal jacket formed by walls and floor; removable fire-clay mixture which rests upon trap-door; means by which trap-door is held up in place; strengthening bar equal in length to width between downward extensions of side walls of furnace below floor thereof, provided at each end with downwardly extending leg e provided with holes e' therethrough; bar also provided at mid-length with downwardly projecting boss or leg e'', bottom of which is in same plane with bottoms of side legs; depth from top of bar to bottom of legs being equal to space between under side of floor and bottom of downward extension of side walls of furnace jacket; rivets inserted through downward extension of side walls of furnace, also inserted through side legs respectively and riveted to hold downward extension of side walls against leg e, bar being located between mid-length of floor.

ORE GRADING APPARATUS.—No. 711,650; F. W. Wood, San Francisco, Cal., assignor to Crown Gold Milling Co., San Francisco, Cal.

Grader comprising frame, box or casing having plurality of flat or plane bearing faces, balls on which bearing faces rest, brackets secured to frame, flat bearing plates supported by brackets, in turn supporting balls, retaining rings or flanges carried by plates encircling balls for allowing them limited movement, means for imparting gyratory movement

to box, means whereby extent of movement may be varied.

PROCESS OF REDUCING METALS FROM THEIR ORES.—No. 711,738; M. Ruthenburg, Philadelphia, Pa.

Continuous process of reducing magnetic iron oxide to metallic state, which consists in coating each particle of mass of comminuted ore with reducing material sufficient to reduce that particle; fixing coating separately upon respective particles, by detaining them for definite time in region heated to determined degree less than reducing temperature; retaining preheated material in granular form and progressing it at determined rate into region heated to reducing temperature; reducing ore to metallic state, without fusing it; progressing reduced metal, in granular form, at reducing temperature, into region of fusing temperature and fusing reduced metal.

ORE CONCENTRATOR.—No. 711,903; L. Look, Los Angeles, Cal.

Ore concentrator comprising suitable framing, swinging frame, divided rod journaled on framing, supporting frame mounted on inner ends of divided rod having crank whereby swinging frame is suspended, loose pulley mounted on rod, table mounted on supporting frame, having discharge tube provided with worm wheel within swinging frame, shaft journaled in swinging frame, carrying worm meshing with worm wheel, pulley fixed to worm shaft, connected with rod pulley, vertical rock shaft having fork engaging crank on rod, provided with lateral rod, auxiliary shaft provided with fixed pulley, wheel having wrist pin, arm connecting wrist pin with lateral rod, countershaft having fixed pulley connected with rod pulley, driving shaft having fixed pulleys connected with pulleys of auxiliary and counter shafts.

ART OF BLASTING.—No. 711,545; G. Thomson, Elizabeth, N. J.

Improved mode of blasting, which consists of introducing within blast hole an electric furnace and closed vessel containing liquid, closing hole by suitable tamping, passing suitable current through furnace to generate great quantity of heat, continuing this heat un-

til surrounding rock is heated to high temperature and liquid vessel is opened by heat, whereby to liberate liquid and introduce latter into contact with heated mass so as to suddenly vaporize it, whereby there is generated within hole a pressure sufficient to disrupt mass of rock.

DRILL FOR OIL OR OTHER WELLS.—No. 711,506; W. E. Johnston, Conocoquenessing, Pa.

In reciprocating drill, combination of head or body portion, pivoted pickarms extending downwardly from head or body portion, cylinder, means to detachably connect it to head or body portion so that cylinder will depend therefrom; plunger in cylinder, links connected to plunger, means to detachably connect links to pivoted pickarms.

MINING MACHINE.—No. 711,643; R. E. Noble, Chicago, Ill.

Device comprising frame carrying toothed circular extension on its rear, shaft journaled therein carrying gear wheel, means carried by frame for actuating gear wheel, cutter chain frame pivoted to extension, shaft with gear on lower portion engaging toothed extension, means actuated by gear wheel carried by extension for actuating shaft of cutter chain frame, disk in shaft of extension, drum carried at rear of frame, ratchet wheel connected to drum, double swinging arm pivoted to shaft of drum carrying pawl for engagement with ratchet wheel of drum, arm supported on frame connected to double swinging arm, pitman pivotally connected to arm on frame and to disk, rope connected to drum and to stationary point, whereby entire machine may be moved when drum is operated.

METHOD OF MAKING SODIUM CYANIDE.—No. 711,910; F. Roessler, Frankfurt-on-the-Main, Germany, assignor to the Roessler & Hasslacher Chemical Co., New York, N. Y.

Method of obtaining sodium cyanide, which consists in treating mixture of sodium cyanide and sodium carbonate with sufficient water to bring all the salts into solution, forming lye, evaporating lye in vacuum to degree of concentration at which only sodium carbonate is precipitated, separating precipitated sodium carbonate from solution, depositing crystals of sodium cyanide by cooling, fusing crystals of sodium cyanide in their water of crystallization at about 33° C., whereby cyanide is separated in state free from water.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The Oceanic Co. will put in an extensive milling plant on its properties on Sum Dum bay, about 40 miles from Juneau. The properties are located upon two veins, each about 60 feet in width. The development work consists of tunnels and open cuts that disclose ores running in value as high as \$30 to the ton. The company proposes to place a stamp mill with a capacity of eighty tons per day.

The report of the Alaska-Treadwell Co., on Douglas Island, for the year ending May 15, 1902, shows that during the ensuing twelve months there were mined and milled 682,983 tons ore. From the mill tailings were saved by concentration 12,408 tons sulphurets. Free gold from amalgamation in the mill produced \$665,591; 12,660 tons sulphurets treated gave \$639,129, a total of \$1,304,720.

The 300-stamp mill, using water power exclusively, run 214 days 6 hours 6 minutes, crushing 308,632 tons; the 240-stamp mill ran 338 days 23 hours 53 minutes, crushing 374,261 tons; average duty, 4.80 tons per stamp per day in the 300-stamp mill, 4.60 tons in the 240-stamp mill. In the 240-stamp mill steam was used for power 139 days 19 hours 17 minutes, and water for 199 days 4 hours 36 minutes. In the 240-stamp mill one pound steel in the shoes crushed 4.33 tons of ore; in the 300-stamp mill, 4.29 tons. In the 240-stamp mill one pound of iron in the dies crushed 7.88 tons of ore, and in the 300-stamp mill 5.60 tons.

ARIZONA.

COCONINO COUNTY.

The Anita C. Co. of Williams owns 300 acres of copper-bearing land, the ore carrying 3% copper and a little gold and silver. A roasting furnace will be put in.

COCHISE COUNTY.

In the Copper Glance a 90-foot wide boulevard has been laid out from the shaft to Glance station. The El Paso & Southwestern Railroad Co. will build a spur to the mine.

The Wilcox S. & R. Co. has organized to build a customs smelter at Wilcox; incorporators, W. W. Robinson, Tucson; A. Meyer, J. Rinner, H. Brower, E. W. Armstrong, San Francisco.

At Douglas, the Calumet & Arizona furnace will blow in on the 15th inst.

The final payment of the purchase price, \$35,000, of the Last Chance mine has been made by the Canon Copper Co. J. H. Page is manager.

The gallows-frame, 26 feet high, has been completed on the Modern Copper Co.'s property. The company will drill 111 feet below the 90-foot level. An assay taken from the 90-foot level averaged \$37.04.

GILA COUNTY.

Superintendent A. C. Sleboth of the Lake Superior & Calumet M. Co. is developing property on Queen creek.

Superintendent G. S. Adams of the Globe-Boston C. M. Co. is extending the 200-foot level of the Mallory mine and will sink the shaft 250 feet farther, to a depth of 450 feet.

GRAHAM COUNTY.

The Maravilla M. Co. is pushing prospect work in the Lone Star, north of Solomonville. Twenty-five men are sinking the shaft, which has reached a depth of 400 feet with two crosscuts. Several bodies of copper ore have been found.

MARICOPA COUNTY.

L. L. White, near Wickenburg, is developing the Dark Horse mines, owned by the White G. M. Co., in Black Rock district, on the Hassayampa river. A

tunnel, now 600 feet in, is being driven. The ore body is 2½ feet wide; ore values range upward from \$4 gold per ton. The ore is about half free milling and half concentrating.

G. M. Fowler has organized the Arizal G. M. Co., which owns a number and has bonded the rest of the Selso Gradillas mining claims, 12 miles south of the old Vulture mine.

MOHAVE COUNTY.

Early in 1903 J. P. Wallace will begin operations on the Burro mine. A wagon road will be constructed to the Big Sandy and machinery hauled.

Manager O. Kuencer of the German-American Co., San Francisco district, says there are 200 men working in the camp at present. Both the Gold Roads and Leland mines are putting on more men.

PIMA COUNTY.

The Black Warrior Copper Co. will construct an additional 200-ton leaching plant and a 50-ton blast furnace. This will give a combined capacity of 450 tons per day.

W. T. Johnson has bonded for \$50,000 the Ajax hill properties. F. S. Barnum will superintend development work.

PINAL COUNTY.

The first oil in the territory has been found near Florence, which city announces that the Paraffine Oil Co. has a small flow of oil at 700 feet.

YAVAPAI COUNTY.

The Senate mine, adjoining the Congress, is being developed. In a drift on the 340-foot level 6 feet ore has been found.

The Pfau G. M. & R. Co., of Cincinnati, has bought for \$10,000 a group of claims in Cherry Creek district, south of the Gold Ring and the Hettie mines.

A. L. Begbie, representing a Scotch syndicate, has been examining the Copper Chief mine, and it was locally stated that the Scotch people had concluded to take the property. The Los Angeles Mining Review says: They learned that Senator W. A. Clark of the United Verde mines owned the property adjoining the Copper Chief; they also learned that Senator Clark owned the railway between Jerome and Jerome Junction, and, owing to these facts, became alarmed that Senator Clark would some day or another, and whenever it suited his convenience, get them in the "door" and hold them there. They thereupon called everything off, and in doing so lost the best developed prospect in Arizona to-day. The price fixed upon for it was \$1,325,000. There is a probability that Senator Clark will decide to buy it, if he gets the chance.

The Great Verde Co. has a shaft down 225 feet and are sinking through a gravel formation. This is the property on which a mineral indicator, or divining rod, says there is a body of mineral somewhere below the surface, notwithstanding there are no surface indications of a mineral ledge anywhere on the property. The owners still have confidence that when they strike solid formation they will find pay ore.

The Black Hills Co. continues to develop its property south of Jerome with excellent results.

The Monarch Co., in the Cherry Creek district, will add five stamps to their mill.

W. Treadwell has bought one-half of the Picnic group, near Mayer, carrying gold, silver and copper, and will work the claims.

The fire at the McCabe mine has been extinguished by the use of steam. Foreman Massey is given the credit. The main trouble was on the 300-foot level. To that point, down the steam pipe that connected with the lower pumps, he lowered a stick of dynamite and blew the side out of the pipe. Then all the steam that it was possible for the boilers to make was sent down, escaping just where it was needed. All surface openings were tightly sealed. The fire was confined to the timbering of the 300 and 400-foot levels.

The mills on the Congress mine are running almost full time, being hampered somewhat by the deficiency in the water supply. About 500 men are employed. The two principal veins are being developed by six shafts, and a new one has been sunk to a depth of 800 feet and shows more and better ore than the average.

A Jerome report states that over 100 men are kept busy working around the smelter of the United Verde. New machinery is being put in place and the works are being put in good condition generally.

The mine and cyanide plant at the Octave mine in southern Yavapai county is being run to their fullest capacity. About 200 men are employed about the mine and the plants.

The Prospect says the Geo. A. Treadwell Co. has secured the old Boggs mine and the Hackberry, 1 mile west of the

smelter. They also have a pipe line and control of water. It hears that the consideration was \$200,000. E. D. Treadwell will go to work at once on the Boggs. The men are now down 300 feet on the Iron Queen.

CALIFORNIA.

A compilation issued by L. E. Aubury, State Mineralogist, shows the total value of all the minerals produced during the past fifteen years to have been \$346,023,688, of which \$213,990,369 was gold, \$22,375,803 petroleum, \$19,788,337 copper, \$17,918,249 quicksilver, \$12,631,466 silver, \$10,458,649 borax, \$7,513,372 granite, \$6,111,005 clay, \$5,210,070 lime and limestone and \$4,069,548 coal.

ALAMEDA COUNTY.

The six oil storage tanks at Melrose, capacity 14,000,000 gallons, have been completed. The erection of the pumping plant has begun.

AMADOR COUNTY.

The U. S. Supreme Court has ordered a rehearing of the case of the Kennedy M. & M. Co. vs. the Argonaut M. Co., on a writ of error from the California Supreme Court. The Kennedy Co. in 1895 took \$56,000 worth of ore out of the Silva mine. The Argonaut Co. claimed ownership of the ore, because it owned the claim adjoining the Silva, containing a gold vein, having its apex there and dipping toward the Silva, and that the ore was obtained from that vein.

BUTTE COUNTY.

The Blue Lead mine, near Bangor, is to be reopened.

CALAVERAS COUNTY.

The Parnell mine has been closed on account of non-fulfillment of contract. H. S. Messer, owner of the property, has charge of it.

C. P. Williams has begun work on the Claxton mine.

EL DORADO COUNTY.

At the Golden Gate mine Superintendent Richards has a 7-foot ledge of ore.

FRESNO COUNTY.

Superintendent J. Beck of the Minaret mines says eleven men are doing development work. He will start two tunnels to connect all the claims in the group, opening some of them at a depth of 3000 feet. There is abundance of water for power and timber.

INYO COUNTY.

Near Independence, twenty-five men are grading for the new mill at the Reward mine.

Near Bishop, seventeen men are employed by Superintendent Pidge in the Leidy mine, the borders of which have incorporated under the name of the Leidy M. Co.

MADERA COUNTY.

At Grub Gulch Superintendent J. E. Porter in the Gambetta mine has the east drift on the 800-foot level in 440 feet. Shoots are put in every 50 feet and men are put on as fast as there is room for them. After a run of sixty hours, using a 60-mesh screen, \$1800 was taken off the plates and from the trap.

MONO COUNTY.

The Sweetwater M. Co. will run a 200-foot drift and put in a concentrator and slimes plant in the spring.

NEVADA COUNTY.

The Grass Valley Tidings-Telegraph says all the litigation between the Pennsylvania M. Co. and the Grass Valley Exploration Co. is at an end. The Pennsylvania Co. comes into the possession of all property owned by the Grass Valley Exploration Co., including the W. Y. O. D. mine, its hoisting works, 20-stamp mill, concentrators and all the buildings and machinery; the Kate Hayes, Nuttall, Parr, Sims, Grant and New York mines, the mineral right to the Harry ranch, Oliver claim, Crescent mine, and mineral rights of some city lots. Pumping out the W. Y. O. D. from below the 900 level, to which the water was allowed to come, will be proceeded with. It is estimated that it will take at least two weeks to get the water out of the 1100 level, when work will be resumed. The 20-stamp mill of the W. Y. O. D. will begin later on. There is enough ore in sight to keep the 10-stamp mill of the Pennsylvania and their new 20-stamp mill in constant operation. When the water is pumped out and the work of extracting ore is done from the W. Y. O. D. shaft, more men will be put to work.

A new 10-stamp mill for the Grey Eagle mine is at Nevada City.

The Union Blue Gravel mine, North Bloomfield, is to have a tramway in the tunnel.

The Union says the company recently formed to open the South Idaho mine, before unwatering the mine, will construct a dam across Wolf creek at the head of the Stone-Griffith ditch.

PLACER COUNTY.

The Rocky Bar M. Co., North Fork

American river, will clean up the river bed next year by a flume and the aid of their dam.

PLUMAS COUNTY.

E. B. Kimball, representing W. P. Hammond, of Oroville, is examining the Hallsted mine, Rich gulch.

SAN BENITO COUNTY.

At San Jose is organized the New Cerro Benito Q. M. Co.; capital stock, \$2,000,000; \$850,000 subscribed. The company proposes to buy and operate the Cerro Benito quicksilver properties.

SAN BERNARDINO COUNTY.

A ledge of chrysoprase is reported discovered on the desert near Sugar Loaf. It is an apple-green variety of chalcedony, colored by nickel oxide and of possible value in certain tints and hues, being classed with gems.

The Dale correspondent of the Los Angeles Mining Review says the Brooklyn is working night and day, both in mine and mill, handling a fine grade of ore which is being successfully reduced in the mill; the tailings are handled in the cyanide plant recently erected.

H. Ahrens is superintendent Wright & Lawrence M. Co., owning mining properties in Riverside mountain. He has bought the river boat Aztec and will use it in general transportation business, making a trip every forty-eight hours. The ore is copper, averaging 20%, and carries \$10 gold. There are sixteen claims, about 1½ mile from the Colorado. The company will erect a 50-ton water jacket on the river bank.

At the Giant Ledge Co., New York mountain, men are uncovering ore.

The mill on the Gold Bronze mine, at Vanderbilt, is running a 12-hour shift on ores running \$100 per ton. The same company is doing exploration work in the St. George mine with twenty-five men.

SHASTA COUNTY.

S. Ball, foreman Modoc Chief Quicksilver Co., Clover creek, says he has quicksilver ore on that property, and that some samples gave assays as high as 27.5%.

Manager Clark of the California Prospecting & M. Co. is working the Skookum property at Centerville.

J. H. Kendall of the Mount Shasta Mines Co., that has recently acquired the De Lamar property, says after Jan. 1, 1903, the wages of the miners will be \$3 a day instead of \$2.75, the present scale.

The Bully Hill mines and big smelting plant will be lighted by electricity and the plant operated by electric power by Jan. 1, 1903. It will carry 20,000 volts and will be 18 miles long.

The new tramway at the Bully Chooch mine is in operation with increased facilities for handling ore. The present force will be increased to fifty men. A new 10-stamp mill is in operation.

The Redding G. & C. M. Co. has bought the Future placer mine, Buckeye, and the Quartz Gulch mine, Centerville.

Development work begins on the Afterthought mine, held under bond by the Great Western G. M. Co. W. G. Scott is superintendent. Most of the men laid off at the Liberty mine, near Copley, will work on the Afterthought.

The Hiatt mine, A. Morgan superintendent, Quartz Hill district, 5 miles north of Redding, will be reopened Nov. 1. There is a hoisting plant on the property.

F. Hall and A. H. Bigbie have visited the Arps group, near Copper City. The former holds a bond on the property. The latter has been examining it for Eastern people who may become purchasers.

SIERRA COUNTY.

M. Anderson of the Gold Valley M. Co., near Downieville, says that the property of the company will start with increased force next week.

TUOLUMNE COUNTY.

The Dead Horse extension vein, back of Old Town, is considered found. Sinking will determine the best place to erect the hoist.

Sinking is completed at the Grizzly and drifting along the vein for the shoot begun on the ninth and tenth levels.

The shaft at the Del Monte mine is down 100 feet. Water is coming in, about 100 skips a day being hoisted.

In the shaft of the McAlpin mine, on Pino Blanco mountain, Superintendent Riggs will put in new machinery.

At the Cosmopolite mine the machine drill makes about 15 feet per week. J. M. Merrill is operating the mine.

The Sierra G. M. Co. is enlarging the shaft, which will be two compartment. Carpenters are at work on the buildings.

Near Jupiter, the Stockton Gravel M. Co., in the old works, are having a bed-rock tunnel run in on the gravel for some distance, when they intend placing several tons of powder and firing it to loosen the ground so that it will wash easier and more quickly. They have a 45-foot bank of gravel which washes very readily and

20 feet of hard, blue cemented gravel which needs to be broken up with powder and pays well. W. Tucker is superintendent.—The Bourbon mine has resumed.

E. J. Olson, superintendent Star mine, has finished the flume, laying the battens, caulking the flume and rebuilding the car-track. The ore bins at the mill and mine have been repaired.

The Don Pedro gold mines are under bond to W. H. McClintock. They comprise the Don Pedro quartz mine, Stokes mill site, Pay Day mill site, all in Don Pedro Bar district.

It is expected that work will resume in the Arbona mine near Tuttletown. The shaft on the Grizzly is down 1000 feet. Men are at work on the Temescal mine. Twenty stamps at the Confidence mine are daily crushing high-grade ore.

The Independent says Superintendent Scott is considering oil at the Black Oak mine. Tanks have been ordered of 12,000 gallons capacity. The mine will use 1400 gallons per day; it is now burning sixteen cords of wood daily. The cost of water is \$800 per month and wood \$3000. The north drift from the 1045 incline shaft is 345 feet and in ore averaging \$42. The south drift from the 1300 is 247 feet in ore averaging \$11.

YUBA COUNTY.

The War Department has accepted the bid of the Atlantic, Gulf & Pacific Co. for \$27,940.50 for the construction of the first of the restraining river barriers near Daguerre Point; the contractors' work on dam will begin at once.

G. Williams is manager Honeycomb quartz mine, near Camptonville. He will build a 10-stamp mill there this winter.

Work has been resumed at the Honeycomb mine.

Kirkpatrick & Crocker of San Francisco have bonded a quartz mine at Indian Ranch, on which is a \$30,000 plant; active work has been begun.

COLORADO.

ARAPAHOE COUNTY.

(Special Correspondence).—The Colorado Zinc Co., of Denver, is installing a new dryer which will give them increased capacity. For some time past they had difficulty with their screens for sizing, and have finally put in submerged screens—an invention of Superintendent King. Denver, Oct. 25.

BOULDER COUNTY.

The Longfellow mines, at Jamestown, is owned and operated by the New Century Co. They have a fifty-ton concentrating mill, air compressors, drills run by electricity, mine lighted throughout by electricity. The 200 H. P. is developed by a water power plant, 2 miles from the mine, electricity being transmitted over a three-phase wire system. Shipments of concentrates for the last year have averaged \$55 per ton; smelting ore has run \$80 per ton. The main shaft of the mine is 350 feet deep.

At Wall street the Nancy Co. contemplates construction of an electric tramway from and through the Nancy tunnel to the ore bins of Wall Street G. Ex. Co. plant—3000 feet. The chlorination plant of the Wall Street G. Ex. Co. is finished crushing ore this week.

CHAFFEE COUNTY.

C. E. Noble of the Washington G. M. Co., Granite, has 18 inches of gold ore, picked samples of which assay \$1000 to the ton. The specimens are from the strike in the 175-foot level west of the shaft. It extends along the drift for 125 feet.

D. M. Nichols, superintendent Vivandiere, has a lease on the Crete, Turret district. The Anaconda working shaft is being timbered.

The buildings at Cameron were destroyed by fire last week. They had been purchased by the Sunset Con. Co.

The station that is being cut in the Jasper shaft at the 150-foot level is to be 9x10 feet and entirely on one side of the shaft, and timbered with square sets and lagging, the timbers being 10 inches square. In cutting this station the pay streak in the vein was cut and the ore found to be rich. As soon as the station is complete sinking will continue in the shaft and the vein prospected to establish stopes and take out ore for shipment. Assays taken on ore from No. 2 of the group, on which a tunnel is being driven, show values aggregating \$50 per ton in gold, silver and copper.

CLEAR CREEK COUNTY.

Manager Wilcox of the Waldorf mine near Georgetown is shipping. First-grade ore returns average \$73 per ton and second grade \$35 per ton. The company's property totals 1000 acres.

Manager B. C. Catron has reopened the Terrible at Silver Plume.

The Poorman shaft at Freeland will be sunk 300 feet.

The Georgetown Courier says three partners in the Haggart & Co. lease made \$800 each as clear profit during the past

month; a very fine showing for the Alliance and the lessees.

Munroe, Rogers & Haynes have bought the Teller group. John Owen will be manager.

The Union group of claims on Silver mountain is sold for \$35,000 to Kansas and Nebraska men. J. M. Black will have charge.

Six miles north of Georgetown A. E. Reynolds, on the Red Elephant group, projects extension of the tunnel another 1000 feet to intersect and exploit property.

DOLORES COUNTY.

Two hundred more miners will be working in Rico and Pioneer mining districts within the next ninety days, says the Rico News.

Under the direction of A. B. Roeder, the United Rico Mines Co. has been organized and will operate a number of concentration mills.

FREMONT COUNTY.

Florence says that the Victor Fuel Co., operating the Chandler coal mine, on November 1 will voluntarily increase the wages of its employees 5%. M. W. Lewis, labor agent for the company, has gone to Arizona to get more negroes to work in the mines. At present there are 120 darkeys employed.

GILPIN COUNTY.

The Powers M. & M. Co., own and operates the Powers, Hope and Cresceus lode claims, situated in Russell district. The Powers will be used as the main working shaft of the group; this shaft is down 240 feet. Drifting and stoping is being carried on in the 220 east and west levels, the west level showing 3 feet of ore.

Best & Clayton of Idaho Springs have a lease and bond on the Great Mammoth mine in Illinois-Central district, and the lessees will put on a small hoisting plant.

The Alps mine on Quartz hill is worked by a pool of Central City and Nevada mine miners under the management of J. Williams. The main work is being carried on between a depth of 1200 and 1300 feet, where stoping and raising is in progress. This property has two shafts, the main one being 800 feet deep, and from that depth a shaft has been sunk below the level, which is down 500 feet and is called the submarine shaft. The property ships enough ore to supply one battery at the stamp mills and is of fair grade. The smelting ore brings over \$100 per ton, being yellow copper and black jack. The property is owned by H. Sayr of Denver and is worked under a lease.

For the third week in October the shipments of ore from the county amounted to 101 cars, or 2020 tons, bringing the total for the three weeks of the month ending the 23rd up to 309 cars, or 6180 tons.

The Carpenter smelter at Golden has taken off from its treatment charges the silica penalty on all ores running up to \$15 per ton, all above that grade to be charged for excess silica as at present.

The Delmonico mine on Quartz hill has its shaft nearing the 1000-foot point. The company intends to sink 400 feet deeper.

Lessees of the Fannie mine on Cyclops hill, west of Black Hawk, are taking out some silver ores carrying 200 ounces to the ton.

The Hidden Treasure mill on North Clear creek has a 100-ton lot from the North Star property in Vermillion district, operated by the Ann Rutledge M. Co.

Manager Nickerson of the Fairfield G. M. Co. says that the last car of smelting ore from the Fairfield mine in Russell district gave returns of \$149 per ton—an increase of 23% over the returns from the previous shipment. These ores were taken out in development work, in sinking the shaft and in starting off the drains at the bottom.

GUNNISON COUNTY.

(Special Correspondence).—The Ethel G. M. Co., of Denver, will soon erect a hoist on their property at Vulcan. Vulcan, Oct. 25.

The Akron M. Co.'s 2800-foot drainage and transportation tunnel is now in 2300 feet and will furnish an economical avenue of extraction for the ore bodies in Lake hill. The management is in charge of E. R. Harper, ex-Mayor of Akron, Ohio.

The Ute Trail M. Co. has organized under the laws of Wyoming; incorporators, J. A. Freeman, J. A. Beam, M. S. Brown, who hold a lease and bond on the Ute Trail mine. A carload of ore shipped for testing purposes shows one to four ounces in gold.

Near Pitkin, Superintendent Severson on the Calumet is proving up the vein which apexes in the center of Calumet ground.

Near Gunnison, J. McElroy is operating the Bon Ton lode. The ore runs 8% copper and 70% lead. The Hard Cash on Ga-

lena mountain is showing a fine body of copper ore. The Lead King, in the same district, is being operated by Aspen men with good results.

LAKE COUNTY.

The Last Chance mill, Lake county, is being fitted up to treat ore from the Peerless Maud; treat fifty tons per day. Manager Dyatt points out that the main reliance of the Horseshoe district is on the low-grade milling ores.

By November 15 the new mill at the Resurrection mine at Leadville will be completed and ready to treat ore.

The California Gulch Gold Dredging Co. will work the Uintah placer, west of Leadville, next season. A dredging plant costing \$60,000 will be put in. The Uintah placer lies between Stringtown and Malta and contains about seventy acres. The company have been experimenting for some months, and report pay gravel 16 feet below the surface, although the upper wash will also carry gold. The tests showed values of 50 cents per cubic yard. All efforts to work this ground before has been done through sluicing.

At Leadville an attempt will be made to solve the problem of the treatment of the low-grade siliceous ores by means of cyanide by Golob & Turnbull of the Ballard mine, who will put in a sixty-ton plant. In the tests on low-grade ore from the Ixey mine at the plant, near the Arkansas Valley smelter, the talcose material hindered the cyanide solution from leaching through the mass. Breece hill alone can furnish a large tonnage of low-grade ore if cyanide can be made to work successfully there.

Leadville says in the Yak tunnel workings at the breast, a distance of over 12,000 feet from the mouth, the men ran out of the porphyry and encountered the parting quartzite, which is taken to prove that the Leadville formation underlies Breece hill, from which it is argued that in all of the gold properties on the gold belt where gold predominated in the siliceous ores, as well as carrying a fair percentage in the sulphide bodies (when the lower contact is struck), it will carry good values in gold. The values should also be increased in copper. In addition to the discovery benefiting Breece hill, it will also add to the value of many properties, such as the Iron Silver, Moyer, Louisville, A. Y., Minnie and others.

OURAY COUNTY.

Superintendent D. Woods of the Ouray Chief M. Co. is operating the old Portland mine 2 miles east of Ouray, new houses have been built, engines and electrical apparatus to drive electric drills and fifty-ton concentrating mill contemplated. The group consists of thirteen claims. As soon as the electric drills are installed a tunnel will cut a 20-foot vein.

Manager J. S. Reid of the Bonanza mine, Mt. Haydon, has shipped out three cars silver ore. He will start a new tunnel 1100 feet lower down to intersect the Bonanza vein 1051 feet.

SAN JUAN COUNTY.

Over 13,000 tons of crude ore passed through the Silver Lake mill last month.

Ore from the Columbus mine tested by G. H. Shank, who has a bond on the property, returns 65% in lead with lesser values in other metals.

Some specimens ore from the Dewey claim, Tiger basin, shows sylvanite and sweated its gold by a roast.

The International Reduction Co., operating the Good Hope mines at Bear creek, has been reorganized. The property will be worked all winter; it is locally thought that the Gage process reduction works will not be built until next summer.

Manager B. D. Smith of the Silver Queen mine, near Animas Forks, has a 300-foot tunnel being run to tap three ore shoots in the upper level.

The Silver Ledge mill at Chattanooga is completed.

SAN MIGUEL COUNTY.

The San Bernardo mine near Ophir loop will resume.

In Bridal Veil, White's Blue Lake group of properties is leased to Chadwick and Biapp.

SUMMIT COUNTY.

Near Frisco, the Excelsior mill has been put in shape for saving values by Superintendent Colcord.

TELLER COUNTY.

J. U. Bethell, assistant manager of the Par Value M. & L. Co., operating the Mary Cashen property, has in the upper workings 6 feet ore running \$25 a ton.

The weekly report on Stratton's Independence from September 27 to October 3, inclusive, shows the output of the mine yielded a value approximately \$40,000 for the week. On the 30th the shipments ran \$17 a ton, making a gross value of \$4142.50. The best day of the week was on the 27th, when 280 tons of \$23 ore was shipped, yielding a value of \$6440.

Operations at the Portland mine were suspended for a few days last week

for a reason rarely found in gold mining. Three hundred men were idle at the mine waiting for the timbermen to catch up on their work. The Portland employs a large number of timbermen, but the amount of work of this nature was unusually large recently and the timbermen were not able to keep up with the mining operations. The square sets of timbers now being put in at the Portland are said to be for the widest spars ever used in a gold mine. They are timbering a space 120 feet wide and carried up to an indefinite height in the big stope. The Portland has now two bodies of rich ore, one in the seventh level from the No. 1 shaft, the other in the third level from the No. 2 shaft; both bodies glisten with sylvanite.

Victor reports recent development by the Cripple Creek M. Co., lessees, on the Hull City placer and have doubled the output. Ore is being mined at the rate of 1500 tons a month, average value \$40 in gold. The Cripple Creek Co. has the shaft to a depth of 1090 feet and will sink until a depth of 1250 feet is attained. Levels will be run each 100 feet, beginning at 1150 feet. At the 1050-foot level the vein was cut about 50 feet southwest of the shaft. The chute has been opened for over 400 feet at this depth and the face of the drift is still in ore. Two feet is the average width. Screening and sorting is resorted to in securing the \$40 returns.

The Morning Star G. M. Co. has ratified the sale of the company's property to the El Paso Con. G. M. Co. for \$50,000.

IDAHO.

BLAINE COUNTY.

There are two deposits of zinc ore on Wood river, in the War Dance group, on Deer creek, and in the group on Boyle mountain. In the latter group there are bodies 70 feet long of ore that carries an average of 10% zinc, and gold, silver, lead and iron.

In Colorado the average value of 55% zinc ore to the miner, after deducting all costs, including \$15 railroad freight to Galveston, \$2 water freight to Belgium, in addition to insurance, commissions and treatment charges, but not the cost of mining, is about \$8 a ton.

ELMORE COUNTY.

F. P. Willis, superintendent Tahoma mine, at Atlanta, says that four tunnels have been run; the lowest has a depth of 400 feet; ore running \$12 a ton has been opened. The company will next year put up a Chili roller mill, 150 tons daily capacity. The Idaho M. Co., an organization of Philadelphia men, owns the old Monarch and Buffalo. The company has sunk the old shafts 200 feet deeper—total depth, 600 feet. At a depth of 700 feet crosscuts will be run to the ledge—80 feet. These have been known as silver mines, but 45% of the value of the former bullion was in gold.

IDAHO COUNTY.

At Thunder mountain the Dewey Co. has forty men employed; the 10-stamp mill is going; the company is still jealous of "strangers."

SHOSHONE COUNTY.

The Ajax M. Co., controlling eight claims near Burke, has incorporated; J. A., J. S. and A. McAlpin, J. White and J. Henry—all of Burke.

Wallace tells the Spokesman-Review that the good effects of the settlement of the lead trouble, in which every mine in the Coeur d'Alene was allowed an increase in the monthly output, has been increasing so rapidly for the past month that times are much better there at present than they have been for years. Forty additional men have been added to the force of the California Con., Nine-mile gulch. The Mammoth property has employed seventy-five additional men. The other heavy producing properties which stored away the concentrates and ore during the time the trouble was pending have cleaned up and shipped away all the surplus stock and are preparing to increase their forces.

Superintendent J. Thyne of the Golden Chest M. Co., near Murray, will put in a cyanide plant, to be managed by J. G. Forrester, late of Utah.

Manager Derby of the Monarch M. Co., 5 miles east of Murray, has, with the aid of the compressor, been making an average of 10 feet every twenty-four hours, "one day breaking the record by driving an even 15 feet," equivalent to 300 feet per month. The lower crosscut tunnel when finished will be 2900 feet long. It will tap the two main veins about 1400 feet below the surface. The power for compressor and ventilating fans is furnished by flume.

E. E. Rogers of the Gold Creek Con. M. Co., at Oro Fino, owns the Mascot group. There are fourteen claims. The company is sinking an incline shaft on the center ledge. A 10-stamp mill is on the property. Fifteen stamps are in transit.

Superintendent W. Stedman of the Paragon M. Co., 6 miles east of Murray,

will put in a hoist and 3-drill compressor to sink a double-compartment shaft 300 feet deep. The shaft has been started 700 feet from the ledge. At a depth of 300 feet a drift will be run northward 145 feet, where it is expected the vein will be met.

MISSOURI.

JASPER COUNTY.

Joplin says the mine cave-in on the 30th is assuming big proportions. In addition to the seven shafts on the Eleventh Hour tract that were utterly destroyed, the Homestead and Cleveland mines have caved in. The ruined mines were all producers and have paid a half-million dollars in dividends. Five other mines in the immediate vicinity are considered unsafe and have been abandoned.

MONTANA.

BROADWATER COUNTY.

Gold ore is reported again found in the Freiburg mine, 6 miles south of Winston. The Inter-Mountain thinks that the old California idea—that a mine is of no value until it has passed through a lawsuit—if applied to this mine, would prove it to be of incalculable value, as the history of its lawsuits and gunplays would make a book. Carloads of ore have been shipped which netted \$3000 and small lots have been sent to the smelter that ran \$35 to the sack. It is thought the mine will become a regular producer of high-grade gold ore.

CARBON COUNTY.

Red Lodge reports a strike on the Copperopolis property by E. B. Wittich of Livingston. At a depth of 125 feet a 13-foot ore body is rich in gold, silver and copper.

DEER LODGE COUNTY.

The Anaconda Co., on the hill in East Butte, is putting in a new system of drainage by which all the large mines, including the St. Lawrence, Never Sweat, High Ore, Green Mountain, Diamond, Bell, Modoc and Wake-Up Jim, are to be drained of their water through the shaft of the High Ore, which has reached a depth of 2300 feet. Seven large pumps are at work in the High Ore—three on the 1000, two on the 1600 and two on the 2200 level—and there is a 90-foot pump for the reception of the water from the other properties. The High Ore has very little water excepting that which flows in from other mines. A crosscut is being driven from the 2200 level of the High Ore to connect with the lower workings of the St. Lawrence, Anaconda and Never Sweat; when completed, the water of these three mines will flow into the pump of the High Ore and be forced to the 300 level by the large pumps there. At this point a water tunnel carries off from the pumps water formerly raised to the surface.

The Ophir M. Co. has resumed work on its Ophir mine, at the foot of Dakota street, Anaconda. It is being unwatered by the tank method.

The Edith May, Adirondack and Ticon mines, near the Speculator, are to be unwatered and a crosscut driven from the bottom to the vein which passes through the claim. There is a 700-foot shaft on the Edith May which contains good copper ore.

The Pittsburg & Montana Copper Co., organized to develop the Franklin Farrell ground east of Anaconda and to build a smelter, has the work of development in progress in shaft No. 2, which has reached a depth of 800 feet.

FERGUS COUNTY.

At Lewiston the addition to the Barnes-King mill doubles the capacity—now 250 tons per day.

The bond of the Akeley property, in Deaton gulch, in the North Moccasin, taken by E. J. Morrison, expired Aug. 1. Mr. Morrison expects to take up the bond and push work during the winter.

The addition to the plant of the Barnes-King property, in the North Moccasin, is in operation; the mill is treating 170 tons of ore per day. The capacity of the plant has been increased to 250 tons.

FLATHEAD COUNTY.

(Special Correspondence).—The Snow Shoe mine is developing into a producer. A new mill is contemplated.

All the mines on the same contact show up well. The Silver Cable, Choteau, Diamond John, Beefsteak, Way Up and Silver Butte are being operated.

The new strike at Iron Meadow, 6 miles from here, has caused a stampede. Some free gold ore, assaying \$580, has been taken out. The ledge is 14 inches wide.

Work is being carried on at the American-Kootenai mines with electric drills. A body of free milling ore has been struck.

The Brick & Brannegan mine is a steady producer. Snowsheds have been built to work all winter. New plates are put in and the old ones shipped to the smelter for the gold absorbed by them to be recovered.

Cabinet, Oct. 24.

A strike is reported in the Way-Up mine, in the West Fisher district, in one of the three tunnels by which the property is being developed; vein, 12 feet wide-ore, a sulphide that will average \$20 gold per ton.

J. H. Riley, of the Way Up mine, reports three tunnels on the property; in the two upper tunnels the ore is 15 feet wide, average \$20 gold. The ore is a sulphide; some of the gold is free. The walls are slate and quartzite, the ledge filling is shale slate.

In West Fisher district the Gold Leaf claim has cut the vein at six different places; assays \$60 in gold to the ton. The ledge is 12 inches wide, walls slate, the prevailing formation in that section. The Iron Meadow is 6 miles from Cabinet.

GRANITE COUNTY.

A strike is reported from Stony Creek, 16 miles west of Philipsburg, on the property of the Michigan & Montana M. Co., H. Ortman resident manager. The lead in the upper workings is 4 feet wide; assays average \$35 gold per ton.

JEFFERSON COUNTY.

The Helena & Livingston Co. has bonded the Muellers mine, west of Corbin, for \$16,000. Men are taking out ore.

At Corbin, Eastern men have an interest in the Hidden Treasure and Copper King claims, owned by the Colorado M. & D. Co., and will supply money to do development work. The shaft on the Hidden Treasure is 157 feet deep.

H. Freyler, manager New Boston Co.'s ground near Corbin, will develop the company's claims—all on the Badger, one of the group.

LEWIS AND CLARKE COUNTY.

The Red Bird M. Co. is organized to operate the mines of the Panches Bros., R. A. Panches manager. The mines are 2 miles northwest of Austin.

L. C. Alexander, operating the Josephine mine, at Rimini, has a shoot of ore which is assaying \$100 to the ton.

MADISON COUNTY.

At the Red Bluff mine Superintendent Austin will increase the present force of eighteen men.

Near Rochester, at the Watseca mine, there are 113 men employed. The company has one mill in operation and another in the course of erection.

At the Elgin seventeen men are working on each shift.

Ore is being produced by the Kearsarge property, near Virginia City; considerable of it carries free gold.

MEAGHER COUNTY.

W. W. McDowell, lessee and manager of the Daly copper mine, at Copperopolis, has a crosscut on the 400-foot level toward the ore body which was worked on the 300-foot level.

The Morning Star mine, at Castle, is under bond for \$50,000. W. Shakespeare is in charge and is getting out a 1000-ton shipment to the smelter.

RAVALLI COUNTY.

The Wood Placer M. Co.'s holdings near Hamilton have been sold for \$100,000. Thirty-five men will be employed. New flumes will be built.

SILVER BOW COUNTY.

H. Bush, formerly superintendent Black Gulch Co.'s property, has a lease and bond on the Ballaret group of claims in the Highland mining district, 25 miles south of Butte.

A contract for a 200-foot tunnel on the Illinois & Montana M. Co.'s property is let by Manager J. H. Geiger.

NEVADA.

ELKO COUNTY.

S. G. Weston, manager Baltimore group near Elko, says the completion of the tunnel will tap the ledge in the next 400 feet. In the same locality is the White Rock placer mine, successfully operated by Manager Hlgginbotham.

At the Bull Run group the owners, after discharging an indebtedness of \$30,000, are dividing \$6000 per month with twenty stamps dropping.

ESMERALDA COUNTY.

W. Groszinger of Candelaria has received first payment on his \$25,000 sale of coal lands.

The Silver Star Co.'s mines are reported sold to Eastern men.

EUREKA COUNTY.

Ore shipments by rail from the mines of Eureka district for the week ending October 17 were: Eureka Con. 131,300 pounds, Diamond 32,340 pounds, Lincoln 9280 pounds.

LINCOLN COUNTY.

The Nevada-Keystone M. Co., Yellow Pine mining district, on their 300-foot level have an ore body measuring 6 feet in width and assaying \$100 per ton.

At the Wall Street mine, El Dorado canyon, Manager Gracey is putting in a hoist.

LYON COUNTY.

Cutting & Hudgens have bought the Wilson mine at Pine Grove, 25 miles south of Yerington, for \$30,000—one-half cash and the other half in sixty days.

NYE COUNTY.

(Special Correspondence).—There are thirty-three two-compartment shafts now being sunk and considerable new machinery is coming in. The 60-mile pipe line has had considerable preliminary work done, about \$30,000 having so far been expended.

Tonopah, Oct. 28.

J. Healey, superintendent Tonopah & Salt Lake Co.'s properties, says in the Stone Cabin ground he has uncovered 4 feet of high-grade ore, with real extent of body undetermined.

Twenty-five men are doing development work at Southern Klondike, on the Court & Bell property, for the Tonopah Co., which is under a bond for \$75,000, which expires Jan. 1, 1903.

STOREY COUNTY.

The Kinkadee mill is now employing nineteen men, adding \$2000 to the Comstock monthly payrolls.

The drill plant on the Brunswick lode has been set up on the site selected for boring drill hole No. 3 on the line between the Potosi and Occidental. Operations on the new hole will begin when the electric power line to the plant is completed.

WASHOE COUNTY.

The Pyramid Lake M. & M. Co., F. O. Norton superintendent, is developing the property.

WHITE PINE COUNTY.

The Chainman M. Co. has temporarily suspended operations awaiting the meeting of the board of directors on the 7th. W. N. McGill is acting superintendent.

Work on the well at the Keystone is suspended, the pump pulled and other machinery removed. Water for the running of a smelter has not been obtained.

OREGON.

BAKER COUNTY.

At Imnaha, 35 miles down the Snake from a point opposite the Seven Devils, J. A. Hilliker says the work on the surface and depth so far attained indicates copper deposits. Development has penetrated below the oxidized zone on several of the properties, where sulphides running from 6% to 8% copper are revealed. Malachite running 30% to 40% copper is found in the oxidized zone, where leaching has enriched that portion immediately under the surface deposits. Sulphides come in with the water level, which ranges about 50 feet depth. The smelter recently ordered by the Eureka Smelting Co. will treat custom ores, to be located at the mouth of the Imnaha.

Gelzer people have been prospecting ancient river channels at Winterville and at a depth of 130 feet have found gold gravel, upon which they will do some drift mining.

The North Pole Co. has bought a quarter interest in the Villard claim.

Three miles from Sumpter the Gold Pan Co. will sink a 500-foot shaft. The Virginia mine will put in a new stamp mill. C. J. Allen is reopening the Monumental mine.

Near Sumpter, the quartz mill of the Cracker-Oregon M. Co. is ready for the machinery. Two drifts are being run on the ledge. The North Pole mill addition is completed. A contract has been let for a 550-foot tunnel on the Yellow Daisy property, Red Boy district. The air drills in the Oregon-Monarch crosscut tunnel are making a progress of 7 feet per day.

DOUGLAS COUNTY.

Freeport, Ill., owners are at Drew to inspect a mining property owned and operated by the Rainbow M., M. & S. Co. of Freeport, looking into the advisability of building a smelter. The trip is taken on the recommendation of Superintendent H. Banfield. The property consists of a dyke of mineralized porphyry 600 feet wide, carrying three to five paying veins.

JOSEPHINE COUNTY.

The Simmons-Cameron, Wimer, Meredith and Osgood are the principal hydraulic placer mines of the Waldo district. The managers of all of these properties are preparing for the coming winter's work. The managers of the Simmons-Cameron are driving a 1200-foot tunnel through a mountain to new diggings. They will put in a hydraulic elevator to elevate the waste and tailings, as the slope of the gulch in which the new diggings lie is not sufficient to allow dumping grounds for the giants. Three or four giants will be operated at each of these mines.

SOUTH DAKOTA.

LAWRENCE COUNTY.

A. M. Stevenson of the Hidden Treasure mine, adjoining the Homestake mine,

says it is believed to be an extension of that claim. During the six months a great deal of development work has been done and new ore bodies opened up. The report in part reads: "Crosscut No. 1, 1000 feet from the mouth of the tunnel, 450 feet at right angles to and intersecting the big Cheyenne ore body. I stated in my letter of June 8 that the development work upon the properties at that time showed free-milling ore bodies of 80 feet in width, and present development work shows an ore body 186 feet in width, consisting of free-milling ore exceeding \$5 per ton in value. A large shaft house and hoisting plant is nearing completion and a three-compartment shaft is being sunk at the west end of crosscut No. 1, west from the main working tunnel. This shaft is about 100 feet deep and in fine pay ore. Some siliceous ore bodies show an average value of \$13 per ton. The mill will have a capacity of 260 tons per day and will be in operation Jan. 1, 1903."

The Clover Leaf M. Co. is running thirty stamps at the mill, and will drop sixty; to supply the additional stamps with water, a ditch and flume have been put in to bring water from Elk creek. The ore is being mined on the lower level, 500 feet deep, where the vein has been developed by crosscut within the last few months, 100 feet deeper than the company was working a year ago.

C. C. Griggs is putting in a dryer of his own construction at the Wasp No. 2 cyanide plant on Yellow creek. It is of brick, 2x5 feet, built alongside the ore bin and reaching from the tramway to the crusher floor below, at an angle of 45°, the sides lined with 1-inch holler iron, top and bottom with 1-inch cast iron. The furnace furnishes heat for the dryer by the passage of smoke above and below the dryer twice its length before entering the smokestack. The device is to dry the shale ores to prevent their clogging the crusher. The clay from these ores is difficult to handle in the tanks, being almost impervious to the solution and rendering reasonable extraction almost impossible. The Wasp Co. ore is mined in an open cut, quartzite and porphyry lying nearly flat over 20 feet thick. It is common for one blast to break down enough ore to run the mill ten days. It is trammed 1400 feet to the mill.

At Roubaix the Uncle Sam shaft of the Clover Leaf M. Co. is 600 feet deep. The mill is running on ore from the fifth level of the mine. The company has been troubled with water above the 500-foot level. It is all caught on the 500-foot at present, and below that the shaft is comparatively dry.

UTAH.

JUAB COUNTY.

Manager Packard of the Star Con. of Tintic has made connection with a new independent vein of ore in the south drift off the 300-foot level. Assays show \$30 gold, twenty-five ounces silver per ton.

PARK COUNTY.

Superintendent J. Brooks of the California Co. concentrator at Park City expects next month to be crushing 100 tons of ore daily, producing twenty tons concentrates.

SUMMIT COUNTY.

A. J. Fern, manager Western Monitor M. Co. in Iron canyon, will work the property all winter.

Superintendent M. C. Harrington of the Keystone is sinking and will put in a new hoist.

WASHINGTON.

FERRY COUNTY.

The management of the Quilp, at Republic, has contracted to ship 600 tons of ore monthly to the smelter.

STEVENS COUNTY.

At Northport, J. Watson, metallurgist at the smelter, has three furnaces in operation and is treating about 600 tons of ore per day; next week the fourth furnace may be blown. The smelter has sufficient coke for present needs.

Near Hedley City, Similkameen, the owners of the Nickel Plate mine and group of claims are proceeding with the construction of a tramway and water flume, preparatory to installing a 60-stamp mill and concentrating plant.

FOREIGN.

BRITISH COLUMBIA.

The Cariboo Goldfields Co.'s yield is estimated for the season at \$20,000. The hydraulic elevator is working successfully. The Cariboo hydraulic's results of the second and final wash-up of the season at this mine amount to \$17,500 in gold, making the total yield of the year \$61,000. The falling off is ascribed to deficiency of water supply caused by the slight snowfall of last winter.

J. H. Moran of New Denver has bonded for \$60,000 the West Fork group in Thunder Hill camp, on the headwaters of

the North Fork, 100 miles north of Grand Forks. The ore in a 3-foot ledge gives values of \$100 per ton in silver and copper. It is owned by F. Fritz and C. W. Harrington of Grand Forks.

The B. C. mine, Summit camp, will ship 3000 tons monthly to the smelter.

The Crofton smelter, Vancouver Island, water jacket furnace is capable of handling 400 tons a day.

George A. Ohron, U. S. Consular agent at Rossland, says: "Nine mines are now shipping to the smelters in Washington and British Columbia. A few months ago only two of these were shipping, and that in small quantities. The labor troubles have now been adjusted and the mines are all working. The following table shows the average shipment for one week:

	Tons.	Value
Le Roi.....	4022	\$52,286
Le Roi No. 2.....	420	5,460
Center Star.....	1350	17,550
War Eagle.....	900	11,700
Glant.....	155	2,015
Velvet.....	150	1,950
Total.....	6997	\$90,961

"A few years ago the mines around Rossland could not afford to ship ore valued at less than \$16 per ton. The charges for freight and smelter treatment amounted to \$14. Later, these charges were decreased to \$11 per ton, and about a year ago the smelters reduced the rate for freight and smelting to \$6.50 per ton. A recent contract made by the War Eagle and Center Star mines with the smelter enables them to ship ore valued at \$5 per ton, although they ship a quantity of high-grade ore with the low grade. The terms of the contract between these mines and the smelter are \$4.50 per ton for freight and treatment. This is most important for the future prosperity of Rossland, the majority of ore mined around the city being of low grade. With these cheap rates for freight and smelting there are hundreds of mines in the immediate vicinity of Rossland which will become shippers almost immediately."

The Noble Five, near Sandon, has closed down.

In Rossland it is thought likely that the Le Roi and Le Roi No. 2 may consolidate. The Miner says that the two mines made an aggregate profit of \$81,000 in September—Le Roi \$63,000 and Le Roi No. 2 \$18,000.

Details for the Le Roi's operations are as follows: Shipped from mine to smelter 13,667 tons, containing 6778 ounces gold, 12,144 ounces silver and 580,000 pounds copper. Shipped from dump to the smelter 1998 tons, containing 660 ounces gold, 930 ounces silver and 50,720 pounds copper.

Le Roi No. 2: The shipments for September amounted to 6070 tons, containing 2645 ounces gold, 6030 ounces silver and 125 tons copper. The returns from ore, after making a reduction of all smelting charges, amounted to \$39,500; cost of mining, \$21,500; profit, \$18,000.

The Mines Exchange, Ltd., of Nelson reports from the Silver Glance that the owners have a bonanza. Four cars of ore were recently shipped to the smelter which netted about \$12,000.—The tramway to connect the Venus with the Athabasca mill will be ready for operation next month.—The Chicago National Development Co. is pushing work on the Carthage group, North Fork of Wild Horse creek; two tunnels have been run on the vein—488 and 135 feet, respectively.—A strike on the Double Standard claim, adjoining the Hunter V mine, shows ore rich in native silver.

The total amount of ore shipped from the Slocan and Slocan City mining divisions for the year 1901 was approximately, 30,000 tons. From Jan. 1 to Oct. 11, the shipments reached 22,914 tons.

A. C. Garde, manager Payne mine, has an option on the Linsay and Knob Hill groups of mineral claims, Canyon creek, Trout Lake district.

The recent discovery made on the Rossland-Criterion, owned and operated by the Ophir Lode Syndicate, and the strike on the Bearice, shows the extent of the Fish Creek Camp.

CHINA.

The ninth article of Sir James Mackay's new treaty with China provides that the Chinese government will promptly and earnestly examine the existing mining regulations, and will form new ones which shall offer no impediment to the employment of foreign capital in the exploitation of the mineral wealth of the country.

MEXICO.

CHIHUAHUA.

At Batopilas, Chihuahua, the Batopilas S. M. Co. shipped \$112,000 worth of bar silver and concentrates in September from the Todos Santos mine; it was expected that the shipments would reach \$125,000 in October. This vein has yielded

since July, 1901, \$1,500,000 silver. E. A. Quintard, a son-in-law of Gov. Sheppard, has been superintending the property since the latter's death. L. H. Stevens has been elected general manager and has gone to Batopilas.

SONORA.

The Oasis hears that the Pilares de Teras silver mines, beyond Nacosari, have been sold to W. C. Greene of Cananea for \$250,000 gold. Mr. Green will operate them upon an extensive scale. The ledge is 12 feet in width.

On the western slope of the Sierra Madres the Rio Yaqui International Transportation and Metallurgical Co., recently incorporated under the laws of Arizona, has plans for building a 24-furnace smelter and refinery at San Antonio de la Huerta and constructing 300 miles of railroad to connect the various mines owned by the company with the smelter and also with the sea coast.

San Antonio, the site of the smelter, is in the heart of the country in which the mines owned by the company are located. The farthest one is 21 miles from the smelter site. These properties will be connected with the smelter by railroads.

Work on several of the properties will begin. V. A. Lucier, vice-president and assistant general manager of the company, is at St. Louis to meet Eastern men who have become interested in the company. The party will return to Denver and leave for Mexico, where arrangements for the letting of the contracts for the building of the smelters and railroads will be made. It is expected that a number of the furnaces of the smelter will be ready to be blown within a year.

NEW ZEALAND.

The gold output of the colony for the month of September amounted to 57,783 ounces, of the value of \$222,466, as compared with 51,087 ounces, valued at \$195,696 in September, 1901.

THE KLONDIKE.

Dawson has shipped ten and a quarter million dollars in gold since the opening of navigation last May.

The statement of the export of gold from Dawson to the outside as furnished by Territory Comptroller J. T. Lithgow is as follows:

Month.	Ounces.	Value.
May.....	1,326 06	\$ 19,890 75
June.....	236,673 44	3,550,324 55
July.....	154,208 38	2,313,130 70
August.....	145,032 88	2,175,493 64
September.....	146,454 68	2,196,778 10
Total.....	683,695 44	\$10,255,617 74

Commercial Paragraphs.

FAIRBANKS, MORSE & Co. of Denver report having sold so far this season over fifty railroad track scales from 80 to 100 tons capacity.

BROWN, BEAL & Co., Mills Building, San Francisco, are now the agents of the Trenton Iron Co., Trenton, N. J., vice the late N. M. Bell.

N. A. CHRISTENSEN, formerly of the Christensen Engineering Works, has sold his interests therein and has gone into the air compressing line himself. His office is 1212 Herman Building, Milwaukee, Wis.

The Denver Engineering Works Co., Denver, Colo., have orders for one electric hoist for the Federal Lead Co.; three electric hoists for Montezuma Lead Co., Chihuahua, Mexico; one electric hoist for Mine & Smelter Supply Co.; also have orders for five electric drills and one 50-stamp mill.

HENDRIE & BOLTHOFF MFG. & S. Co., Denver agents for the New Century drop motion jig, report a rapidly increasing demand for this appliance. They are equipping the Rawley mill at Bonanza, Colo., the Ellshart mill at Chloride, A. T., the Daly Judge mill at Park City, Utah, and the Big Five mill at Ward, Colo.

THE Colorado Iron Works Co., Denver, Colo., are in receipt of orders for the following material: One two-table concentrating plant complete and one reverberatory smelting furnace for the Keystone Copper Smelting Co., Guadalajara, Mexico; a cyanide plant to be operated under the pneumatic cyanide system for Hall & McConnell, Deadwood, South Dakota; this consists of six 14-foot leaching tanks, together with gold, sump and solution tanks.

A. J. MOXHAM, late general manager Dominion Iron & Steel Co., Sydney, C. B., has bought from Mrs. E. DuPont the DuPont Powder Works at Wilmington, Delaware. The price paid is said to exceed a million dollars. The plant is the largest of its kind in the world and manufactures the bulk of the powder used in the United States, including the smokeless article. It is understood that the Haggerty Powder

Co. is about to be absorbed by the DuPont Co.

A LARGE Jeanesville pumping engine, capacity 1000 gallons per minute for lift of 1000 feet, at the Golden Cycle mine, Independence, Colo., was shipped from the factory at Jeanesville, Pa., on Oct. 10. This pump was sold by the Western office of the Jeanesville Iron Works Co., 1328 Seventeenth St., Denver, Colo., and is fitted with the latest economic improvements, such as Corliss valves, Rochester automatic power lubricator, Wyoming steam eliminator and a 10"x14"x18" steam condenser.

Personal.

J. H. HAMMOND is at Tonopah, Nevada.

R. FLEISCHER is manager Nogales M. Co., Sonora, Mex.

L. MONAHAN is foreman Iron Mountain mine, Shasta, Cal.

W. G. SWART of Denver, Colo., has returned from the East.

N. E. LINSLEY has returned to Spokane, Wash., from Alaska.

W. I. CRAIG is superintendent Yampa group of mines, Bingham, Utah.

F. N. COX is superintendent Nogales Copper Co., Minas Prietas, Mex.

H. ZERBE is superintendent Cygnet Co.'s properties, Stockton, Utah.

H. EDWARDS has returned from Dawson, N. W. T., to Salt Lake City.

P. H. CONNELL is manager Lake Superior G. M. & M. Co., Sonora, Mex.

L. R. POUNDSTONE has returned to Graniteville, Cal., from San Francisco.

P. ARGALL has returned to Denver, Colo., from a trip through Old Mexico.

R. A. PARKER is at Las Vegas, N. M., for the winter, much improved in health.

S. W. WEST is resident manager the Dirigo-La Sal M. & M. Co., Basln, Utah.

E. P. JENNINGS has returned from the East to Ryan, Coconino county, Arizona.

J. R. RYAN has been re-elected superintendent Con. Virginia M. Co., Virginia, Nev.

W. A. HALL of San Francisco is examining mining property at Silver City, Nev.

H. R. CHANNING, manager of the Highland Boy, Bingham, Utah, has gone East.

CHAS. BUTTERS has returned from England and is at Virginia, Nevada, this week.

CHARLES SNYDER is manager the Western Ore Purchasing Co., Reno, Nevada.

D. FERGUSON is superintendent International Copper Co.'s properties, La Sals, Utah.

R. C. FACER is manager the Golden Opportunity M. & M. Co., Silver City, Idaho.

J. BAIER, manager Conrey Placer M. Co., Virginia City, Montana, has gone to Boston.

JNO. D. MCGILLIVRAY, of Dawson, N. W. T., is in San Francisco en route to London.

C. BARMORE, manager Elkhart mines, returned to Kingman, Arizona, from Denver, Colo.

H. W. HARDINGE of Denver returned recently from Mexico and is now in New York City.

C. AMONSON, manager Trade Dollar M. Co., has returned from California to Wallace, Idaho.

J. J. PHELAN, manager Sweetwater mines, has left Mono, Cal., for Bridgeport, Conn.

R. C. WILLIAMS is superintendent the South Mountain mining properties, Silver City, Idaho.

G. E. ALEXANDER, who has been visiting southern Kansas, has returned to Denver, Colo.

A. B. FRENZEL, Telluride, Colo., is manager of a company that mines and ships uranium.

F. S. ADAMS has returned to San Francisco from an inspection of Tonopah, Nev., property.

DANA HARMON has returned to San Francisco from a four weeks' sojourn on the Atlantic coast.

W. E. DEITY is at Tubutama, Sonora, Mex., to report copper find made by the Sonora M. & M. Co.

GEO. STARR, superintendent Empire mines, has returned to Grass Valley, Cal., from San Francisco.

W. H. WILEY of Idaho Springs, Colo., is in Mexico reporting on mines for the Montana Copper Co.

ABBOT A. HANKS has recently returned to San Francisco from making an

examination of the magnesite mines of the Martel M. Co., near Livermore, Alameda county, Cal.

W. H. STORMS has returned from an examination of Arizona mining property to Sutter Creek, Cal.

D. H. JACKSON of Tonopah, Nevada, is in San Francisco and contemplates an extended Eastern trip.

J. P. REUTER has resumed superintendence of the Mt. Gorman M. & M. Co.'s operations, Dunton, Colo.

J. H. STRITE, who has been building a mill at the Tomboy, Smuggler, Colo., has returned to Redding, Cal.

M. W. HOYLE of White Oaks, N. M., has been through Montana and Idaho looking at mining properties.

A. E. BARLOW of the Canadian Geological Survey has returned to Ottawa from the Sudbury mining districts.

D. J. CONNERS, formerly of the Copper Queen, is now superintendent of the Golden Era mine, Bisbee, Ariz.

J. E. DAVIDSON has gone to Gold Hill, Oregon, to take charge of the property of the Gold Hill & Bohemia M. Co.

GEO. H. STRONG of Dewey, Strong & Co., the San Francisco patent attorneys, who has been ill, is convalescent.

C. E. JOHNSON of Deadwood assumes the position of chief engineer of the Horseshoe M. Co., South Dakota.

C. DENNIS, formerly of Nevada City, Cal., is superintendent Santa Felicitas G. M. & M. Co., Cabora, Sonora, Mexico.

C. P. WILLIAMS, of Boston, Mass., is at Angels, Cal., looking after his mining interests, his first visit there since 1852.

J. A. PARKER has returned to Oakland, Cal., from an examination of the Ford copper property, Georgetown, Cal.

E. P. PORTER, of the U. S. Geological Survey, and who is collecting statistics as to the output of mines, is at Downieville, Cal.

D. J. SAYER, late superintendent Butterfly-Terrible mine, San Miguel Co., Colo., is examining Baker county, Or., mining property.

GEO. S. BINCKLEY, general manager Esperanza M. Co., Cedros Island, Mexico, returned there this week from San Francisco, Cal.

E. B. VAN OSDEL, metallurgical engineer Spokane, Wash., Smelting & Refining Co., has returned from Baker county, Or.

D. E. BIGELOW of the Union Iron Works, San Francisco, goes to Prescott, Arizona, to build a mill for the Golden Link M. Co.

N. P. WOOD, metallurgist, recently of Tucson, Ariz., and Sonora, Mex., has opened an office at 1757 Champa street, Denver, Colo.

W. HOOPER succeeds J. Hite on the 1st as manager Capital M. & T. Co., Georgetown, Colo., Mr. Hite resigning on account of ill health.

D. J. SAYER has resigned the superintendency of the Butterfly-Terrible M. Co., Telluride, Colo., and has been succeeded by J. McManis.

THEO. POINDEXTER, of the Hercules Gas Engine Co., San Francisco, is touring the Orient, and expects to return, via New Zealand, next June.

W. C. MADGE has resigned his position with the Anaconda Copper M. Co. and goes to Bruce mines, Ontario, as mill superintendent Rock Lake M. Co.

R. AINSWORTH of the firm of Wm. Ainsworth & Sons has returned to Denver from a trip through southwestern Colorado and Salt Lake City, Utah.

JNO. A. MOORE has resigned at the Chamberlain Co., Boulder, Colo., to take the position of metallurgist at the Rambler M. & S. Co., Laramie, Wyoming.

J. M. BALDWIN, of Lead, South Dakota, goes to Ashanti, Africa, accompanied by C. Henley, of Central City; E. S. Smith, of Keystone, and other Black Hills men.

D. W. PARK, assayer of the Merced M. Co., Coulterville, Cal., has resigned to accept a like position with F. Klepetko at the McCune-Haggin property, Peru, S. A.

T. F. NEELEY is now superintendent American Nettle mine, Ouray, Colo., succeeding R. G. Hall, who is at Paradox, Colo., manager of that copper mine and smelter.

W. R. VAN LIEW has resigned at the Washoe smelting plant, Anaconda, Montana, and goes to Globe, Arizona, to assume charge as superintendent of the Old Dominion Copper Co.'s smelting plant.

F. L. SIZER, M. E., has returned to Butte, Montana, after a four months' absence in Chihuahua, Mexico, and reports great mining activity in that portion of the State of Chihuahua where he is operating.

MISS B. M. STEWART and MISS H. M. DILLINGHAM, late managers of the Silver

Mountain M. Co. and the Clear Creek County mill, Empire, Colo., are in California. They are succeeded in the management by F. Bishop.

CURTIS H. LINDLEY returns from San Francisco to the Cour d'Alenes next week to argue the Kellogg, Idaho, Tunnel case, and later goes to Washington, D. C., to appear in the U. S. Supreme Court in the Argonaut-Kennedy case.

J. T. MORROW is appointed superintendent the Boston & Montana smelters, Great Falls, Mont., the position left vacant by the removal of C. W. Goodale to Butte. Mr. Morrow was formerly assistant superintendent. A. E. Wheeler succeeds Mr. Morrow.

E. C. BARNARD, of the Topographical Survey, U. S. G. S., at Needles, Cal., regarding survey of the arid lands on the Arizona and California side of the Colorado river, says that an equal area will be thoroughly investigated on both sides of the river. The topographers will survey down the river 60 miles and map the country on both sides of the Colorado river in equal areas.

F. GUTERMAN is appointed general manager of the Colorado plants of the American Smelting & Refining Co., Carl Eilers, assistant general manager; E. L. Newhouse becomes assistant to the executive committee, with headquarters in New York; J. B. Grant and Dennis Sheedy, members of the executive committee of the company, are to represent the committee in Colorado; A. R. Raht is appointed consulting metallurgist. "The idea," says D. Guggenheim, "is to give the younger men a chance." Manager Guterma will be in charge of eight plants in Colorado—two at Denver, four in Pueblo, one in Leadville and one in Durango.

Obituary.

A. J. PRITCHARD, discoverer of gold in the Cour d'Alenes, Idaho, twenty years ago, died at his log cabin in Murray on the evening of October 3, after a long illness.

DR. A. R. C. SELWYN, C.M.G., L.L.D., F.R.S., for many years director of the Geological Survey of Canada, died at his residence in Vancouver, B. C., on the 25th inst., at the age of seventy-eight years.

JOHN MINEAR, boss timberman at the Iron Mountain mine at Keswick, Cal., died on the 18th inst. from effects of the gas he inhaled during the progress of a fire in the mine. He was fifty years of age, a native of Cornwall, England.

Catalogues Received.

Wisconsin Graphite Co., Pittsburg, Pa., samples of their graphite and mineral paints and descriptions thereof.

The Christensen Engineering Co., Milwaukee, Wis., three handsome booklets: "Christensen Air Brakes," "Electrical Machinery," "Electric Railway Equipment."

Catalogue C of the Triumph pumping engines, made by the S. W. Luitwieler Co., 405-7 N. Main street, Los Angeles, Cal., a detailed account of the Triumph pump and its practical workings, with sectional views, guarantees, testimonials, etc.

The Abbe Engineering Co., standard size 6x9 inches; 46 pages; conveniently arranged compilation of illustrated information on their pulverizers, describing their construction and operation. Issued by the Abbe Engineering Co., 220 Broadway, New York.

Catalogue No. 21 of the W. S. Tyler Co. of Cleveland, Ohio, is an artistic showing of their wire cloth and screens for all purposes, the subject being gone into in a detailed way that is at once interesting and valuable to anyone in any way interested in this important part of mill work. The subjects of wire gauges, mesh, size, weight and length of steel wire; iron and steel wire cloth; price lists of double-crippled wire cloth, brass or copper, etc., are presented in most attractive style, the description being full, and the illustrations of a superb finish that makes them artistic. There are 121 different items in connection with the business that are separately treated of. The handsome book will be sent upon request to any address.

Books Received.

"The Shining Mark and the Mining Shark" is a booklet by F. G. Shaffer, Idaho Springs, Colo., disclosing the devious ways of the deceiver who sells deluded people worthless mining stock. It is an expose of imposition practiced on innocent and ignorant buyers, and if it were in the hands of those tempted to invest their little savings would keep them from fooling their money away.

"Lead Smelting." The construction,

equipment and operation of lead blast furnaces, and observations on the influence of metallic elements on slags and the scientific handling of smoke, finely indexed and in compact shape for reference. Much of it is original, and what is not has been compiled with intelligence. It is written by M. W. Hes, 12mo. viii + 228 pages, illustrated. Cloth, \$2.50 net. Postage 9c. additional. New York, John Wiley & Sons.

Recent Mining Decisions.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

RELOCATION OF MINING CLAIM INURES TO BENEFIT OF ALL COTENANTS.—Where the question was whether \$100 worth of work had been done on a mining claim in the year 1898, and the witnesses of the complainant was to the effect that it had been done, and a witness of the defendant stated that in 1897 the tunnel (the only work done) was in depth 35 or 40 feet, and another witness of the defendant testified that in the fall of 1897 it was 40 or 50 feet, saying that he had measured it the day before and found it to be 89 feet, and further testified that 12 or 14 feet of work was done after December 31, 1898, and defendant's witnesses testified that they estimated the work of the tunnel to cost \$4 to \$5 per foot, such evidence was sufficient to show that over \$100 worth of work had been done in the year 1898. If the required amount of work is done, it is immaterial whether all of the cotenants do their proportionate part of such work. Where it is shown that the required amount of work has been done, it will be presumed, in the absence of evidence to the contrary, that it was done by the cotenants, or some of them. And where one of several cotenants attempts to relocate a mining claim his act inures to the benefit of all the cotenants. The mere lapse of time does not dissolve the relationship of cotenancy.—(Yardwood v. Johnson, Sup. Ct. Wash., 70 Pac. Rep. 123.)

WHEN COMPLAINANT WILL BE ENTITLED TO TRIAL AS TO FRAUDULENT RELOCATION.—A complaint alleged that one of the defendants, who was a cotenant of the complainant in a certain mining claim, had relocated the claim on behalf of another, and that it was not open to relocation, as all the required work had been done on the claim; but that if it had not been done it was owing to the fraud of such defendant, who had for consideration contracted with complainant to do the latter's required work. The prayer was for an accounting, injunctive relief, that complainant be decreed the owner of a certain interest, and for general relief. Defendant urged that the complaint was defective in that the specific cause of action relied on was uncertain. The court held that the contention had no merit, the cause of action being the withholding of the interest; and if the required work had been done the relocation was a cloud on complainant's title, and if not defendant might be found to be a trustee, and such relief as the pleadings and evidence warranted might be given under the prayer for general relief. And it was proper for the lower court not to compel the plaintiff to elect whether he would stand on the allegation that the required amount of work was not done, or that if not it was through the fraud, etc., of the defendant; since more than one set of facts might establish the wrong complained of.—(Yardwood v. Johnson, Sup. Ct., Wash., 70 Pac. Rep., 123.)

FOREMAN MAY BE FELLOW SERVANT.—A coal yard was provided with steel cables, on which, in unloading vessels, buckets holding about a ton were lifted and hauled to the point where the coal was to be dumped, where a device called a "tripper" or "dumper," coming in contact with the latch on the bucket, caused it to empty. The trippers ran on trolley wheels along the cables and were moved to and held in proper place by ropes. When the place of emptying the buckets was changed one or two of the workmen handled the rope, and another, standing by the tripper, told him when it was at the proper place. The foreman, wishing to empty coal into a certain hopper, directed two men to let the tripper down to such hopper, and said he would tell them when it was in the right place, this being commonly done by members of the force doing the general work. They let it down 10 or 15 feet too far, and before it was pulled back a bucket of coal was hauled up on the cable and emptied at such point just as another employe working in the yard in the performance of his duties passed under, and he was injured. There was no defect in the apparatus, and no negligence claimed, other than in placing the tripper in the wrong place. The court held that in assisting in the change in the tripper the foreman acted as a fellow servant of the injured employe, and

that the coal company was not liable for the negligent manner in which such work had been done. (Okonski v. P. & O. Coal Co., Sup. Ct. Wis., 90 N. W. Rep.)

MINING REGULATIONS NOT RETROACTIVE IN CANADA.—The suppliant by right of discovery under the Dominion Lands Act and the Dominion mining regulations of 1889, may thereafter patent a grant of a certain gold mining claim in the Yukon district in December, 1896. His grant, among other things, gave him, for a term of one year from its date, the exclusive right to all proceeds realized therefrom; and the rights which it conferred upon him were, it was declared, those laid down in the Dominion mining regulations, and no more, and were subject to all the provisions thereof, whether the same were expressed in the grant or not. During the currency of the original grant an order in council was passed making grants of gold mining claims in the district subject to a royalty. Afterwards, namely, on Dec. 7, 1897, the suppliant's grant was renewed, on the same terms as those expressed in the original grant. It was held that the terms of the renewal should be construed by reference to their meaning in the original.

RIGHTS OF COTENANTS UNDER CANADIAN MINERAL LAW.—The sheriff in possession of a free mining claim has no power to take out a special free miner's certificate, under Section 4 of the Canadian Mineral Act as amended by the Act of 1889, in favor of a judgment debtor; neither has the sheriff power to renew a certificate before lapse. Where one or more of the cotenants of a mining claim allow their certificate to lapse their interest at once vests, pro rata, in their former cotenants. (McNaught v. Van Norman, Sup. Ct. Brit. Col., 9 B. C., R., 131.)

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING OCTOBER 21, 1902.

711,612.—FRUIT DIPPER—W. K. Allen, Newberg, Or.
711,552.—FLOATING DOCK—J. E. Blackwell, Seattle, Wash.
711,830.—FLOATING FISH TRAP—A. C. Burdick, Portland, Or.
711,554.—ASSAYERS' FURNACE—A. C. Calkins, Los Angeles, Cal.
711,822.—NUT LOCK—F. Cavallaro, San Jose, Cal.
711,845.—SINK—Fountain & Myers, Oxnard, Cal.
711,892.—FLOW—V. T. Gilchrist, Benicia, Cal.
711,659.—NECKTIE HOLDER—Graham & Goddard, Oakesdale, Wash.
711,850.—AWNING—C. S. Hamilton, Salem, Or.
711,903.—CONCENTRATOR—L. Look, Los Angeles, Cal.
711,904.—COKE APPARATUS—T. S. C. Lowe, Pasadena, Cal.
711,905.—COKE APPARATUS—T. S. C. Lowe, Pasadena, Cal.
711,573.—MEAT NEEDLE—T. H. Means, Waitsburg, Or.
711,579.—HAMMOCK SUPPORT—W. H. Morehouse, Wasco, Or.
711,732.—LIFTING JACK—C. Mykolashuk, South Bend, Wash.
711,587.—ICE VEHICLE—F. H. Ober, Seattle, Wash.
711,884.—PROPELLER—V. Sjostrom, Los Angeles, Cal.
711,802.—FOLDING SATCHEL—J. Trevelthan, Berkeley, Cal.
711,804.—PUMP—Webster, Hall & Stadler, Bakerfield, Cal.
711,602.—COW'S TAIL HOLDER—F. S. Weed, Thorp, Wash.
711,650.—ORE GRADER—F. W. Wood, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LAND GAUGE ATTACHMENT FOR PLOWS.—No. 711,892. Oct. 21, 1902. V. T. Gilchrist, Benicia, Cal. Assigned to Baker & Hamilton of San Francisco, Cal., a corporation. This invention relates particularly to that class of plows known as "disk" plows, and has for its object to provide a simple means of changing the line of the furrow wheels in relation to the draft and of raising and lowering the frame in order to regulate the width and depth of cut of the plows. It consists of a land gauge attachment for plows comprising in combination a tongue pivoted to the plow frame, a vertical axle adjustably supported on said tongue and movable therewith, a sleeve casting turnable about said axle, a non-rotatable wheel standard slidable in said casting, lever mechanism by which said casting is turned on its axis, a segmental rack pivoted on said casting, a lever fulcrumed on said rack, connections between said lever and the wheel standard whereby the sleeve is raised or lowered, and accordingly the plow frame, to vary the depth of cut of the plow, and an adjustable pivotal connection between the plow frame and said rack.

NUT LOCK.—No. 711,823. Oct. 21, 1902. F. Cavallaro, San Jose, Cal. This invention relates to a nut locking device which is especially designed for securing fish-plates by which the meeting ends of railway rails are united in such a manner as to prevent the nuts starting off by the pulsations of passing trains, and thus loosening the connection, while at the same time the device has sufficient play to allow the expansion and contraction. It consists in the combination in a nut lock of plates having bolt holes made therethrough and adapted to clamp the parts to be secured, corrugations formed radially about the bolt holes, bolts passing through said holes having heads upon one end,

said bolts having lugs formed beneath the heads and to engage the bolt holes to limit the turning of the bolt, and screw threads upon the opposite ends, nuts fitting said screw threads having the inner ends corrugated and washers interposed between the nuts and the plates, said washers having one surface corrugated to engage the nut corrugations, and an extension upon one side of the washer.

Latest Market Reports.

SAN FRANCISCO, Oct. 31, 1902.

METALS.

SILVER.—Per oz., Troy: London, 23½d (standard ounce, 925 fine); New York, bar silver, 50½c, refined (1000 fine); San Francisco, 50½c; Mexican dollars, 40c San Francisco, 39½c New York.

The exports of silver from the United States for the nine months ended September 30, 1902, decreased \$5,907,390; imports during the same period decreased \$3,789,067; net decrease in exports, \$2,118,323.

COPPER.—New York: Standard, \$11.00@11.25; Lake, 1 to 3 casks, \$11.95; carload lots, \$11.75; Electrolytic, 1 to 3 casks, \$11.75; carload lots, \$11.60; Casting, 1 to 3 casks, \$11.75; carload lots, \$11.60. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £52 1s 3d spot per ton.

C. M. Palmer of the Butte & Boston Copper Co. says: "I do not share in the belief that at 11 and 12 cents a pound copper can not be mined at a profit. With higher prices, it is apparent from past experience that the volume of consumption will be materially reduced, and this at a time when new properties are continually being opened and developed, is bound to result in such an overproduction as will be disastrous. With the price of copper at the first-named figure, I am confident there will be a market for all that can be mined. Copper consumers do not take readily to the substitution of other metals except in times when they think the ruling price is excessive. Indications point to a large advance in the volume of production within the next ten years. At the present time the Lake Superior district is but touched. That is a belt extending 150 miles or more that will some day be one continuous copper-producing section. Considerable work is also being done in Arizona. Mining experts believe that the Treadwell mines will develop into large copper producers. The copper mines of Mexico are also attracting the attention of investors, and development work and exploration are being pushed by companies holding concessions. The great ore bodies of Alaska are still untouched. It is known that there is copper all along the coast, but it is not as yet demonstrated how far down operations need to be extended to get at the best of the copper deposits.

"In my opinion, copper can be mined at a net cost of 9 cents a pound, and a ruling price of 11½ cents gives a better margin of profit than is to be obtained in the average commercial enterprise. Since I first came to Butte, and since the first organization of the Butte & Boston Co., the processes of smelting and reduction have been marvelously transformed. It is but reasonable to suppose that new and improved methods will be found to possess merit. The consumers of copper are familiar with the cost of mining and will resent vigorously any attempt to make them pay more than a fair price over and above the cost of production. This resentment will take the form of using other metals, although it has been found that copper is preferred at the right price. From what I have been able to learn, there is small danger of aluminum being used as a substitute to any considerable extent."

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots, 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 15s per ton.

SPELTER.—New York, \$5.45; St. Louis, \$4.50; London, £19 5s 0d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$27.00; San Francisco, ton lots, 28c; 1000 lbs., 28c; 500 lbs., 28c; 200 lbs., 28½c; less, 29c; bar tin, \$3.32c. London, £120 12s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$45.50 per flask of 70½ lbs.; Denver, \$49.25. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots,

18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

NICKEL.—New York, 50@60c per lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$22.75; gray forge, \$20.50; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$29 and \$30.00; open hearth billets, \$32 and \$33.00; San Francisco, bar, 7c to 12c per lb. CHICAGO CURRENT QUOTATIONS.

No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$5.50; 5x, \$6; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c per set; 14oz., 40s., 9½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.50; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 27@28c per lb.; carloads, 25@26c; in 10-lb. tins, 38c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 24@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3½@3¾c; California refined, 2@2½c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.25 @1.50 per 100 lbs.; sks., \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c per lb.

OILS.—Linseed, boiled, bbl., 57c; cs., 62c; raw, bbl., 55c; cs., 60c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 53c. Kerosene—Pearl, per gal., 20c; Astral, 20c; Star, 20c; Extra Star, 24c; Eocene, 25c; Elaine, 22c; Water White, in bulk, 13½c; Mineral

Seal, iron bbls, 19c; wooden bbls., 22½c; cs., 25c; Mineral Sperma, cs, 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., 95c; cs., \$1.00; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 55@57½c; cs., 57½@60c; Sperma, crude, 55c; Natural White, 66c; Bleached do, 70c; Whale Oil, cs, 55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—in bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c per lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, ½ lb., 60c.

MANGANESE.—(90% and over) ½ lb., \$1.25.

MERCURY.—Bichloride, ½ lb., 90c.

MOLYBDENUM.—25c. ½ gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) ½ lb., 80c.

SILVER.—Chloride, ½ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ½ lb., \$1.00.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c.

ZINC.—Dust, ½ lb., 10c.

ZINC.—Sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

ASSESSMENT NOTICES.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of September, 1902, an assessment (No. 14) of two (2) cents per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 112 Main street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 1st day of November, 1902, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 24th day of November, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

Office—112 Main street, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of September, 1902, an assessment (No. 22) of two cents per share was levied upon the capital stock of this corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 1st day of November, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 24th day of November, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors.

Office—415 Front street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by hydraulic process from J. E. Jones, in Jones' mine, near Bullards Bar, Yuba County, Cal., drainage into Oregon Creek which reaches Yuba River; and from J. F. Cowdery, in Browns Flat Mine, near St. Louis, Sierra County, Cal., drainage into Slate Creek which reaches Yuba River; gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., Nov. 3, 1902, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by hydraulic process from Prosper LeComte, John Craig and Joseph Depot, in Barton Hill Placer Mine, near Strawberry Valley, Yuba County, Cal., drainage into Lost Creek which reaches Feather River; from Beattie Mining Co., in Beattie Mine, near Georgetown, El Dorado County, Cal., drainage into Canon Creek which reaches American River; and from Big Butte Gold Mining Co., in Big Butte Gold Mine, near Berdaos, Butte County, Cal., drainage into Butte Creek which reaches Sacramento River, gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., Nov. 17, 1902, at 1:30 P. M.

SITUATIONS WANTED.

CYANIDE CHEMIST, AMALGAMATOR AND ASSAYER wants position. School of Mines graduates. References extending over 10 years. Address "Chemist," ears of Mining and Scientific Press.

Wanted, position, preferably in charge of operations at gold mine. Graduate of one of the best Eastern technical schools. In mining course; several years' active experience in California mine, including both underground and mill work. Can give list of references as to character and ability. Address C. H. W., care Mining and Scientific Press.

Open for engagement after Jan. 1, as manager or asst. manager. Now manager for American Mining Co. in Mexico. Technical mining education and years of actual experience. References and bond furnished. Address "Ocampo Durango," this office.

WANTED.—Graduate Engineer of the College of Mining, University of California, with four years' practical experience, desires position as assistant to the general manager or superintendent of reliable mining company; location immaterial, but Mexico preferred. At references as to character and ability. Address "Engineer," Mining and Scientific Press, San Francisco.

Mining Engineer wants position as superintendent. Practical miner, millman, cyanider and assayer. Experience extending over twelve years. Graduates School of Mines. Address A. R. S. M., this office.

COMPETENT SUPERINTENDENT wants position in California; 15 years' experience in running mines, mills and smelters for profit, and managing men. College bred and technically educated. Formerly held positions as assayer, mining engineer, accountant, superintendent, and manager. Member A. I. M. E. High testimonials. Address "Superintendent," Box 813, Seattle, Wash.

A young man, 30 technical graduate, with several years' experience in this country and in Spanish America, last in charge of a cyanide plant in Mexico, desires position. Assistant superintendent or surveyor whers careful, conscientious work would be appreciated is preferred, though an offer to take charge of a cyanide plant would be considered. References. Address A. B. C., this office.

Experienced mining man wishes to meet capitalists who desire his services in looking up mines and prospects of smelt, with a view to bonding or purchasing the same. Is thoroughly acquainted with the important mining districts of Mexico, where he at present knows of propositions very worthy of consideration. Would be willing to open up and develop a property. Address C. F. L., this office.

WANTED.

WANTED.—A man thoroughly familiar with the reduction of quicksilver ores, to take entire charge of mines and furnaces. Address, giving references, "Quicksilver," care of Mining and Scientific Press, 33½ Market St., San Francisco, Cal.

WANTED.

A First-Class Mechanical Draughtsman Thoroughly Familiar with Mining Machinery. First-class position. Address Box 29, this office.

WANTED.—A Gold Property or Dredging Land.

Gives location, description, prices, etc. Address Box 12, this office.

FOR SALE.

Button Balance for Sale CHEAP.

John Taylor & Co. \$100 Balance. Guaranteed as good as new. NO REASONABLE OFFER REFUSED. Address Sordee, this office.

A GOLD MINE FOR SALE.

Over \$100,000 worth of ore in sight. Water power, machinery and 20-stamp mill on the premises. Address M. Z. F., this office.

BARGAIN—Two 6-Foot Belt, Union Concentrators.

Used two months. LEGG & SHAW, Nevada City, Cal.

The Mines Exchange, Ltd.

MINES and MINING STOCKS.

Address nearest office for reports or quotations.

Our New and Revised Catalogue of Practical and Scientific Books, 92 pages, 8vo.; a Catalogue of Books on Metallurgy, Mining, Prospecting, Mineralogy, Geology, Assaying, Analysis, etc.; a Catalogue of Books on Steam and the Steam Engine, Machinery, etc.; a Catalogue of Books on Sanitary Science, Gas Fitting, Plumbing, etc., and our other Catalogues and Circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

An Encyclopedia of Useful Technical Knowledge. A Great Labor, Time, and Money Saver for Practical Men.

Prices \$2.00.

Free of Postage to Any Address in the World.

THE
ENGLISH AND AMERICAN MECHANIC.
AN EVERY-DAY HAND-BOOK FOR THE WORK-SHOP AND THE FACTORY.

Containing several thousand Receipts, Rules, and Tables indispensable to the Mechanic, the Artisan and the Manufacturer. By B. Frank Van Olse. A New, Revised, Enlarged and Improved Edition. Edited by Emory Edwards, M. E., Author of "Edwards' 900 Examination Questions and Answers for Engineers and Firemen." Illustrated by 85 engravings. One volume, 500 pages, 12mo., closely printed; the matter covers an extremely wide range of useful technical information for all classes of mechanics and other practical men.

A Circular of 24 pages, showing the full Table of Contents of this valuable book, will be sent free and free of postage to any one in any part of the world who will furnish us with his address.

Thallner's Tool-Steel.

Indispensable to All Tool Makers and Tool Users.

JUST READY.

Tool-Steel: A Concise Hand-book on Tool-Steel in General; its Treatment in the Operations of Forging, Annealing, Hardening, Tempering, etc., and the Appliances therefor. By Otto Thallner, Headmaster and Master in Chief of the Tool-Steel Works, Bismarckhütte on the Saale, Germany. Authorized Translation from the German by William T. Brant. Illustrated by 69 engravings. 196 pages, 8vo.

Price \$2.00, free of postage to any address in the world.

CONTENTS.—Introduction. I. Composition of Tool-Steel and its Classification according to it. II. Classification of Tool-Steel according to the Degree of Hardness and the Purpose for which it is to be Used. III. Observations on the External Appearance of Commercial Tool-Steel. IV. Observations on the Fractures of Steel, with regard to the Structure in the Hardened and Non-Hardened States. V. Practice of the Fire-Treatment of Steel. VI. Appliances for Annealing Steel. VII. Appliances for Hardening Steel. VIII. Hardening of Tool-Steel in General. IX. Hardening of Tools which are to be Hardened in Their Entirety. X. Hardening of Tools which are only to be Partially Hardened. XI. Cooling of Tools in Hardening and Devices for this Purpose. XII. Liquids Used in Quenching Steel. XIII. Tempering of Hardened Steel, and Devices for this Purpose. XIV. Straightening Tools. XV. Case-Hardening and Preventions against Surface Decarburization and Overheating. XVI. Welding of Steel. XVII. Regeneration of Steel which has been Spoiled in Fire. XVIII. Investigations of Defects of Hardened Tools. XIX. Improving the Properties of Strength of Steel. Appendix. Index.

The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.

An Illustrated Circular of 3 pages, quarto, giving the full Table of Contents of this important book, will be sent free of postage to any one in any part of the world who will furnish his address.

We Will Send SAMPLES of Perforated Metal Screens.

Suppose you ask us for samples of such screens as you prefer. We make all kinds—Round Hole, Plain, Diagonal and Horizontal Slot. Indented Slot both Horizontal and Diagonal. We can make our closest quotations on specification of kind and number of sheets required. We also punch Tinned Screens. Get our circular No. 4. If you want to try a set of our screens we will make them for you at a special trial price. We know they are good, and we want every man who has a battery of stamps to have the same knowledge. We are bidding for your permanent patronage and will maintain the quality of our screens with the utmost care.

ANACONDA SELF-OILING AXLES,

in point of smooth running, durability and economical use of oil, are "far and away" superior to any wheel equipment on the market. We have stock at Denver, Salt Lake City and San Francisco ready for prompt shipment.

AT SAN FRANCISCO (RIX WAREHOUSE).

Spiral Riveted Pipe.

While we make slip joint and ordinary flanged and riveted joint pipe, we recommend as the best that can be used our **BOLTED JOINT**, shown in the accompanying cut. We will be glad to explain its advantages and to make you a low bid to supply your entire pipe line fitted with these bolted joints.

SPRING STOP COCKS.

We have a long list of customers who are well pleased with our AMEW spring cocks for compressed air lines. They stop the loss of power (often a serious one) by leakage where common cocks are used. Many other mines might use these at a saving. Is yours one of them? We would be glad to have you arrange to try them.

We make sizes $\frac{3}{4}$ ", 1", $1\frac{1}{4}$ ", $1\frac{1}{2}$ " and 2".

UTAH AGENTS: UTAH MINING MACHINERY & SUPPLY CO., SALT LAKE CITY.
CALIFORNIA AGENTS: RIX COMPRESSED AIR & DRILL CO., SAN FRANCISCO.

GENERAL ELECTRIC COMPANY'S Electrical Mining Apparatus

Does away with long steam piping, and of leaking compressed air joints. It saves the miner from the high temperatures due to steam piping, it preserves the mine timbers through the absence of moisture, and costs far less for repairs and renewals than any other system of mine operation.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Construction Trains Hauling Rock From Little Round Mt. for the Great Dyke Across the Lake; Steam Shovel at Work on the Cut-off at Foot of Little Round Mountain, Camp Harney; M. Harney Superintending Construction Work in Lake Between East Shore and Promontory; Building the Road Across the Lake, Midway Between East Shore and Promontory; Constructing Track for Rock Train by Means of Sand Piers on Which Heavy Stringers and Track Are Laid; West End of Construction Work Between East Shore and Promontory, Aug. 30, 1902, 262. The Trestle Bridge Being Built Across Salt Lake by Which the S. P. R. R. Will Save 42½ Miles Distance, 266. N. W. S. & R. Co.'s Plant, Looking South; N. W. S. & R. Co.'s Plant, Front View; N. W. S. & R. Co.'s Plant, From the Sea, Crofton, Vancouver's Island, B. C., 270. Mining and Metallurgical Patents, 271.

EDITORIAL.—Colorado at the St. Louis Exposition; The Lead Merger; The Control of the Silver Market; The Proposed Blue Mountain Forest Reserve; "Financial and Physical Condition" of Utah Mines; "Wildcat" Mine Investments; "Questions and Answers;" Cripple Creek, Colo., Combine; Mining Congress at South Dakota, 263.

MINING SUMMARY.—272-273-274-275.

LATEST MARKET REPORTS.—17.

MISCELLANEOUS.—Concentrates, 264. Some Further Questions and Answers, 265. Ogden and Lucin Railroad Cut-Off, 266. Notes on Sump Solution, Extractor-Box Work and Cleaning Up in the Cyanide Process, 267. Width of Sluice Plates; Value of Fuel Oil; The Finer Issue of Mining, 268. Mine Valuation by Mining Experts; Electric Power in Rhodesian Mines; Electric Three-Phase Plant for Pumping; Laoustrine Deposit of Gold, 269. Smelting on Vancouver Island, B. C.; Death From 110 Volts, Alternating, 270. Two Suggestions; Mining and Metallurgical Patents, 271. Personal; Commercial Paragraphs; Catalogues Received, 275. New Patents, 17.

COLORADO will have a space 200 feet square in the mineral exhibit building at the St. Louis Exposition, and will doubtless derive great benefit from the acre of space properly utilized. That event will afford excellent opportunity for good advertising of mineral resources, and every prominent mining commonwealth should see to it that good space is secured and good use made of it. This is an age of advertising, and the State or section that neglects its legitimate opportunities falls behind in development.

THE lead merger is the latest in mine product monopolies. The details of the combine are now being worked out; the policy is of course the same general one that controls and guides similar aggregations, it being doubtless the plan of the lead companies' consolidation to put into practice full recognition of the fact that even absolute control of production gives no power to advance prices except by restricting the supply. Arbitrary prices diminish consumption, and where profit depends upon the elasticity of the demand, the surest way to maintain a profitable sale figure is to check increase in the quantity available. All the big "trusts" have learned this lesson, and as the new merger is a child of experienced parents, it will doubtless be an apt pupil.

ON page 265, among an overflow from "Concentrates" page, are some questions and answers. As is customary with this paper many of the questions (as on pages 228 and 229 of the issue of Oct. 18) are answered by experts on those subjects, to whom the questions are submitted with courteous request for reply. The matter is here noted in reference to the question from Cedar, Arizona, relative to drilling. The practical miner to whom this particular question was referred was Mr. Henry W. Stow, manager Gold Bank mine, of Forrestown, Butte county, Cal., and his answer is printed verbatim to illustrate a point to which editorial attention has been more than once directed, viz: that very often it is not possible or practical to give some of the questions received any more than the most general answer, as the inquiry is not in detail, nor specific. In his answer Mr. Stow very aptly points this out, and asks a few questions himself, illustrative of what might be brought out concerning that subject. The matter is not referred to for any other reason than to say that clearness of thought is necessarily precedent to clearness of utterance, and in all technical work it is

absolutely essential to accuracy and thoroughness that there be a precision and detail to every bit of work, even to the asking of a question about it, especially if it be expected that such question have appropriate answer of individual value.

GRADUALLY and naturally the control of the silver market is passing from London to New York and San Francisco. The silver shipments which have long been made from San Francisco to China now extend to India, which is an inevitable business result of American domination in the Philippines and consequent direct trade influence in the Orient. The establishment of a Manila branch of the U. S. mint and U. S. banking facilities there should tend to check the freight rate system so long in continuance that made steamship charges on silver, via English ports, thirty-five days, more than direct from San Francisco, twenty days. Through shipments are now made from New York to Bombay. As to Chinese silver much of it has all along passed through Hamburg, a roundabout system, manifestly more costly and cumbersome than from San Francisco to Shanghai, via Manila. Speed and directness, with minimum freight charges, characterize all modern business, and must obtain in the placing of silver in its best market—the Orient.

UTAH mining men are discussing the advisability of presenting a bill at the coming session of the Utah State Legislature making it mandatory on all mining companies in the State to periodically issue a statement of their "financial and physical condition." The idea of such a law is an excellent one: its observance and practical working in other localities has not been wholly satisfactory. A legal measure of that nature would have to be rigidly and impartially enforced, and in that event the law would be of undoubted public benefit. The question is almost entirely one of public policy: to protect probable investors against frauds and fakirs, who find their finest fields in the lack of publicity that affords opportunity to work off worthless mining schemes on investors to the ultimate injury of the commonwealth. But a lax or corrupt administration of the law would make matters even worse than at present. Utah's skirts are clean in that regard in comparison with some other mining States, and if such a law is put on her statute books there should be as little opportunity for "graft" as possible, and sufficient continuity of public opinion to insure impartial observance.

EASTERN OREGON MINERS are remonstrating against the proposed Blue Mountain forest reserve. They take the stand that it is unnecessary; that it curtails the mineral area and subjects the prospector and miner, particularly the former, to espionage. The government officials say they have given the matter careful consideration and after extended examination they find that the limited supply of timber demands that some steps be taken to prevent the utter destruction of the forests and consequent heavy loss to ranch owners and miners on account of the scarcity of lumber that would follow reckless destruction of the forests. It is understood that the opposition does not concede the entire truth of the official statement. That there is rapid destruction of the country's forest area is manifest, and that every just effort should be made to conserve the timber goes without saying. It is for the public interest, the common good, that requisite reservation and protection should be made and maintained. In this all are concerned, and while, by reason of the facts, the prospector and miner are entitled to more than ordinary consideration, yet impartial administration of the proposed segregation of certain timber areas must work to the ultimate advantage of all residents of that region.

AN Eastern contemporary makes an excellent showing of the folly of "wildcat" mine investment, but, possibly, goes too far in general denunciation of the primary stage of a mine proposition, big or little. Just where the line shall be drawn, or just what should justly be termed a "wildcat" is at times difficult, and where there is no clearly manifest tendency to fraud or sharp practice, it is sometimes safe to give the property the benefit of the doubt. It is very easy to call a new or unproductive mining property a "wildcat," on the assumption that it can never be anything else but a sink for foolish invest-

ment; but it is not so easy to fairly or justly draw the line between what may appear to-day to be the wildest of wildcats or to-morrow so good a thing that the owners feel sorry for the outsiders who own none of it. Of course, it may be said: "This is only haggling the question. Everyone knows what a 'wildcat' is." But do they? The history of many great dividend payers shows differently. The Comstock, Cripple Creek, the Homestake, Tonopah and a dozen others furnish examples of how mistaken smart men may be as to the probabilities of a district. It were not well to be too hasty to dub a mining property a "wildcat" unless its owners or manipulators exhibit "wildcat" tendencies. These "wildcat" attributes lie more largely with men than with mines.

AMONG unions and trusts of various kinds the combine of the Cripple Creek, Colo., leasers is worthy of notice. It is reported that the organization provides that none of its members shall pay to mine owners a higher scale of royalty than 25%. There are some conditions that would appear to justify the attitude of the Cripple Creek leasers in refusing to pay a higher royalty. Indeed it should not be necessary—that is, such an organization should have no just reason for existence, as it is manifestly to the interest of the mine owner not to attempt too hard a bargain with the would-be leaser. Sometimes a mine owner gives a working bond to a prospective purchaser, the regular agreement being made that the development, etc., shall be done as it ought to be, but experience of that kind is often very unsatisfactory, as not seldom when the bond leaves, the last state of that mine is worse than the first. Not so with the leaser; he is usually a miner and works the ground miner-fashion. But if he has to pay 30% royalty on \$25 ore, he can not do the dead work and exploitation that properly go with ship-shape handling of a mining property. He has to gouge and gopher to make expenses and the result is had for both parties. However, the whole thing is simply a case of supply and demand. If there are three leasers competing for one bit of ground the owner can get whatever royalty he asks; if the reverse, then the paraphrase of "two men for one job" applies. So long as the present risk demand for leasing ground exists in Cripple Creek, it is probable that the principle embodied in "the leasers' combine" will be more of a silent precept than an active duty.

THE American Mining Congress, through its secretary at Carlisle, Penn., solicits aid and advice that the next session at Lead and Deadwood, South Dakota, may be an assured success. Among the suggestions of the secretary are the presentation to Congress of the opposition to the proposition abolishing apex and extralateral rights. Any organization that makes continuous opposition to that measure cannot be considered as thoroughly representative of the best interests of the mining industry. It is not to be wondered at that the recent "Mining Congress" in Butte voted down a proposition to do away with "the law of the apex" without discussion. Such a thing didn't need discussion—there. Montana is a marvel for mining statistics and money manipulation, and "the law of the apex" has considerable local significance, more particularly with Mr. F. A. Heinze, who ten years ago first found how splendidly "the law of the apex" could be worked. While mining engineer for the Boston & Montana Co. he is credited with having found certain unclaimed spaces between the surface lines of sundry valuable copper producing properties, got possession, announced infringement, secured injunctions, all done in accordance with law—"the law of the apex." Nor is Mr. Heinze to be arraigned therefor. All he has done has been done in strict compliance with the letter of the law. The wrong lies in the silly statute that permits such perversion of natural law. Meanwhile Secretary Mahon of the American Mining Congress appeals for aid to properly present the "protest" of the last convention of the Congress at Butte to the coming Congress at Washington. Due regard for the eternal fitness of things might impel Mr. Heinze, as a chief beneficiary, to make handsome contribution to the fund so solicited. "The law of the apex" has made millions for him: it were but doing the handsome thing for him then to aid in deferring or defeating its repeal.

Concentrates.

UNDER ordinary conditions water can hold in solution about 25% of salt.

IN a mine employing 350 men the cost of candles would be about \$3 per month per man.

THE largest surface pipe line in the world starts at Coolgardie, Australia—328 miles.

A COPPER TUBE of ordinary thickness and 1 inch internal diameter should stand heat up to 706° F.

NO ONE can "define electricity." There is a scientific theory that it is a disturbance of the ether of space.

AN aneroid barometer and a holstetric barometer are the same thing. The difference is only in the names.

AT a speed of 12 miles per hour a 1½-inch diameter steel cable should be theoretically capable of transmitting about 2000 H. P.

THE volumetric efficiency of an air compressor is the proportion of the amount of air actually delivered into the pipe line to the theoretical piston displacement of the compressor.

IT is not uncommon to use a steam shovel in tunnel work. An instance is the Aspen tunnel on the Union Pacific Railway in Wyoming last year, where a steam shovel did notable work.

NO IRON or steel ship has ever been built in Canada, the plates, angles, beams, etc., of which were made in Canada, not having the facilities to convert the raw material into completed ships.

URANIUM ORE is bought by P. Spier, 1 Ernstrasse, Breslau, Silesia, and J. E. Deorient, Zwickau, Saxony, Germany. So far as "Concentrates" knows there are no direct American buyers of uranium ore.

AN INK which can be used with a drawing pen on zinc and which is acid proof, is made of one drachm verdigris, one drachm sal-ammonia powder and one-half drachm lamp black, mixed with ten drachms water.

WITHERITE (carbonate of barium) is worth about \$25 to \$30 per ton delivered in New York, in the lump. Powdered it is worth about 2 cents per pound. Barium oxide is a manufactured article at Niagara Falls, N. Y.

A WOMAN married or single, or a male minor can locate and hold a mining claim. A placer location can be any shape, but must conform as nearly as practicable with the U. S. system of public surveys and the subdivisions of such surveys.

WHIN is the Scotch name for quartzite. Quartzite is merely a sandstone in which the crystals have disappeared by becoming indurated. Sometimes when the original sand beach contains gold the quartzite will carry a little gold.

PNEUMATIC DRILLS range in weight from fourteen to thirty-five pounds, and drill from ¼ to 2 inches with from 3 to 4 inches feed, and require pressures from 80 to 100 pounds, with a consumption from 20 to 45 cubic feet of free air per minute.

LEAD is treated by the electrolytic process at Niagara Falls, N. Y., 1000 pounds spongy lead yielding 108 pounds litharge, 110 pounds red lead, 116 pounds lead peroxide, or 125 pounds white lead. Sulphuric acid is produced as a by-product, about 800 pounds to each ton of lead.

IMPULSE WATER WHEELS large enough to develop 3700 H. P. each, using water under a head of 1600 feet, have been built in San Francisco. Two of that size were furnished an electric power company to be direct-connected to a 2000 K. W. alternator, mounted on nickel steel shafts.

AT Manton, near Red Bluff, Cal., water power is applied direct to a circular saw in the sawmill of Forward Bros. Two 20-inch water wheels under a fall of 120 feet are attached to the end of a 20-foot steel shaft 4½ inches in diameter. The 60-inch saw is at the other end of the shaft and works satisfactorily.

DIRTY MERCURY can be cleaned by digesting it with dilute nitric acid for twenty-four hours, taking one part acid to three of water. In retorting foul quicksilver to purify it, the retort should be half filled, the quicksilver covered with a layer of quicklime or powdered charcoal, the heating then done very gradually, the retort not being brought to a full red heat.

WOOD may be used with success as fuel for a reverberatory furnace. At San Fernando, Mexico, it has been so used with marked success, the furnaces being 9x16 feet; grate area, 16½ square feet; depth from bridge to grate, 3 feet. With four Mexican cords—equal to 7.7 American cords—fifteen tons of calcined concentrates and siliceous ores were daily smelted, making a slag of about 40% SiO₂.

WHERE a good priming pump is installed with tight piping and a vacuum of 27 to 28 inches is liable to be formed, it is safer to have the priming pipe carried up more than 30 feet above the water level, as there will be some surging of water in the pipe. Thus some water might get over into the horizontal pipe and from there into the primer, and a very small quantity of sand or grit will impair the efficiency of the latter.

WHEN an ore deposit occurs in a massive rock like granite, porphyry of any kind, feldsite, andesite, etc., and there is found an extensive crushing of the country rock along and including the vein, crosscuts are of utmost importance, for the best defined wall often proves to be merely a plane of fracture within the mineralized

zone, beyond which pay ore may be again found; and because a crosscut in one portion of the mine is without result, should not deter the management from making others elsewhere.

THERE are three standpoints from which the relation of a geological survey to the mining industry of the country may be viewed: The purely scientific or geological point, the technical point and the commercial point. As from the nature of things the third point often demands only the consideration of a very small portion of a particular district, it is not to be the business of the Government to consider such a view point.

CONCENTRATION of cinnabar ore is not considered profitable or economical. Usually it would cost more than direct treatment of the ore as it comes from the mine. If there were a very large body of low-grade ore capable of being quarried and treated by free water power in a place where fuel was expensive, concentration might be admirable, but ordinarily it is not thought that in the case of cinnabar ore it would be of any benefit.

THE MINING AND SCIENTIFIC PRESS is always glad to receive and publish communications of interest to miners and metallurgists and industrial workers. Interchange of opinion and experience is of general value to the mining industry, and mining men everywhere are invited to consider the columns of the paper an open forum for discussion and information upon topics of practical value. Photos for illustration often enhance the value of such suggested articles.

TO ASSAY a quicksilver ore containing arsenic, the ore may be mixed with 4½ times its weight of litharge; heating this in a retort produces a flowing, slag-like mass, formed by the litharge, sulphuretted of arsenic, etc., the cinnabar being decomposed into sulphurous acid and metallic mercury. The quicksilver is completely volatilized by a moderate heat and collects in the condensing apparatus and the farther portion of the neck of the retort. A precaution necessary during the operation is to gradually and moderately heat the clay or glass retort, to prevent its being perforated by the effects of the litharge before the process is finished.

EVERYTHING in the reading columns of this paper is intended to so appear solely for its value to the reader. The subscriber is foremost, and what is of interest to him is what is always desired. If any article or item happens to advertise any one making the device or apparatus mentioned, so much the better for him, but such notice is incidental. The paper is in its forty-third year, and has never yet taken a dollar to put anything in its reading columns—or to keep anything out. The fact that a published description of some work may prove an advertisement for whoever made the machinery is no reason why it should appear, but certainly is no reason why it should not if the matter is of sufficient interest to readers to warrant its appearance.

A CATALYTIC AGENT is a material which affects the velocity of a chemical reaction without itself appearing in the final product. A catalytic substance is incapable of starting a reaction; it can only affect the rate of change. The number and variety of reactions susceptible to catalytic influence are almost infinite. There appears to be no kind of chemical reaction which cannot be influenced catalytically, and no form of chemical substance, be it elemental or compound, which cannot act as a catalyst. The catalytic agent may be a gas or a vapor, a liquid or a solid. The reactions effected may be of simple combination or dissociation; reduction; oxidation, which may be partial, complete or fractional; hydrolysis; substitution, etc., together with combinations of these.

A POCKET in quartz is gold concentrated in a quartz ledge, occupying a few inches or a few feet lengthwise of the ledge, and the shoot may run down lengthwise many feet. Beyond a few inches or a few feet lengthwise of the ledge the rest of the ledge may not contain a color of gold, or it may pocket in other places, as it often does. Pockets are generally found near the top of the bedrock, though many have been found 50 or 100 feet, and even deeper. A pocket may contain a few dollars or many thousands, this being generally governed by the size of the ledge and the amount of iron in and around the ledge, caused by an iron stringer striking the ledge where the pocket is found. Without the presence of iron there can not be a pocket, though iron in a quartz ledge is no evidence of a pocket of gold. Pockets may occur in any formation—slate, granite, serpentine, porphyry, etc.—but not where the upper or hanging and lower or foot wall of the ledge are of the same formation. There must be contact to make a pocket.

THE constant of a riveted, uncoated metallic flume is 142.42, of an ordinary wooden flume 76.7; then, $142.42 \div 76.7 = 1.844$; velocity or discharge for such wooden flume multiplied by 1.844 gives the velocity of discharge of a metallic flume, uncoated, if the flumes are of equal dimensions and grades. The positive coefficient of asphaltum-coated flumes is 158.10; $158.10 \div 76.7 = 2.061$; so the velocity or discharge of a coated flume of equal dimensions and grade with a given wooden flume would be 2.061 times greater than that of the wooden flume. As between a coated and uncoated metallic flume, the coated flume will generate a velocity of 1.118 times the uncoated flume, both being equal in size, shape and grade. Therefore, the metallic flume will not require as steep a grade nor as great an area for the same carrying capacity as a wooden flume. Its great durability, in connection with this fact, suggests that it would in Arizona be the more

economical of the two. Where lumber is of poor quality and high in price, and steel or iron is cheap, small sheet iron or steel flumes may be economically made semi-circular in cross-section, and thus enclose the greatest area with the smallest possible quantity of metal or metal perimeter.

IT is not uncommon to have a manufacturer expressly warrant or guarantee an article to be of a certain grade or quality or specially adapted and intended for a specific use. Concerning the liability of a manufacturer upon goods which he has not expressly warranted in writing or otherwise, there is a presumption that because of the character of the article the warranty was implied. A general rule can be stated that when an article is ordered to be manufactured for a particular use or purpose there is an implied warranty that it is to be reasonably fit for such purpose. But when the article ordered was to be of a peculiar design or description, when defined and understood between the parties and the article was made in pursuance of the specifications, then no warranty is implied further than that it should be of good workmanship and material and should be well put together. Where a maker delivers an article just as it was ordered, without regard to its use, he can not be held to have implied anything beyond the skillful making of the article. But there are cases where manufacturers make an article which they advertise to be for a specific purpose. In that case there is an implied guaranty that under proper conditions it will do what is claimed for it.

MINERS are sometimes apt to decry promoters as middlemen who get the largest profit and who hurt the mining industry. But as there is a difference between a prospector and a miner, so is there a difference between a miner and a promoter. The prospector finds the claim, the miner works it and the promoter sells it to men who equip it with machinery and give employment to miners. Mining camps which attract good and honest promoters are apt to come to the front much faster than those without them. The promoter hunts up the mine, finds out the facts about it, gets his reports and maps, and then goes to the centers of capital to get the proper men to take hold of it. The miner himself does not know how to do this part of the business, and it takes a great deal harder work to find men to buy mines than it does to find mines to sell. The promoter has his place in the mining industry and serves a useful purpose by getting the miner money for his claim. There are hundreds of miners all over the country having claims for sale, but few of them know how to go about it. Those who come to the cities seldom sell their claims except through the intervention of third parties who bring seller and buyer together. Only those who have tried it know how hard it is to bring to a successful conclusion the sale of a mine at a high figure. It takes hard work and a certain amount of business knowledge which the miner sometimes lacks. A few good enterprising promoters can drive away hard times from a mining camp, by bringing in the necessary capital to develop the mines, put up mills or smelters, build roads and otherwise inaugurate an era of prosperity.

THE mining code of Mexico differs materially from that of the United States. In our sister republic any person, foreign or citizen, can locate as many claims or "pertenencias" as he feels able to handle, each claim being 100 meters square; provided, however, that no foreigner can locate mines within the free zone—for a distance of 52 miles from the boundary line—without obtaining special permission from the government of Mexico. Having made his locations, he presents a petition to the mining agent of the district in which they are situated, asking that they be adjudged to him in accordance with the law. The fees for registry, publication, stamps, etc., should not exceed \$12 (Mexican), but are generally about thrice this amount, the official schedule being adjusted to suit the climate. If the petition is admitted, as it usually is, upon payment of the fees it is regularly filed for registry, and within three days thereafter an order for survey is issued. Theoretically, any competent engineer can be selected to make the survey, but as the question of competency may cause complications it is better to accept the party recommended by the district agent. When the survey is returned the agent makes an extract from the registry and causes it to be published in the official paper of the State, citing adverse claimants to appear and show cause, as in the case of the U. S. patents. At the end of four months it is the duty of the agent to forward to the federal department of public works a transcript of all the proceedings, and if these are found to be regular, and the stamp duty of \$10 is forthcoming, a title is issued. The cost of surveying is generally \$15 for each claim, when there are many, the minimum cost of survey being \$100, but this expense is affected by distance and other variable conditions. The only limitations to the absolute ownership of the mines is an obligation to pay an annual tax to the federal government of \$10 per annum on each claim, payable every four months. If this is not paid promptly a maximum extension of three months is granted on payment of fines of 25%, 50% and 100% additional for each month, respectively, and a complete failure to pay is held to be an abandonment of the property, which then reverts to the public domain. The State government collects a maximum tax of 2% on the gross product of the mines (which can be avoided by letting them lie idle) and \$6 per \$1000 on the assessed value of improvements. The assessment is made by an official expert appointed for each district.

Some Further Questions and Answers.

In the issue of October 18 appeared two pages of questions and answers in addition to the usual page of "Concentrates." Further overflow necessitates the use of a little more extra space this week. On the "Concentrates" page the questions themselves are omitted, and the answers concentrated to the briefest possible space. If all the questions asked and their answers were each week printed in full, there would be little room for anything else. Hence the necessity for compression.

Could you inform us who purchases manganese? We have a mine of it. What are the principal uses for the metal?

Sacramento, Cal.

The Illinois Steel Co. are among the most prominent buyers. They determine the price of manganese ore on a schedule based on ores containing not more than 8% SiO₂ and 0.1% P. Ores delivered at their works, South Chicago, Ill., are settled for on a basis of analysis of samples dried at 212° F., the percentage of moisture in the samples as taken being deducted from the weight.

California produced about 600 tons of manganese ore last year. The total 1901 United States production was 638,795 tons, worth \$1,644,117. There were imported during 1901 256,252 tons, valued at \$2,042,361.

It is in usual demand in this west half of America for flux in smelting silver-lead ores; in steel manufacture east of the Rockies, imparting a hardness and toughness. The commercial value of the Sacramento deposit would be governed largely by possible local demand.

Here is a question I wish you would answer: A had a quartz mill. It was nearly destroyed by fire. In due time the county assessor assessed it (the wreck). A did not pay the taxes. The county bought it in and let it lie on the ground twelve years. The ground was open for location. B came along and located a mining claim, taking in the wreck in his location. Can the county claim any right to the old machinery, and did it belong to B? Can they still hold it for the taxes?

Yerington, Nev.

This would afford a fine chance for a lawsuit. In law any "improvements" upon public lands of the United States pass to the purchaser from the Government. In the case of Meyerdorf vs. Frohner, 3 Mont., 282, 320, it was held that the relocater of a mining claim holds his estate by purchase. It has been held that a hoisting works, pump, or mill annexed to the soil for mining, become part of the freehold. "Lindley on Mines" says: "As such, they will pass to the relocater."

The Lyon county, Nev., assessor could probably be prevailed upon to waive any rights to partially burned mill appliances that have been lying exposed to Nevada weather for twelve years, though if the county had sold the property for "delinquent taxes," the buyer might be in evidence if the relocater ever made the claim valuable by development work. Then there is the problem of what right any State or county has to assess unpatented mining claims. Our advice would be to dump the old ruins off on adjoining ground, and thus solve the problem. They can not be of much practical good. If a mill is needed, an up-to-date one would be cheaper.

What advance per day would you consider good in sinking an incline shaft (45° pitch), 6x8, medium hard rock, but breaks well, two shifts of eight hours each, two men per shift, hand drilling, shaft 140 feet deep, the miners doing all timbering, track laying, lowering pump, etc.—taking up probably one-fourth of their time—shaft making about 500 gallons water per twenty-four hours, hoisting being done with a gasoline engine and self-dumping skip?

Cedar, Ariz.

[The above question was referred to Mr. H. P. Stow of Butte county, Cal., for reply. Mr. Stow's answer is published verbatim, to illustrate that an answer of fullest value would require more definite detail of information on which to base accurate answer.]

Yours at hand enclosing the inquiry about sinking a shaft. It is impossible to give anything like a definite answer on the data furnished, but I should say about 25 feet a month, working every other Sunday, would be a good average. If it is of sufficient interest to your inquirer to answer the following questions, I should be glad to give another opinion:

What is the kind of rock the shaft is being sunk in?

Are both (or either) walls in the shaft, how far apart, and does either wall carry a gouge?

Are your dimensions given—6'x8'—inside or outside dimensions, what is the size of the timbers used, and how far apart in the shaft?

Why do you use a pump with only 500 gallons of water in twenty-four hours, and what kind of a pump is used?

What is your present average per month?

Do you drill single or double handed?

How many holes a shift do you put in and how often do you blast?

What kind of powder do you use, and strength?

What is the capacity of the skip, and how many skips do you hoist in twenty-four hours?

In only working two shifts, why do you work eight instead of ten-hour shifts?

If ——— can think of any other information, it would be well to state it. It is difficult for a man unfamiliar with a district to give a close estimate on work, unless he has all the data possible, and what might be considered medium hard rock in one district would be considered quite different in another. The kind of formation and character of the rock will go a long ways towards telling how hard it is.

When I drilled here by single hand, if a miner averaged 6 feet a day of ten hours in quartz he was doing good work. The quartz was unusually hard and tough and wore the gauge off the drills very rapidly. In sinking my shaft here, using a 2½" air drill, working two men to a shift, three shifts of eight hours, shaft 5'x7', some of the ground timbered and some not, one wall with a gouge, probably about 250 gallons of water per hour, we averaged 60 feet a month. The miners did all the work, except hoisting, that being done by a compressed air hoist. Shaft about 40° pitch. The rock was greenstone of the hardest kind and required from six to fourteen holes to the round, and averaged about one round in twenty-four hours. A soft seam about 2 feet thick crossed the shaft diagonally part of the way, making the drilling easier and quicker, but requiring timbering, so the advance was about the same.

H. P. Stow.

Forbestown, Cal.

What kind of iron does magnetite or black sand make? Is there any method of converting it into pig iron?

Sacramento, Cal.

A process of thus manufacturing iron has been devised by F. C. Cream of Montreal, Canada, who has a patent on it. He professes ability to utilize loose granular magnetite, or what is known as "black sand," for the manufacture of cast iron, steel, nickel steel, and any alloy including iron the component parts of which have an affinity for iron. An ordinary foundry ladle or crucible is charged with the molten metal, mixed with the black sand, which has first been cleaned of silica, titanium and other foreign substance, the proportion of cleansed sand varying according to the grade of hardness required in the product. As an example, the specific method may be described of producing an iron having a breaking strength of 78,400 pounds in bars of 12 inches length and 2.99 inches by 2.93 inches cross-section. In the production of these bars a foundry ladle is charged with molten pig iron, 66%, to which is added, immediately the pig iron is poured from the furnace, 34% of clean loose granular magnetite or black sand at its natural temperature. This mixture is stirred a few times and the iron is complete. A test of this iron and of iron with different proportions of pig iron and magnetite in bars of different dimensions give the following results:

Composition.		Length. Inches.	Bars. Cross section. Inches.	Breaking Strength. Pounds.
Molten Pig Iron—%.	Magne- tite. %			
84	16	12	3.02x2.98	68,000
80	20	12	3.01x2.98	73,800
76	24	12	3.00x2.98	75,600
66	34	12	2.99x2.93	78,400

The inventor found a difficulty in treating large quantities and in alloying the iron particles of loose granular magnetite and a metal having an affinity for iron, in causing the molten metal and loose granular magnetite to mingle. The molten metal, if the magnetite were placed in the crucible first, would run over the top of and combine with only a small proportion of the magnetite, and the same would be the case if the molten metal were first poured into the crucible and the loose magnetite poured on top of it. To obviate this difficulty and cause the molten metal and loose granular magnetite to mingle thoroughly and combine with one another, a predetermined quantity of the loose granular magnetite is supplied through a tube to a predetermined quantity of the molten metal in the crucible, the tube being gradually raised from the bottom through the mass of metal in the crucible while the magnetite is being fed through, thereby causing the magnetite to be thoroughly distributed throughout the metal in the crucible, or, if desired, the molten metal can in a similar manner be fed through the tube into and distributed through a body of loose magnetite in the crucible.

We have a ledge of soft substance varying from 3 to 5 feet wide running down against a ledge of quartz. The quartz lies on the foot wall side. We have not struck the foot wall yet, but have a well-defined hanging wall of porphyry. This soft ledge matter is full of black mica and will prospect in fine gold from \$4 to \$10 per ton. It resembles soapstone, has an oily feeling, with no grit only where there are little stringers of quartz in it. In color it is from a light chocolate to almost black. It is a new substance for gold here to the miners. We have a shaft down 14 feet on it now 5x7 feet. This ledge is on a creek that has been worked continually since 1852, with a great deal of coarse gold taken out.

Callahans, Cal.

This is another puzzler, because of only partial

presentation of the facts. Even assuming the description is correct there isn't enough told nor is it told in a detailed way. It is probable our inquirer has run against a dyke that has become kaolinized. He might send a sample of the stuff to Mr. E. B. Preston, California State Mining Bureau, San Francisco, Cal., not for assay, for the Mining Bureau doesn't do that kind of thing, but for qualitative analysis. To attempt determination of minerals from mere outlined description is a difficult task.

Will you kindly give in "Concentrates" the use of zinc acetate in assaying?

Portland, Or.

There is nothing in assaying which requires the use of acetate of zinc. But acetate of soda is often used in making humid silver assays when there is mercury present in the silver, the acetate of soda being added to the solution of silver nitrate before adding the salt solution, this prevents the precipitation of any mercury.

Will you kindly explain in "Concentrates" why tungsten sells as high as it does? What are the methods of reduction from its ores? I have heard that in reducing it they have difficulty in getting rid of the iron and make a very uncertain product. Is this so? Would a method which reduces a pure article at a normal price be an improvement on the present methods of reduction?

Somerville, N. J.

Tungsten is not considered as selling at a "high" price, when the situation is viewed. There is a very limited amount used, and, as in all such cases, overproduction is easy. The present price of the ore is considered to be low, being about half what it was two years ago. Ore carrying less than 40% tungstic acid is not ordinarily deemed available: averaging from 45% to 55%, it will bring about \$2 per unit; ores running from 65% to 75%, from \$2.50 to \$3 per unit, if free from phosphorus and sulphur. It requires considerable chemical and metallurgical skill to deal with the ores successfully. Considerable wolframite is sent from Spain to Germany. There are also works at Battersea, London. The ore is first crushed in ball mills, and is then roasted in presence of soda, with the object of producing tungstate of sodium. This substance is leached out, and then, by the addition of an acid, the tungstic acid is liberated from the soda and separated out by a filter press. The final operation is conducted in crucibles, as a very high temperature is required. The tungstic acid, mixed with charcoal, is charged into these crucibles, which are placed in a furnace of the same type as that used for steel making. Here the oxide is reduced and gradually recedes to the bottom of the crucible, where it is found in a fritted mass. The series of operations sounds simple; but it is difficult to carry out successfully, as a very slight change of temperature upsets the reactions. The Great Western Exploration & Reduction Co. of Boulder, Colo., is reported to be experimenting along the lines suggested in the last question from our New Jersey correspondent.

Several times I note reference to cyaniding gold ore without crushing or pulverizing. Is it feasible, and where could I have particulars of the process?

Mercur, Utah.

It is not at all uncommon to treat gold ore by cyanide without fine pulverization. In the process of M. Baxeres de Alzugaray for the extraction of gold and silver the ores are crushed in the ordinary way, but without being pulverized, and are soaked in a solution of cyanide until the mass can be moulded with the hand. In general, the proportion of the liquid employed may be about 5% of the weight of the ore to be treated. The ores are afterwards passed to the sifter in a receptacle which can be hermetically sealed, and a gaseous mixture of bromine and oxygen in varying proportions is conveyed slowly through the mass from top to bottom. The gaseous mixture, traversing the crushed ores, acts on the metals and forms soluble salts. The excess of the gaseous mixture goes to a condenser. After this treatment the mass of ore is washed with warm or cold water, which separates the soluble salts of the metal and leaves them in a state of solution. From these solutions the previous metals are obtained by precipitation with zinc or some other metal, as ordinarily, or by electrolysis. In this process, instead of the employment of cyanogen in dilute solution, a concentrated solution is preferably employed, obtained by dissolving about 450 grams of cyanide in about 4½ kilos of water.

For the latest reported successful cyanide practice on ore direct from the grizzly the Mercur inquirer is cited to operations at the Cummings mine, Callahan postoffice, Siskiyou county, Cal. At that cyanide plant so much difficulty had been found by fine grinding and subsequent slimes, making leaching hardly profitable, that Superintendent Jas. McKeen and F. Lundstrom, in charge of the cyanide plant, concluded to experiment with coarse material.

(It is to be noted in connection therewith that the gold values were contained in an oxidized pyrite, and that the ore in breaking in the mine, as well as in the breaker, always broke where the structure of the ore had been weakened by the intrusion of a pyrite.)

The results of the first tests showed that 80% of the value of the ore could be extracted from the

material directly from the rock breaker—that is, all material that passed through a grizzly with bars set 1 inch apart on an incline of 45°. This material was in no case larger than 1 inch pieces. The greater part of the material, however, was broken to about ½ inch or finer; the consumption of cyanide in the treatment was ½ pound per ton of ore; the time of treatment seventy-two to ninety hours.

As in many other cases, it is to be noted, also, that this was only admissible because of the values being contained in the oxidized pyrite. Doubtless with depth resulting sulphurets would require finer crushing.

All the papers here say that gold nugget recently found by a Chinaman at Salmon creek, worth \$15,000, is the largest ever found in the United States. Is that so? I think bigger ones have been found in California.

Baker City, Or.

Several of them. The tale has often been told. There is a column on that subject in the issue of July 12, 1902. The largest mass of gold ever found in California was dug out at Carson hill, Calaveras county, in 1854, and is said to have weighed 195 pounds.

In a recent issue you mention "carnotite." What is it, and where is it found?
Salt Lake City, Utah.

It is a mineral, found near Georgetown, Colo., and also at La Salle creek, near Paradox, Montrose county, Colo. The specimens found at the latter place carry 47% uranium oxide and about 16% vanadium oxide. It is also reported found in the La Salle mountains, southeastern Utah, in the same general locality as that mentioned at Paradox. The two metals it carries are of increasing value in the arts, being used as alloys of steel, in the manufacture of porcelain and glass and also in the manufacture of a fine yellow pigment. More detailed information might be had by addressing the Mine & Smelter Supply Co., Denver, Colo.

Ogden and Lucin Railway Cut-Off.

Written for the MINING AND SCIENTIFIC PRESS.

For more than thirty years the Southern Pacific Railway, in its course westward from Ogden, Utah, has made use of what is known as the old Promontory route, which runs northward from Ogden to Corinne, Utah, and thence westward over Promontory divide. This old route required helper engines for all trains going east or west over the divide, and, moreover, it was a feature adding length to the main line of the road, as well as a constant extra expense. The early engineers, in their topographical work, saw but two routes to use in the construction of a railway line to California after reaching Utah. One was the present old route by way of Promontory and the other was by passing south of the Great Salt Lake and thence running westward toward Pilot Peak, converging into the present line about Lucin. The latter route was considered impracticable because of the desolate region to be traversed westward from Salt Lake City around the south end of the lake, which route would cross the most dismal part of the great American desert.

It is doubtful if those who managed the early construction of the Southern Pacific Railway thought it was possible to find a shorter route than the one taken. In those days it was not thought that it would ever be necessary, even if possible, to find a shorter route than the one then surveyed. It is quite true that as it was first constructed, with all its grades, crooks and curves, it was a vast improvement upon the hull and mule teams of the old days, which required three months to toil out the weary journey from Weher canyon to Sacramento, and when people were able to make the trip even in seven days and for less money they considered themselves very much favored by fortune.

However, as the years went on, the traveling public began to find fault with the journey from Ogden to San Francisco over the Southern Pacific Railway. It was remarked by the average traveler that the road bed was poor and the line was much longer than it should be.

With such conditions as these existing it was not surprising if those representing large capital should look over the field to see if there was not some way by which a shorter and better road might be built from Ogden to San Francisco, especially when the business to be obtained promised large returns even from a division of the business transacted by the Southern Pacific Co.

It was about the year 1889 that one Lieutenant Von Gorp, who had been in the service of the Russian government in the survey and construction of the Transsiberian Railway, and especially in the very difficult portions of its construction around and near Vladivostok, came to the United States to look over the railway situation in the interest of Dutch capitalists, with the intention of investing in new railway projects in America. In New York City he was met by certain promoters, who laid before him a scheme for the construction of another Pacific railway, to start from Ogden, Utah, leading across the lake and

touching the lower end of Promontory point, thence across the desert to Lucin, after which the route lay north of the present line of the Southern Pacific, and running near old Fort McDermott, out through Beckwith pass, down to Marysville and thence into San Francisco. A preliminary survey was made. The lake cut-off was found to be in every way practicable and the scheme of building another Pacific railway was taking tangible form when the failure of Baring Bros. of London and kindred disasters threw a cloud over all American railway schemes, in either North or South America. Lieutenant Von Gorp returned

The Trestle Bridge Being Built Across Salt Lake by Which the S. P. R. R. Will Save 42 1-2 Miles Distance.

to Europe and the undertaking was abandoned for the time being, but the writer of this article, who was associated with the proposed road, prepared an article for the Ogden Standard, then published by Hon. Frank J. Cannon, who later became United States Senator from Utah. The article was descriptive of the road as surveyed across Salt lake, and it was this portion of the article which chiefly attracted public attention, along with the fact that it promised a competing line from the East to enter San Francisco. The newspapers of the latter city copied the article, as did also the Railway Age. Most people looked upon the Lake cut-off part of the proposed work as an utter impossibility, even Salt Lake City newspapers proclaiming it the scheme of dreamers.

However, the then manager of the Southern Pacific Railway looked into the nature of the proposed cut-off, and later, finding the work of building across the Great Salt lake not only possible, but a most advisable undertaking, the work was resolved upon, finally culminating in the present construction. I will further remark here that there is but little difference in the line as it runs from Lucin to Ogden from the route marked out by Lieutenant Von Gorp. The writer of this article throws the above light upon the inception of this work, as it has been a question with many as to who may be credited with the original idea of this great undertaking.

To give a short descriptive sketch of the cut-off construction, I will state that the new line runs almost directly west from Ogden until it reaches what is known as Little Round mountain, which mountain rises near the eastern shore of the Great Salt lake at a distance of about 16 miles from Ogden. From the south end of this mountain the road deflects slightly to the northwest and thence over the waters of the lake it takes a tangent line to the eastern shore of Promontory point. Crossing the point for a distance of about 4 miles, the road again strikes the west rim of the lake and crosses about 20 miles of water, reaching the shores of the Great American desert near Strong's Knob, and thence across the desert to Lucin.

The length of the new line thus constructed from Ogden to Lucin will be 102 miles, being a tangent line across an almost dead level, against 146 miles by the former route, with the heavy grade of old Promontory pass, thus saving for all time a distance of 42 miles, with easy grades thrown in.

In crossing the lake the road bed is built by using material taken from Little Round mountain at the east shore, with which to construct a great part of the road bed through the lake. As the waters of the Bear river, entering from the north, have to be bridged, about 1200 feet of piling is being driven into the lake bottom, and for this purpose cedar piles 70 feet in length have in many instances to be driven double, one following the other, so deep is the soft clay in the channel of Bear river. Being thus crossed, a rock causeway similar to that from the east shore is carried out from the shore of the promontory, and from the west shore of the promontory the road bed is constructed for a long distance into the lake by using rock taken from the cliffs of Promontory point. Midway in the west arm of the lake piling of great length is again used and continued until reaching the rock work which extends into the water from the western shore.

In building this causeway into the lake the first steps taken were to place at intervals of about 10 feet abutments formed by sinking bags of sand and

upon these stringing heavy timbers, on which are placed cross ties, and on these again the rails. In this way the loaded rock and gravel trains go forward into the water and the loaded cars are emptied into the lake from this side track, and as the long rock dyke rises it is leveled and widened until it is about 4 feet above the water and about 20 feet in width. The track is then placed and trains carry forward material for the later work beyond. When completed, this causeway or road bed will be 75 feet wide at the bottom of the lake and will rise almost 16 feet above the level of the water, thus making it

not only a most substantial work, but leaving no danger of the stormy waves of winter interfering with railway travel. To facilitate work, a number of wooden vessels have been constructed at a shipyard midway in the lake, and are used in towing timbers and carrying supplies along the line of construction through the lake. All kinds of heavy machinery used in modern railway building are brought to bear upon this work. The undertaking of crossing the lake is a difficult one, but the engineers are equal to the task. Even as I write, after only five months of labor, the work of construction is carried from the main shore on the east side to the promontory, where the work of building the road bed for a distance of about 4 miles is being done by the Corey Bros. of Ogden, Utah.

South of the line of the new road bed on the promontory the land slopes gently to the water's edge, where a pebbly beach will permit the erection of extensive bathing resorts in the near future, without the liability of the water receding far beyond its present shore line, as has been the case at the Salt-air bathing resort on the southeast shore of the lake.

From Ogden to the east shore of the lake the road bed is constructed after the most modern methods, with steel bridges, as at the Weber river crossings, and steel cylinders with cement facing where any irrigation canal or small stream is crossed. The road over the lake will at its surface be nowhere less than 20 feet in width, 16 feet above the water, and in most places its base on the bottom of the lake will be from 50 to 75 feet in width.

From the time the water line is reached at the lake shore to the promontory, and from the west side of the promontory to the west shore of the lake, all of the work is being done by the Southern Pacific Co., under the superintendence of their own engineers. As is frequently the case in work of this kind, unforeseen difficulties arose in road bed construction. For example, at many points where prior to the commencement of work it was thought that solid ground existed to interminable depth it was found that a thick measure of mud laid under the salt crust, over which heavy planks were laid and the lumber work and rails for the temporary track carried along upon these. The waters of the lake have been made a help in the great work, as all of the heavy timbers, such as ties, piling, stringers, etc., are floated to the points where wanted. While the warm sun of the summer months was upon the waters of the lake it was not difficult to find men who would take to the work of construction in the water, in which they waded at times to their arm pits, but as the cold increases through the fall and winter it will be different, and the work of construction will necessarily be slow for a time.

The management, planning and execution of this great work are due to the ability of William Hood, chief engineer, of San Francisco, and his able assistants, Messrs. W. E. Marsh, J. H. Austin and Michael Harney. To each of them the fact that they were associated with the work of building the cut-off through Great Salt lake will serve as a monument to the personal history of each in the years to come.

In contemplating this great work, how the mind reverts to the past, when General John C. Fremont, standing on the shores of the Great Salt lake sixty years ago, viewed the wild, weird desolation of the then desert region surrounding the great lake—the locality itself the center from which in either direction 1000 miles of uninhabited wilderness extended, tenanted only by savage Indian tribes, herds of wild buffalo, millions of deer, thousands of bears and numberless coyotes, rattlesnakes and lizards, all holding sway without molestation by civilized man. At that time San Francisco was a little Mexican post, with less than 300 inhabitants, on an almost unknown shore. At that time millions of ounces of virgin placer gold rested in the silence of the foothills and in the heights of the upper Sierras of California, and the Plute or Shoshone Indian made his sagebrush fire and broiled his jackrabbit over the spot where lay all the mighty wealth of the Comstock lode, over in Washoe, Nevada. A hundred gold, silver, lead and copper districts since made famous—from Butte, Montana, to Tombstone, Arizona—and now, O heavens! the buffalo is gone, the Indian is gone, the wilderness is no more, a hundred cities thrive where only desolation reigned on the morning when General

Fremont, with his few companions, stood on the shore of the Great Salt lake, and to-day we see a great transcontinental railway line building its road across the sullen waters of the lake, that the business along the great highway of nations may be quickened and shortened. Surely we live in an age the like of which was never known before.

The views accompanying this sketch* show parts of the work in constructing the Ogden-Lucin cut-off. They were taken during the month of September and show operations along the main line east of the lake and also in the lake itself.

Ogden, Utah, Nov. 1, 1902.

From the east shore to the promontory the lake is about 8 feet deep. This stretch will be filled in with earth and rock ballast after the temporary bridge has been constructed. The deeper portion across the main arm of the lake will be bridged. The deepest water—about 30 feet—is on this stretch, which will be on a tangent. The fall from Ogden to the east shore of the lake is 101.7 feet, and the rise from Strong's Knob to Lucin is 513 feet in 58 miles. The first material at the bottom of the lake is very fine sand from 6 to 30 inches in depth; then comes a hard stratum of soda formation 12 to 18 inches in thickness; after that alternate strata of sand and blue clay.

Notes on Sump Solution, Extractor-Box Work, and Cleaning-Up, in the Cyanide Process.†

By ALFRED JAMES.

One of the problems at present agitating the minds of cyanide operators is the effect on the extraction of gold by the continued re-use of the cyanide solutions. Such solutions contain, amongst other matters, salts of zinc, iron, occasionally copper, alkalies and alkaline carbonates, ammonia, and sulphocyanides; and it is obvious that, unless these constituents are prevented from accumulating in the solutions, the solvent power on the precious metals of any added cyanide must sooner or later be impaired.

Solutions which had been in use for some months were therefore examined, and the results noted: It was found that the extractions returned were in every case less than those obtained on the same material—ores or tailings—by making up cyanide solutions of the same strength with fresh water. Thus:

Extraction With Fresh Solutions.				Extraction With Used Solutions.			
Oz.	Dwt.	Gr.		Oz.	Dwt.	Gr.	
(a)	15	13	14	15	0	12	per ton.
(b)	20	18	3	18	13	16	per ton.
(b')	21	0	17	19	0	5	per ton.
(c)	3	17	2	3	13	5	per ton.
(c')	3	18	9	3	13	5	per ton.

It may be suggested that the presence of double cyanide of zinc and potassium (K_2ZnCy_4) may have misled the operator as to the strength in cyanide of the solutions, but it will be shown that this matter has received special attention, and that the results were similar, even when equal quantities of solid cyanide of potassium were added to fresh water and to a solution of double cyanide of potassium with caustic potash present.

Experiments were carried out with the object of overcoming this loss of power in the used or "sump" solutions, and it was found that the addition of lime improved the extractions from ores and tailings containing practically only quartz and gold, but that such treatment had a deteriorating effect on ores, etc., containing sulphides. Thus:

Extraction With Sump Solution Only.				Extraction With Sump Solution Treated With Lime.			
Oz.	Dwt.	Gr.		Oz.	Dwt.	Gr.	
(a)	12	15	2	27	0	23	per ton.
(a')	13	1	8	29	9	6	per ton.
(b)	18	13	16	25	14	4	per ton.
(b')	19	0	5	25	14	7	per ton.
(c)	4	1	1	3	1	0	per ton.
(c')	3	18	9	3	0	2	per ton.

With fresh solution the extractions in this set on c and c' were 4 oz. 1 dwt. 1 gr. and 3 oz. 19 dwt. 7 gr. respectively. a and h were simple quartz ores containing free gold, and c was an ore carrying a considerable percentage of sulphides.

A number of experiments were carried out on the above lines and the above results were confirmed. Lime being thus shown to be ineffective, except with simple quartz ores, treatment of the solutions with sodium sulphide, followed by excess of a soluble lead salt, such as acetate of chloride, was tried with the following results:

Extraction With Fresh Solution.				Extraction With Sump Solution.				Extraction With "Treated" Sump Solution.			
Oz.	Dwt.	Gr.		Oz.	Dwt.	Gr.		Oz.	Dwt.	Gr.	
(c)	3	17	2	3	13	5		3	17	2	
(c')	3	18	9	3	13	5		5	19	16	

It is thus evident that the continued use of sump solutions is a cause of serious loss in actual work, and that, though a universal law cannot be laid down for the best treatment of such sump solutions, it is strongly desirable that these solutions should, from time to time, be tested, and the results obtained compared with those from freshly made-up solutions; also that the addition of lime, with time for the subsidence of any precipitate formed, is of advantage in the case

of very free and coarse gold ores; and that the treatment with sodium sulphide, care being taken to avoid an excess, followed by the addition of a small amount of lead salt in excess, is efficacious where lime fails. In this latter treatment time must also be given for any precipitated sulphides to separate out and subside.

By such treatment the necessity of running foul sump solutions to waste may be avoided, when water is scarce or the cyanide of gold contents are high.

THE EFFECT OF ZINC IN SOLUTION.—The usual practice of precipitating the gold by running the aurocyanide solutions through boxes containing zinc, causes the accumulations in the solutions of a considerable quantity of zinc salts. It has been more than once suggested that the double cyanide of zinc and potassium in the presence of caustic potash was split up into a simple cyanide plus oxide of zinc and potassium—

The author, however, discovered by means of experiments involving the crystallizing out of the products, that the above equation did not hold good, but that, on the contrary, any oxide of zinc and potassium in solution combined with the added cyanide of potassium to form the double cyanide of zinc and potassium. Thus:

This shows that the zinc oxide in solution actually takes up the cyanide added by the chemist in charge to make the solutions up to normal strength, though the silver test leaves the operator in ignorance of what has happened, and thus renders it less effective for the solution of the gold than the cyanide by itself would have been.

The following experiments illustrate this point:

Extraction With a Fresh 0.5% KCy Solution.				Extraction With Portion of Same 0.5% Solution to Which 0.25% K_2ZnO_2 was Added.			
Oz.	Dwt.	Gr.		Oz.	Dwt.	Gr.	
(a)	2	9	0	1	11	9	per ton.
(b)	16	2	3	13	6	14	per ton.
(c)	1	17	21	1	2	20	per ton.
(d)	12	18	17	7	4	0	per ton.

This is one of the drawbacks of the zinc process as compared with the electrical deposition process, which leaves the solutions in a condition of much greater energy, though the iron anodes used in the latter process are necessarily detrimental. Insoluble anodes are much needed. The accumulation of zinc in solution is, however, prevented by the action of the sulphides contained in the ore and in the cyanide, and treatment with sodium sulphide and lead salt as shown above is a good remedy for this inefficiency.

LOSSES IN CLEANING UP.—Perhaps in no other part of the process are there so many variations in the methods pursued as in that of the clean-up. At the end of the hi-monthly or monthly period the boxes are charged with slimes containing usually gold, silver, lead, zinc, iron, lime, and, in certain instances, copper; and the object in view is the conversion of these slimes into bullion with the least possible loss. To accomplish this, the treatment varies from the direct melting of the coarse zinc and slimes to separation by sieves, roasting or acid treatment, with or without filter pressing, and subsequent fusion.

To determine, if possible, the amount of loss arising from these different methods, and the best general course to be adopted, a system of very carefully conducted experiments has been carried out and the results tabulated and compared.

At first the experiments were on known weights of metallic gold and zinc in the proportions used in practice; the gold was dissolved, precipitated from its aurocyanide solution by the zinc, shaken off the zinc in the form of gold slimes, the zinc remaining was dissolved separately and the residue added to the gold slimes, which were then treated by the various methods, and the amount of bullion recovered noted together with its fineness; the deficit from the amount originally taken represented the loss in treatment. In some cases the coarse zinc was disintegrated and dissolved by the addition of alkali and cyanide, instead of acid, with the results given below.

In the final experiments, however, to gain more accurate comparative results, a large quantity of gold slimes was made, shaken off the zinc, dried, well mixed and equal quantities taken from the hulk for the various experiments; these were carried out in duplicate, no two duplicate samples, however, were weighed consecutively. In the first set the losses were found to vary from 0.5% to 6%, and, as a general rule, the less handling the slimes received the less was the loss. The heaviest losses were due to roasting, and varied with the amount of stirring or handling during the operation; the least loss from this cause was 0.23% additional to that resulting from the rest of the treatment.

In a method of roasting with niter described in the Journal of the Society of Chemical Industry the total loss amounted to 2.57%, in spite of the greatest care in heating the mixture, and in addition as little niter as would act in the manner described in the paper; probably with prac-

tice this loss would be considerably reduced, but it is still too serious a matter to be lightly considered.

Acid treatment yielded results varying with the kind of acid used, nitric acid showing a greater loss than hydrochloric and sulphuric. On the other hand, with impure zinc—that in ordinary use—nitric acid gave the purest hulkion, but with lead-free zinc dilute sulphuric acid gave both the purest bullion and the lowest acid loss.

A comparison between melting direct and a preliminary treatment with sulphuric acid gave results depending on the purity of the slimes. Where these had been passed through a forty-mesh sieve to free them from coarse zinc, melting direct gave a fairly pure hulkion and at least as good results as with acid treatment; but with scrap and coarse zinc included, the advantage lay with the latter method.

The least total loss in the first set of nineteen experiments was 0.75%, and this was obtained by treatment with sulphuric acid before melting. An experiment with lead-free zinc gave a total loss of only 0.52% with direct fusion of the sieved slimes, the coarse zinc being treated with sulphuric acid and the residue added to the slimes. Pure zinc invariably showed a smaller loss than with ordinary zinc, and very careful work on identical lines showed such gain, or lessened loss, to be 0.2%.

Treatment of the slimes with strong solutions of alkali and cyanide, with or without subsequent acid treatment, gave heavier losses.

There was, however, considerable variation in the results obtained, though the general direction of the losses was well established; and to limit such variation, as well as to still further study the effect of the use of lead-free zinc in the cleaning-up operations, the final sets of experiments were carried out, in which all the samples were taken from the same hulk of previously prepared and well-mixed gold slimes, as mentioned above, and these samples were then submitted to variations in treatment. Similar experiments were also made with the slimes from lead-free zinc prepared under identical conditions. The results were as follows, the loss for simple melting with borax being taken as x:

Melting with borax.....	x
Roasting, then melting.....	x + 0.23%
Sulphuric acid, then melting.....	x + 0.17%
Sulphuric acid, roasting, then melting.....	x + 0.40%
Nitric acid, then melting.....	x + 0.29%

In the case of pure lead-free zinc x amounted to 0.43%; in the case of ordinary zinc it was greater than this, the amount of excess exceeding the 0.2% given above.

With lead-free zinc, sulphuric acid gave the purest bullion and roasting the most hase, the roasted hulkion being more hase than that melted direct with borax. With ordinary zinc, however, nitric acid gave the purest hulkion and sulphuric acid came next; direct melting with borax yielded hulkion considerably hase than the others. The loss by acid treatment was greater than with lead-free zinc, and the loss by roasting less. It is suggested that the presence in the slimes of lead, which is converted during the roasting to fluid lead oxide, may account for the lessened loss in roasting with the ordinary zinc.

These last results confirm those from former experiments, and show that with ordinary zinc, as well as with lead-free zinc, direct melting with borax gives the great loss, and that the safest method of purifying the bullion is by sulphuric acid treatment; that the use of lead-free zinc with a sieving arrangement renders any special method of purification unnecessary and diminishes the treatment loss. All the experiments agree in showing that roasting is the cause of more or less heavy loss, and, though effective with ordinary zinc in raising the grade of the hulkion, is less efficient than acid treatment for this purpose. It is therefore suggested that, in cleaning up, means should be employed to avoid handling and to limit the number of vessels used, and that roasting should be absolutely avoided. The following description of a plant has been prepared on these lines:

Zinc boxes (extractors) should have steel side launders for discharging the slimes direct through a forty-mesh sieve into small steel vessels with perforated bottoms, over which a filter cloth is placed. These steel vessels fit into small vats, one for each vessel, and are arranged so that the overflow of slimes passes into a large vat of sufficient capacity, from which the lighter slimes which have passed out of the small steel vessels in the overflow may be collected by the aid of a filter connected to a vacuum receiver, to which all the filters are connected. The slimes may thus be collected and sent to the drying and mixing plate immediately after cleaning up, the one vessel having sufficed for the whole operation; but if acid treatment is used, the steel vessel with its contained cake of slimes is taken to the acid vat and emptied into it. The acid vat may be of wood, lead-lined, or of steel coated with special protective varnish, or of aluminum, which answers perfectly and is clean and is not attacked by sulphuric or even nitric acid. The dissolved slimes are washed with hot water and filter-pressed, or preferably run into a detachable steel-lined filter vat with a vacuum connection, washed, vacuum dried, mixed with fluxes and melted. The author prefers a vacuum vat in place of a filter press as being cleaner, easier to handle and leaving the slimes in one mass without the

* See Page 262.

† From a paper read before the Institution of Mining and Metallurgical Engineers.

inconvenience and loss attendant upon the use of the many connections, plates and filter cloths (all impregnated with gold slimes) necessary to a filter press.

PURITY OF GOLD BULLION.—The fine, amounting to from 3d to 1s 9d per ounce of fine gold, imposed by the London refiners upon base bullion containing lead, has caused much attention to be paid to the question of the advisability of returning bullion so pure as to avoid these heavy charges. An investigation has also been made into this matter, and a suggested remedy is to replace the zinc ordinarily used for precipitation by a special brand of lead-free zinc.

In the early days of the cyanide process the investors feared that lead-free zinc would not be sufficiently energetic to precipitate effectively the gold present in very dilute solutions; but in recent experiments with some lead-free zinc, which contained a minute amount of iron, it was found in every instance that, whether with strong or with exceedingly dilute solutions, a better extraction was obtained with this zinc than with that ordinarily in use, with the single exception of a fortnight's run, in which the results were equally good.

The importance of this result will be understood when one recognizes that the adoption of the lead-free zinc will give a purer bullion, and thus avoid the refiners' charges of, on an average, 9d per ounce and will lessen the amount of slimes to be treated and the loss during cleanup of 0.2%, as shown above. Against this is the greater price of the lead-free zinc; but as it takes with low-grade tailings an average amount of one pound of zinc to produce one ounce of gold, it is easy to calculate that, even if lead-free zinc were 11d per pound dearer than the ordinary zinc, it would still be preferable and cheaper to use the former brand; but, as a matter of fact, the difference in price is very much less than this sum.

In conclusion, it is suggested that increased extractions may almost universally be obtained by the proper treatment of sump solutions, or, where water is plentiful, by the making up of fresh solutions from time to time, the old solutions being got rid of as water washes after an intermediate period as weak solutions; and that much of the usual "mysterious" discrepancy between theoretical or assay results and the amount of bullion actually returned is due to losses in cleaning up, and that these losses may be lessened by avoiding roasting and unnecessary handling, and by adopting the precautions detailed above.

The gain to the Witwatersrand Gold Fields from the treatment of sump solutions should be an additional extraction of 5%, or, say, £200,000 per annum, while the avoidable loss in cleaning up is estimated to vary from 0.5% to 2% of the cyanide output from each particular plant.

Width of Sluice Plates.

TO THE EDITOR:—In the article entitled "Stamp Mill Construction," in the issue of Oct. 4, by J. J. Deming, there is one statement which I think is open to discussion, a statement frequently made by other writers on amalgamation.

Theoretically, and by logical deduction, they are correct, but practically in error, and as they must be borne out in actual practice, it is necessary to change it to fit a particular case.

Theoretically, gravity exerts a greater influence on metallic constituents than on the matrix of an ore, giving the present general method of ore concentration, except where the buoyancy of the metallic contents overcomes this gravity; but the new method of using crude oil raises the valuable portions to the top, and, stranger yet, this same oil will not absorb the siliceous and other non-metallic particles.

On the same principle, theoretically, the sluice plates, when used at all, should be of the same width as the apron plates, as stated by Mr. Deming, but in practice a width greater than 24 inches and, better, 20 inches, is more of a detriment than a benefit, and it is preferable to abstain entirely from using a greater length of full width plates than 8 feet, leaving out sluice plates, unless of the smaller width stated above.

I think it has been conclusively proved everywhere that clear water in the quantity passing through a 5-stamp battery, when crushing ore, will carry off both quicksilver and amalgam if allowed to run over the full width plates for any length of time, and when a battery is hung up this water is reduced to just enough to keep the plates wet.

It has also been proved that the friction of harren sand crushed in the mortar will very rapidly denude a plate and that there is required a constant addition of fresh quicksilver and gold in the ore to enable the amalgam previously caught to be retained on the plates. I am, of course, speaking of conditions where proper amalgamation is practiced, the plates neither too dry nor too wet, with the proper pitch, so that the practical total of amalgam is caught within a foot of the lip of the mortar. Some men, with plates 100 feet long, have the unhappy faculty of collecting all the amalgam in the last foot or two, but it is not for them I am writing.

Under correct amalgamation, therefore, the pulp

and water carry a mere modicum of amalgam and quicksilver by the time the lower end of the apron plate is reached and the friction of harren sand over such a wide surface as the 4 feet will prevent any profitable collection of amalgam. Yet over the smaller surface of 20 inches, always at a less grade (about 1½ inch to the foot), owing to the greater clearance of the sulphurets and the concentration of the pulp, the amalgam by its gravity will be attached to the plate in sufficient quantity to be collected. There should be no free gold, unamalgamated at this distance from the mortar, and, therefore, the pulp does not require to be turned over in the waves as it does on the apron.

No matter how great may be the care and many the appliances, some amalgam and some quicksilver will escape, and even below the trap in a 4-inch sluice, at a grade of ½-inch to the foot, a groove or cross riffle will accumulate an appreciable amount of amalgam and quicksilver in the course of a month's run. In 1889, in replacing the worn out tailings sluice below the Golden Star mill of 120 stamps at Lead, South Dakota, sufficient amalgam was found, where the pulp from each ten stamps fell into the sluice, to pay the entire expense incurred.

This fall was from 1 foot to 15 feet and each stamp was crushing four tons every twenty-four hours. This was not owing to faulty amalgamation, as the tailings below the apron plates never assayed over 50 cents per ton, and the ore carried practically that value in its sulphurets and coarse sand.

Before speaking of another important argument in favor of 20-inch plates, the advantages for saving the amalgam are:

First.—The less grade needed and the consequent greater effect that gravity exerts.

Second.—The less danger of the plates being coated by heavy sulphurets or even sand, and hence the greater facility by which the amalgam can touch and be attached to the copper plates.

Third.—Owing to the narrow surface and the small quantity capable of being saved, that the amalgam is in shape for economical removal at each cleanup and does not require any sweating to remove the thin scale which would form on the wider surface.

Fourth.—That just as much settles on a 20-inch plate as would settle on one 4 feet wide, in the same relative position to the lip of the mortar.

The other argument, that has more weight than is generally supposed, is in the hearing it has on the subsequent treatment of the pulp to save its mineral contents.

Owing to the friable nature of the sulphurets, and their tendency to slime, every effort is made to get the pulp away from the battery and to the concentrating device, with the least crushing in the battery, or long frictional abrading in the sluices. So much so, that without inside amalgamation, the discharge is made instantaneous, and other crushing methods employed in preference to stamps, while in stamp batteries the shape of the mortar has been changed and improved till no ore of sufficient fineness to discharge through the screen receives a second blow and the sliming of the sulphurets is reduced to a minimum. But after leaving the battery, the friction of passing over the plates, the very rolling motion in the waves over the apron plates, adds appreciably to this sliming and must be prevented as soon as possible. Constant practice has shown this to be feasible in a maximum distance of 8 feet, and then the less grade but more easily moving capacity of the 20-inch sluice plate can be employed, saving all the amalgam possible to be saved, while reducing the actual amount of sliming of the rich fragile sulphurets, the richest varieties being always the most fragile. With a length of 8 feet to 12 feet of sluice plate, the pulp can now be carried in a pipe or 4-inch sluice at a less grade, thus further reducing the difficulty the concentrators have in saving these richer sulphurets. Even in cyaniding, better results would be obtained through easier percolation of the cyanide solution and filtration of the gold solution.

The original cost of the plates is a factor that is of little account because no primary expense should be taken notice of in the equipment of a gold mill that would add to its efficiency; but there are other advantages obtained (in my experience in using both methods), with the 20-inch plate, about which I think it would be superfluous to enlarge in addition to those already cited.

W. J. ADAMS, E. M.

San Francisco, Cal.

IN "Notes on Naval Progress," by Lieut. C. L. Poor, issued at Washington, D. C., are official data on the value of fuel oil compared with coal. The Dutch torpedo boat Pangrango, using 700 pounds of oil per hour in addition to its regular consumption of 2800 pounds of coal, secured an added speed of two knots without making smoke. The North German Lloyd vessel Tanglin, burning oil only, secured a speed of one knot per hour greater than with coal, and at less cost for fuel. She consumed thirteen tons of oil daily, as against eighteen tons of English and twenty tons of Japanese coal, and it required but one fireman in place of five. Recent tests of Texas oil and coal made in a stationary boiler furnace by Prof. Denton of Stevens Institute, Hoboken, N. J., showed that 1360 pounds of oil equaled 2240 pounds of coal.

The Finer Issues of Mining.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

Some hunters have laid down the rifle to take up the camera. In place of the bleeding carcasses of great and small game about which a hostful tale can be told they are able to show us hooks of glimpses into wild life in its native haunts. The wilderness and the desert are made to tell us again their tale of life, a tale of beauty as well as the beast, of high contrasts of grace and deformity, and all the deeper attributes, cunning, and humor, and coquetry, even benevolence and many others which have their expression in animal as well as in human life. This is one of the finer issues of sport, the common killing, long the main object of sportsmanship being a coarser issue.

The main, yet I am bound to say the coarser issue in mining, is to get gold, or if not gold directly, some of those forms of mineral value which by the alchemy of commercial exchange can be transmitted into gold. The coarseness of this issue is very apparent when a miner having struck it rich and acquired sudden wealth proceeds to blow it in on such delights as appeal to him, the excitements of wine and gaming, grotesque display, and a high speed life that lands him ingloriously in the more misery. Far he it from me to suggest that this is the course of the typical miner. He is very likely to be a shrewd and thrifty user of wealth, like Mackay he lays cables, like De Lamar he plans to go from wealth to wealth, giving his name to great metallurgical works and towns in several States advancing the art of mining, like many another he turns to politics, or to that small, but distinguished reserved box in politics—the United States Senate. Yet with all this, when we consider the vast rapidly acquired fortunes that have been made in mining it is significant that mining millionaires do little for mining as mining, as a science in which scientific research might develop instrumentalities more powerful than would ever be found by private service, as a profession to be exalted in honor, and protected against the many forms of trickery which now harken upon it, as a brotherhood in which those who have failed of the main coarse thing, money getting for themselves, shall at least find a pension and hospital for their declining years. Many and rich are the beneficiaries of mining, but mining is a poorly endowed institution, the packhorse of greed left to perish where it can no longer carry.

Yet mining for its own sake is often an absorbing passion. It is worthy of being an objective point in itself without any measure of the value of the services given it that is commensurate with dollars. The story is told of an Eastern bridge builder whose friend called him to account because he made little money, while contractors on his bridge work amassed large fortunes. "The fact is," said the old man, "I don't make money; I make bridges." Yet had it not been for the drive of the money getting power it is probable that we would still be satisfied with old foggy bridges, and the Atahara bridge incident would not have given our British cousins one of the most significant of their alarms over American competition.

Yet I would like to see a miner who was first of all a man, and a finder of values without losing his dignity in them. Humboldt was an explorer and a massive grand figure. The prospector is an explorer, but he is likely to get weazened and "codgery," wizzled up amid desert sands, and frozen blue amid Arctic snows, a racked and tortured sacrifice of a man. The era of human sacrifices is by no means past, and a human sacrifice, though always a subject of religious consideration, is not usually to be commended, especially when it is a sacrifice to small motives and unfruitful folly.

If in sport there are finer issues than the animal murder, in mining there are finer issues than the degradation of men to money ownership. There is first the man himself inured to unusual hardihood, to long stretches of self-denial, to great fidelity of purpose. He is not a weak man. The multitude in the Scripture did not go out into the wilderness to see a reed shaken with the wind, nor a man clothed in soft raiment, not to see a courtier or a dude. They went out to see a prophet, a man of large stature, rougher apparel, living closer to nature's heart. What miner is not a prophet! Some may be false prophets cherishing illusions, but they have the great hope, and live upon it when the grubstake runs low. And they acquire daring to make great ventures, and fortitude to be good losers, and the patience of many Jobs, and the depth of long silence. When our affairs of State are played with by officers of fickle and shifty temper it may be worth while to hethink ourselves that mining educates men of steeper and more enduring purpose, men who pursue a valuable end patiently through discouragements and vicissitudes, men who shoot with a long how.

Besides the man, there are also the aims and the arena, and these are all that can be used to furnish any epic or heroic tale. The arena is hristling with aspects not yet seen, not yet made manifest. Its walls whisper secrets not yet heard, because the croak of gain has drowned them out in the "heavens above and the earth beneath and the waters underneath the earth." And the arms from pick and shovel have developed to great lengths of ingenuity

and complexity, and assume protean shapes in rendering violence, the power of the silent wire, and machinery which incessantly breathes that it may as incessantly strike.

All these multiform things so scantily outlined constitute finer issues legitimate to mining interest; craft and science and art and more than art, that are beyond the item of mere acquisitiveness.

Science fascinates, but there is something stronger. I was at a New York hotel whose corridors compassed the most of a block, and I heard a lady who had walked the length of them asked how far it was, and she answered in the words: "Half a mile by yourself, quarter of a mile with a man who can talk of science and art, and a furlong with a lover." That is after all the finest issue of mining, the affection for it though it be a hard master or prodigal rewarded, the loyalty, the patriotism, the pride of mining as a thing in itself so wrought into the spirit and associations of a man that he feels it his inalienable own.

Mine Valuation by Mining Experts.

There exists a very vague conception of what a mine really is, and an attempt to define a "mine" so as to distinguish it from a "prospect" or a "quarry" will at once make evident the truth of this statement.

Neither the geological origin of the mineral product nor the uses to which it may be put can be used as restrictive clauses or adjectives in the definition of the word "mine." Nor is the manner of working the deposit a criterion, for open-cut coal and iron mines are very common, while underground quarries are not unknown.

The distinguishing feature that marks the difference between a mine and a quarry is the comparative rarity of the respective products geologically considered. Salt, coal, leaf mica, iron ore, etc., are comparatively rare products, and, being such, may be spoken of as limited in volume. We think, therefore, that either the word limited or the word rare should enter into any exact definition of the term "mine" to differentiate it from "quarry."

Some clear distinction should also be made between the terms "mine" and "prospect," for so long as unexplored hodies of mineral are termed "mines," just so long will discredit and doubt attach to the mining business. We believe it, therefore, quite as essential to define the word "mine" as the term "ore in sight," and to use the word strictly as defined.

A "mine" may be defined as that part of a deposit of comparatively rare mineral which has been blocked out and explored by cuts, shafts, drifts, tunnels, inclines, or the like. If the mineral deposit has not thus been blocked out, it is a "prospect," and that part of a partially explored mineral deposit lying beyond the limits of the exploratory or development work is of prospective value, and should not be included as a part of the mine in estimating values; for no scientific valuation of a "prospect" is possible, and any attempt at such valuation is a mere guess.

The valuation of a mine, however, is probably easy of solution by a competent mining expert, so far as the elementary principles to be followed in the valuation are concerned. Of course, in the application of these principles, different experts will assign varying values to different quantities, and there may be large variations in the final results.

An example of these varying values was afforded in a paper read at the recent New Haven meeting of the American Institute of Mining Engineers by Dr. Rossiter W. Raymond, secretary of the society.

A certain copper mine had been estimated as having actually in sight sufficient ore to net \$2,000,000 a year for five years, and the owners of the property asked \$10,000,000 for it. Dr. Raymond's opinion was that the mine was actually worth not much more than half the price asked, even conceding the accuracy of the estimate of the ore in sight. In arriving at this conclusion, his reasoning was as follows:

It is axiomatic that a sinking fund should be established, and such a part of the earnings of the mine should annually be placed in this fund, that, compounded at the ordinary rate of interest on safe investments, say, 4%, the amount at the end of the life of the mine will equal the purchase price. Second, the life of the mine should be assumed as being no longer than it would take to mine the ore in sight, which in this case was five years. Third, that the net annual profits on the investment, after deducting the sum set aside for the amortization fund, should be figured at not less than 20%. When his clients suggest 10% as being a fair annual return on such an investment, Dr. Raymond's reply is always that 10% can be earned on perfectly safe investments in the West, such as county and city bonds and warrants.

While we agree with the general proposition that a mine expert's valuation should be on the conservative side, it seems to us that Dr. Raymond's claim of 20% as a fair return on capital invested in mining can hardly be accepted in these days of low interest rates. It is true that county and city securities bearing 8%

to 12% can be bought at par in some parts of the West, but only in very limited amounts, and they usually mature within a few months, or even weeks, necessitating the constant presence of a local agent to attend to presenting the paper for redemption and to the reinvestment of the freed capital. To make the matter even worse, the paper usually carries on its face no date of maturity, but when funds sufficient to redeem it are in the treasury it is called in by a notice in the local newspaper, and after being so called in it ceases to bear interest. Should the paper by chance run several years, the interest is not paid until its maturity anyway, then being figured as simple and not as compound interest. It is evident, therefore, in view of these considerations, that after deducting the commission of the local agents a large investor will have little more than say, 6% net earnings from his capital even on 10% securities. There is, besides, the further fact to be considered that the total sum which could be so invested will be found to be a surprisingly small one. When Eastern capital invested in the West receives more than 4% to 6% it is because of two added factors; first the managerial item, second the item of risk. We have seen how the managerial item enters into the interest rates on Western collateral of the kind in question, and a brief consideration of this subject makes it also clear that the smaller the investment of capital in business the greater the relative cost of this very item—the cost of management. It frequently takes very little more time of a manager to look after an investment of \$1,000,000 than one of \$50,000. The smaller investment, however, would have to earn a nominal 10% to leave a net 5% if the manager received \$2500 a year as salary, while the larger million dollar investment by earning only 6% would still leave a net 5% after paying the manager \$10,000 in commission or salary. Much more might he said on the subject, but it is hardly worth while, for in the great majority of cases it is not the province of the expert to tell his client what he ought to expect as interest on his capital. The capitalist's experience in such matters, as a rule, qualifies him to be more of an expert than the "expert," and—he it said in a whisper—he doesn't care a fig for the engineer's expression of opinion further than his expert knowledge of mining qualifies him to speak.

Coming now to the element of risk in mining, we are upon grounds where the expert must be consulted. First let us ask what the elements of risk are, by which we mean the risk of the engineer's estimate being too low as regards the cost of production, or too high as regards the yield of the mines. The sources of error appear to be:

- (1) Error in estimating the number of tons of ore in sight.
- (2) Error in getting a fair average sample of the ore.
- (3) Error in estimating the costs of breaking down ore, hoisting, pumping, ventilating and timbering.
- (4) Error in estimating the rates of wages that must be paid.
- (5) Error in estimating the cost of milling and smelting and the accompanying losses of metal or mineral.
- (6) Error in estimating transportation cost.
- (7) Error in over-estimating the market price of the product, which is liable to fluctuations.

Since the mine is assumed to be a mine in the real sense of the term, the likelihood of committing serious error in (1) may be regarded as of no great importance if the mine valuer is of ordinary skill.

Error (2) in getting a fair sample of the ore is in some cases very slight, coal and iron for example; while there are classes of deposits where it is almost impossible to get a fair sample, as, for example, the pockety deposits of cinnabar in some California mines. Except in the case of the more precious minerals, we may say that large errors in the sampling are not probable; and even in the case of deposits of precious metal, it is very often possible to get a close estimate, as illustrated in the working of some of the large hydraulic placer mines. In any case the expert should make clear in his report the extent to which his estimate of the quality can be relied on.

The development work should have reduced to a minimum the liability of erring in estimating the cost of drainage, etc., so that error (3) is of little moment.

Wages, of course, are liable to fluctuate in every line of business. Labor unions may, it is true, force the price of labor up, but so long as labor unions do not commit the folly of restricting a man's output, or of fighting labor saving devices, it is quite certain that improved means of handling ores and treating them will offset any rise in wages. This statement is substantiated by the census statistics for coal and iron mining in the United States. Hence error (4) is practically eliminated.

The cost of concentrating and smelting an ore is, next to fair sampling, the most difficult part of the problem, since to ascertain the proper method of treatment may require much experimenting. The larger the investment to be made the more certain will be the accuracy in estimating this item, for where it would not pay to spend several thousand dollars in experimental work on an ore from a very small mine, it most assuredly would pay where the

mine is a large one; so that the larger the mine the more certain is it that the cost of production will be susceptible of accurate estimate.

The cost of transportation is far more likely to decrease than to increase, so if assumed at existing rates there is very little chance for error (6).

Finally, coming to error (7) it may be said that all products fluctuate from year to year, the products of the mines no more than the products of the factory or the mill. The price is simply dependent upon the relation of supply to demand, in the long run being the cost of production in the poorest mines operated, plus fair profits. Since it is impossible to foretell just what the relation of supply and demand will be, and since all manufacturing ventures are upon just the same footing as mining in this respect, we may say that the expert is justified in assuming existing prices, leaving it to the capitalist to decide what to allow for this element of risk.

From the above discussion it would appear that so far as the expert is concerned the liability to err will depend entirely upon the particular mine he is estimating. From which it follows as a corollary that any general statement, such as that made by Dr. Raymond, to the effect that capital in mining should always have at least 20% net profit to warrant its investment, is not justified.

Abundant capital is seeking investment in these days, not only in investments where safety is assured, but in investments of greater or less risk, provided only that the return is commensurate with the risk. If the mine valuer does his work well, there will be as much or more chance that the property will turn out better than his estimate as that it will fall below it. Of course such investments are not proper for savings banks or the trust funds of widows or orphans, but the capitalist accustomed to take risks is often willing to balance the risk of gain against the risk of loss. It is the duty of the competent mine expert to present both these risks fairly to his client and leave him to decide as to their acceptance.—Engineering News.

THE extensive use of electric power in the Rhodesian mines is significant of the future of electrical engineering in South Africa, says the "Electrical Engineer," London, especially where the water power is available and fuel is relatively scarce. The purposes to which electricity is put in the mining operations of that country may be shortly summarized under five heads—i. e., winding, haulage, pumping, ventilating and cutting. The whole of the apparatus is usually on the surface, and nothing probably would be gained by placing it underground, except for the hauling, pumping and cutting operations. The usual working E.M.F. is five volts for the generator, and 450 volts—allowing a drop of fifty volts in the cables—for the motors. This pressure is found to be suitable for the ordinary mines, and is well within the limits of direct-current drum-wound machines. Within the last year or two the claims of polyphase machinery have been strongly urged for mining work, and particularly in South Africa, and there is little doubt that for extensive mines, where the motors are at a considerable distance from generators, polyphase machines are the best. But for ordinary mines 500 volts has been found a convenient and safe pressure. Among the most recent schemes for the electrical equipment of mining properties in South Africa is the one in Rhodesia, which proposes to use polyphase currents. The scheme provides for the harnessing of the waters of the Maquaddi river, and is estimated to cost \$500,000, including construction of dam, conduit and power plant. The work will take about two and a half years to complete, by which time it is expected at least 1400 H. P. will be available. Both the electric power and lighting plants are to be on the three-phase system.

THE Lahmeyer Co., Frankfurt-on-Main, Germany, furnishes an example of an electric three-phase plant at their Zollverien colliery, at Catenberg, near Essen, entirely for pumping. The mine is over 1200 feet deep, the pump raises 673 gallons of water a total of 1350 feet. The generating plant consists of a flywheel, three-phase alternator driven by a vertical tandem-compound engine, the alternator furnishing 300 kilowatts at 1000 volts between phases. The current is conducted down the mine shaft by two concentric-armored cables, supported every 315 feet by iron cleats, wood lined. The motor is rated at 350 H. P., and is directly connected to the pump, running at sixty revolutions per minute. The pump is of the duplex, differential type, its plunges being 5 inches and 7 inches in diameter, with a stroke of 40 inches. The motor weighs thirty tons, and was taken down the mine in pieces, being put together and erected there. The diameter of the stator of the motor is 15 feet. The engine on the surface indicated 426 H. P. when the pump was raising its 673 gallons 1350 feet, giving an efficiency between the cylinder of the driving engine and the power actually expended in the water of 60%.

A LACUSTRINE deposit of gold occurs in gypsum at Lake Austin, Murchison, West Australia, where, in a conglomerate of metamorphosed rocks, diorite and quartz, cemented by gypsum and oxide of iron, has been found free gold from a color up to 28 dwts.

Smelting on Vancouver Island, B. C.

Written for the MINING AND SCIENTIFIC PRESS.

James Breen and H. C. Bellinger in December, 1901, made arrangements to build a smelter at Crofton, on Oshorne Bay, on the east coast of Vancouver Island and about 50 miles by water or 40 via the E. & N. Railway from Victoria.

Contracts were made with the management of the Lenora M. Co. for the entire product of the Lenora mine as a base for ore supply for a customs smelting plant having a capacity to treat 700 tons of ore per day.

Clearing in the forest for the smelter site adjoining

and general manager, H. C. Bellinger, assistant manager and metallurgist in charge.

The system of trackage connected with the narrow gauge railroad from the Lenora mine at Mount Sicker to the smelter site has been arranged with a view of handling all the materials as expeditiously and economically as possible. At a point about 1000 feet west from the smelter buildings this narrow gauge road branches in a Y shape. The northern branch has been built to and along the wharf, which is 750 feet long, and arranged with a ferry slip so that loaded cars can be transferred from a car ferry. The southern branch extends across the track scales, thence up a trestle over the receiving bins on the west side of the sampler, while another branch has been built over the delivery or furnace bins on the

The capacity of this sampling mill is 1000 tons of ore per day of twenty-four hours. The furnace building, 120x50 feet, is covered with corrugated iron; the floor of this building is 8 feet below the charging floor. Adjoining this building on the east is the converter building, 120x40 feet, the floor of which is about 8 feet lower than that of the furnace building; and on the same level with the floor of the converter building, and adjoining it on the east, is the copper house, from which the blister copper, the product of the converters, is shipped to the wharf on the track already referred to.

In the furnace building are three furnaces—one water jacket furnace of 350-ton capacity; one Garrettson furnace, in which it is proposed to experiment and attempt the performance of the operations of smelting and converting in the one furnace; this has also a capacity of 350 tons per day; and one 50-ton concentration cupola furnace.

The ore, with the necessary fluxes and coke, is fed into the furnaces from the charging floor, and the air blast is furnished by two blowers, supplying 150,000 cubic feet of air per minute, driven by an 18"x42" Corliss engine, so fitted that at any time it can be compounded with more power, if required. The smoke and waste gases from the furnaces pass through the downtakes to the dust chamber, which is constructed of brick, 200 feet long, 12 feet wide and 20 feet high. This is connected with an expansion chamber 40x20x20 feet, which communicates with the circular brick stack, the interior dimensions of which are 12 feet in diameter, 120 feet high.

The matte from the furnaces is converted in two converters, each having a capacity of fifty tons of matte per day. The handling of the converters and mould carriages is accomplished by hydraulic gear, the power for which is furnished by a large Smith-Vaile pump and accumulator located in the engine room, which is 60x60 feet, situated a short distance north from the furnace building, and in which are also installed the Corliss power engine, blowers, condenser of 1000 H. P. capacity, and dynamo for lighting the entire plant with electricity. Steam to run this machinery is brought from the boiler house, situated a short distance to

the north, a building 60x40 feet, in which are three 200 H. P. return tubular boilers.

Adjoining the boiler house on the east is a building arranged for machine shop, carpenter shop and blacksmith shop. The buildings throughout are of wood, covered with corrugated iron.

To the north from the boiler house, 200 feet distant, is the assay office, erected with especial attention to furnishing accommodations. Westerly from the assay office about 200 feet is the general office of the smelting company.

The smelter has its own water supply, the source of which is derived from a lake about 2 miles distant and 400 feet high, where a retaining dam has been constructed. The water is carried from this reservoir through a flume about 1 mile long, which discharges into two 100,000-gallon tanks at an altitude of about 200 feet above the smelter, whence it is piped through about 5000 feet of 8-inch main, which gives ample pressure for fire protection and other purposes. In addition to this water supply the company have acquired 1000 miners' inches of water in the Chemainus river, distant about 3 miles.

Death From 110 Volts, Alternating.

This is the first genuine case the writer has met with of death from a shock at 110 volts, alternating. The case recorded occurred in the Concordia mine, at Oberhausen, in Prussia. There is a service at the mine of 110 volts, alternating, at the generating station, which is transformed down to 200 volts for power and 110 volts for light. The lighting was by 16-candle incandescent lamps. A workman was engaged in attending to a particular lamp underground. The lamp was fed by a pair of wires one millimeter in diameter, covered with rubber, and with impregnated jute overall, and the wires leading to the lamp were coiled up in a spiral of three millimeters in diameter in the usual way, the spiral being further protected by a covering of rubber and cotton impregnated with compound. The reason why the man was killed does not seem to be at all clear. He was seen by two other workmen attending to the lamp as they passed him, and shortly after, on their return, he was calling out for them to turn off the current, he being then lying on the ground. The two workmen went to the machine house, which was about a quarter of a mile away, and instructed the attendant to switch the light off. The attendant did not appear to have understood. At any rate, on the return of the two workmen to the place where they had left their comrade, he was found to be dead. Autopsy showed that he was in good physical condition; the verdict, after a careful inquiry, was that he died from the 110-volt shock, alternating, and the authorities state that in their opinion it must be taken that the lowest pressure for alternating currents that can be

Northwestern Smelting & Refining Co.'s Plant, From the Sea—Crofton, Vancouver Island, B. C.

the townsite of Crofton was begun about the middle of December, 1901, and the sampling mill was started up about the middle of June, while the smelter was blown in about the middle of September. When it is considered that in addition to clearing the virgin forest during the winter season, that about 17,000 cubic yards of excavation had to be made in order to locate the dust chamber, furnace, converter and

east side of the sampling mills. Another branch has been built for a coke track from the wharf to a point beyond the furnace building. The rails for this have been laid in a space between the furnace bins and the dust bins. This track branches off from the main line from a point near the shore end of the wharf. Still another track has been built close to the shore line to connect the copper room with the shore end of the wharf. In order to facilitate the handling of both narrow and broad gauge cars this entire system of trackage is laid with three rails, and work of switching the cars from point to point is performed by the company's own "Sbay" locomotive.

After the loaded car has been weighed and the weight registered automatically by a modern device attached to the beam of the Fairbanks scales, if it contains ore it is switched on to the track over the receiving bins, of which there are six in number, each having a capacity of 300 tons, and the ore dumped into one or other of these bins. From the bins the ore is drawn through a gate worked by a lever into ore buggies and wheeled 30 feet to a crusher 20x15 inches, set in a pit in the foundation of the sampling mill. The crushed ore is then carried by a bucket elevator 85 feet to the top of the sampling mill, where it passes through the first sampler, and the portion cut out for sampling is fed into a smaller crusher, from which the sample passes to the roll, and finally after passing through three sets of rolls is deposited on the lowest floor of the sampling mill and taken to the assay office, where it is ground to pass through an 80-mesh screen, quartered, and the final sample for assaying taken. The bulk of the ore, after being carried to the top of the sampling mill by the first bucket elevator, passes through chutes into either the furnace bins or to the roast heap bin located on the north side of the sampler. If to the latter the ore is drawn out into tramcars, which run on a track level with the tops of the ore bins, and which extends to the west of the sampling mill, a short distance, and is so that the loaded trams can be discharged onto the pile of ore being built up for open roasting. If the ore is discharged into the furnace bins to be smelted raw, it is drawn through the gates worked by levers into ore huggies run onto a platform scale, where the charge is weighed; thence onto the charging floor of the furnace building, which is on the same level as the ground floor of the sampling mill and the platform over the roof of the dust chamber. There are eight furnace bins, each having a capacity of 300 tons. The distance between the gates of the furnace bins and the furnace is about 50 feet. A portion of the space is occupied by the coke track and the balance by the roof of the dust chamber. The two lines of bins extend from north to south parallel to each other with the sampling mill occupying the space between. The sampling mill is run by an independent engine installed in a room on the ground floor of the mill, and which receives its steam from the main boiler house.

Northwestern Smelting & Refining Co.'s Plant, Front View.

copper buildings to the best advantage, also the grading and laying a complete system of trackage as well as building wharf, ferry slip and the erection of the smelter plant itself, the time occupied has been very short, but would have been much shorter

Northwestern Smelting & Refining Co.'s Plant, Looking South.

had not the completion of the plant been delayed because of the tardiness of the machinery manufacturers in the United States in delivering the machinery, owing to strikes and lockouts.

The smelting company has been organized as the Northwestern S. & R. Co., James Breen, president

considered safe should be considerably reduced from previous ideas.

There are two possible causes in this case. One is that there was a partial connection between the primary and secondary service, and that the man who was killed got the benefit of a portion at least of the primary voltage. The other cause is evidently the time factor, which has been shown to have such an important effect in these cases. In the writer's opinion, it is perfectly possible to kill by a pressure of only 110 volts, continuous current, if you take sufficient time. If the Chinese ever want some new kind of excruciating torture, the recommendation might be made to them to try tying a man to a 110-volt service, making good connection, and leaving him there until he hands in his checks. It would be a brutal method, but probably not more so than some of their existing methods. Anyone who has tried the experiment of taking hold of terminals in connection with a 100-volt service will know that at first, and for some little time, nothing is felt, then gradually a sense of heat develops, which increases, and, if hold is continued, pain commences, and gets sharper and sharper.

In the present instance it is not stated how long the victim had been in connection with the service when the other workmen saw him lying on the floor. It would take them some little time to go a quarter of a mile on mine roads, which are very heavy for walking, and it was stated that the order to turn off the light was not understood, as the lamp was still burning when the men returned to it. So that it is probable that the victim was in connection with the service for something like half an hour. It must be remembered that with alternate currents the pressure which operates upon the human body to give shocks is the top pressure of the alternation. That is to say, with a 110-volt service the acting pressure on each side of the alternation would be 110×1.41 volts, or 155 volts. In addition to this, since the alternations follow each other at intervals of a small fraction of a second, the double maximum pressure will be felt in the shock. The nerve will be subject first to the maximum pressure in one direction, and immediately after to the maximum pressure in the opposite direction. So the shock would be due to 310 volts in this case, plus any induction that might arise. And this is not all. The above refers to shock alone. But after the shock had contracted the muscles and prevented the victim from losing his hold, a current would pour through the body, and this current will be that due to 110 volts; but, being an alternating current, it will not be subject to such a high induced back pressure within the body itself, as a continuous current would from the motion of the fluids in the blood vessels in opposite directions.—S. F. Walker, in *Electrical Review*.

Two Suggestions.

TO THE EDITOR:—In the overflow of "Concentrates," on page 219 of the issue of October 18, regarding that brassy copper plate I have had something to do, and on a recent visit to a small quartz mill found there was trouble, the plates being exactly as described in your correspondence. Inquiry showed that everything that a man having some little knowledge of chemistry or metallurgy could be expected to do had been done. I asked the millman to stop the mill, wash the plate, and bring a lump of cyanide. When the plate was washed, with the cyanide in one hand and a silver piece in the other, on a small spot near the head I rubbed alternately with the silver and cyanide. In a few minutes the spot thus rubbed became bright. Other hands then took hold, and within a short time that plate was brought into good working order, and it was kept so until a new plate was put in its place. Dry chloride of silver, pulverized cyanide of potassium, and crushed quartz sifted through a 100-mesh sieve, mixed together, and rubbed on dry at first, then just enough water to make a paste, using cork as a rubber, will generally cure a sick plate. Mix a trial lot and get the best proportion for each case.*

In "Colorimetric Estimation of Gold" "Concentrates" gives chloride of tin as a final test for the presence of gold, but I have good reason to doubt this long-established standard as reliable in all cases.

Wanting a quantity of purple of cassius, I put some native gold in nitro-hydrochloric acid, obtaining a saturated solution of metals present. Diluted in water, and adding chloride of tin solution, there was no visible effect; more tin solution was added without change in appearance. I added aqua ammonia and shook well; this produced no visible change. I then kept on adding ammonia, drop by drop, in the same spot, until a slight turbidity appeared, for an instant only; then a larger quantity of ammonia was added, and a dense yellow-white precipitate was formed. This precipitate was dried. A very small portion was put on charcoal and heated. No sign of fulminate being found, the precipitate was collected in a lead foil dish, scorified and cupelled, yielding a normal gold button. A second solution was made as before, and metallic tin suspended in it for several days gave not the slightest color.

Jacksonville, Oregon.

JOS. VOYLE.

*The less cyanide on a plate the better, for the remedy is worse than the evil it is intended to cure. Continued use in the manner indicated will tend to make the plates so hard that the mercury will not adhere to them, but tend to gather in globules and disappear with the pulp passing over them.—Edison.

Mining and Metallurgical Patents.

Patents Issued October 28, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

BUFFER DEVICE FOR ROCK DRILLS.—No. 711,998; R. B. McConney, Denver, Colo., assignor to the Mine & Smelter Supply Co., Denver, Colo.

In recoil huffer device for rock drilling engines, combination with casing, crank arm and drill holder, of an abutment collar mounted on drill holder, sleeve mounted on drill holder hearing at one end against abutment collar, means for securing sleeve on drill holder and for holding sleeve against collar, fixed collar extending transversely across casing, axial bore in collar surrounding loosely sleeve, second transverse abutment in casing adjacent to drill holder abutment collar arranged to allow drill holder collar to pass it during reciprocating action of drill holder, washer loosely mounted on sleeve adjacent to second named abutment and compressive coiled spring mounted loosely on sleeve arranged under slight expansive tension between first named collar abutment of casing and washer, whereby washer is held against casing's second named abutment in path of recoil movement of drill holder's abutment collar.

SUBMARINE ROCK DRILLING AND BLASTING APPARATUS.—No. 712,002; R. J. Packard, Morristown, N. J.

Submarine drill mechanism, tube, means to support same in suitable position resting on bottom in combination with drill, a guide sleeve run on drill shaft, sleeve having conical edge and of size to wedge centrally in drilled hole, also longitudinally corrugated, pipe passing through one corrugation, by means of which water may be forced to drilling point and out of drilled hole through other corrugations, tube being also provided with apertures above mud line, out of which water thus forced in may escape and carry therewith particles of rock as same are broken by drill.

FURNACE BLOWER.—No. 712,235; H. R. Arthur, Longmont, Colo.

Combination of cooling chamber having perforated top, condensing chamber concentrically disposed in cooling chamber projected upwardly through top of latter, lower end of condensing chamber being above bottom of cooling chamber, foraminous cap fitted over projecting extremity of condensing chamber, steam-injecting nozzle extending upwardly from bottom of cooling chamber into condensing chamber, having steam supply pipe connected thereto, drip pipe eccentrically attached to bottom of cooling chamber.

DRIER FOR ORES.—No. 712,258; A. G. Campbell, Sherbrooke, Canada.

In mechanical drying apparatus, series of imperforate, open-ended cylinders arranged in parallelism about common inclined longitudinal axis of rotation, circular heads having openings to receive ends of cylinders, to which they are secured, heating chamber inclosing cylinders, having end openings closed by heads, means to rotatably support group of cylinders, feed hood inclosing open inlet ends of cylinders, to direct thereinto material to be treated, intumed segmental retaining lip at inlet end of each cylinder, located on portion of circumference of cylinder nearer common axis of rotation.

SMELTING FURNACE.—No. 712,374; W. F. Hannes, Deming, N. M.

In furnace, partition extending from upper part thereof part way toward bottom, whereby fuel compartment, having communication at lower end with body portion of furnace, is formed, means for supplying fuel to fuel compartment, means for supplying ore to body portion, valve-controlled tuyeres for supplying oxygen to fuel below compartment, independently controllable means for supplying oxygen to ore in body portion above level of first named oxygen supply.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The September return of the Alaska-Treadwell mine was as follows: The 220-stamp mill ran 30½ days; the 300-stamp mill ran 30½ days, crushed 87,708 tons; estimated realizable value of hullion, \$84,477; saved 1745 tons sulphurets; estimated realizable value of same, \$82,983. Working expenses for month, \$68,609.

President Roosevelt, in his annual message to Congress, will devote a paragraph urging better mining laws and provisions governing public lands in Alaska.

ARIZONA.

COCHISE COUNTY.

At Douglas Superintendent I. L. Merrill expects the Calumet smelters will blow in next week.

GILA COUNTY.

The Globe Silver Belt says the Old Dominion mine resumes operations at the rate of 800,000 pounds of copper per month, with a saving in the cost of 1½ cent per pound—by reason of reduced freight rates—compared with the cost at the time the mine was shut down, September 12.

The Black Warrior Copper Co., Amalgamated, has resumed at the mine and leaching works. Four new leaching vats are to be constructed, also a blast furnace for the reduction of slag from the refining furnace and ores not adapted to leaching.

GRAHAM COUNTY.

A. P. Ayling, president New England Copper Co., Clifton, Arizona, tells the El Paso Herald that the Arizona Co., a Scotch syndicate, is averaging about 45 tons of refined copper per day, or from 1200 to 1400 tons per month. It is putting in new machinery and is operating its five large furnaces that replaced the old ones. This company has been very successful. The Detroit Copper Co. (Phelps-Dodge people) are turning out about half what the Arizona Copper Co. is. It is also putting in new machinery.

The New England Copper Co. has done about 4500 feet of development work within the past year 3 miles from Clifton, where there are fissure veins distinct from the blanket formations of the other parts of the district. The rock is hard and has not been leached out. They are operating six electric drills. He expects to put in a smelter—small at first, probably a 200-ton plant—just as soon as is determined the best method of treating the ores. The company owns twenty-two claims and most of the work has been done on the Copper Bullion and Solid Copper claims, on the same vein. There are two shafts down about 600 feet each. Two tunnels cut these shafts at the 200 and 450-foot levels. The lower tunnel, which has been started recently, crosscuts from the Monte Carlo claim, about 600 feet, and then will run in on the vein of the two first mentioned claims and will strike the two shafts spoken of on the 1000-foot level. This tunnel will be about 3500 feet long. The company has been fortunate in striking good ore. The pay-streak is running about 5 to 6 feet of copper glance and is now yielding ore that contains \$1000 to \$1200 in values per day. For every dollar put into the work there is \$2 worth of ore on the dump from the development alone. No ore has been shipped and it is all piled on the dump. On both sides of the New England Co.'s property the Clifton Con. Co., of which L. A. Dunham is general manager, is pushing ahead.

The train over the 22-inch railroad from Longfellow to Metcalf is superseded by the new 36-inch narrow gauge railroad. The "baby gauge" was built in the early '70s, the first railroad ever built in Arizona.

The Era says the development work done in the Coronado M. Co.'s properties shows favorably. The tunnel has been continuously in ore, lowest assay 8.4% copper.

MARICOPA COUNTY.

At Phoenix last week were incorporated Mesquite Springs Gold Co., B. A. Stevens, A. F. Blank of Los Angeles; Timber Lake M. Co., J. Goodie, W. F. Church, I. J. Ordway of Colorado; Tres Mines M. Co., J. Ashcroft, C. K. Hill, J. M. Wyatt.

MOHAVE COUNTY.

The Miner says there are 100 men on the Gold Royal payroll. More men are being put on.—The Elkhart Co. is at work on the new plant.—The Minnesota-Connor is shipping rich ore.—Men will be put on the Queen Bee mine at Mineral Park.—The Tennessee mill is running, but work may be interfered with by

the non-arrival of fuel oil. Scarcity of cars in the oil districts makes transportation slow.

C. A. Ellis is experimenting with the ores of the Gold Basin country, and finds that they are susceptible to cyanide treatment.

Superintendent Barry is preparing for extensive work on the Gold Nugget mine at Cerbat.

Carl F. Shader, general manager of the German-American M. Co., has closed a contract for the sale of the company's property to W. Bayley of Los Angeles for \$50,000. The property of the German-American M. Co. is in San Francisco mining district, 19 miles northeast of Needles, Cal., 27 miles northwest of Kingman, comprising fourteen claims.

PINAL COUNTY.

Near Florence the bottom of the Alice shaft is reported in solid iron, thought to be a spur from the main ledge, as the main ledge is to the south and in the foot wall on the side of the shaft. The flow of water in the shaft amounts to 54,000 gallons in twenty-four hours.

YAVAPAI COUNTY.

Colorado and Boston men will work the Planet copper mine on Bill Williams Fork of the Colorado river. A wagon road will be built to the Santa Fe Railroad and a 50-ton smelter built in addition to the old 30-ton smelter of the old Matilda Co. The mine is said to consist of six large parallel veins ranging from 60 to 120 feet in width.

At Jerome, part of the tramway above the smelter will be taken to the Iron King to be used there to tram from the mine to the smelter to be built to work the ore from that mine.

YUMA COUNTY.

At Quartzite, J. A. Rivers, superintendent Success Copper M. Co., has men grading for a hoist. The company contemplates erection of a smelting plant.

CALIFORNIA.

ALAMEDA COUNTY.

The Tesla Railroad is to be extended to San Francisco.

ALPINE COUNTY.

At Blue Lakes the work in progress there will be not completed for some time; it includes several dams, some of them 80 feet in height, constructed of solid masonry, and involves an expenditure of \$1,000,000. The ultimate object of this work is to supply San Francisco and interior towns in California with electric light and power. The company employs every man who applies at \$1.75 per day; when the price of board is deducted, it leaves him about \$1.15 per day for his labor.

AMADOR COUNTY.

The Ledger says at the Zella the hoisting of rock is suspended to repair the shaft.

The Horn mine, near the Defender, will connect with the 80-foot shaft when taking out ore for milling will begin. The ore body is reported 6 feet wide and runs from the tunnel level to the surface.

BUTTE COUNTY.

The Butte & Plumas Railway Co. has incorporated at Oroville to construct and operate a railroad, standard or narrow gauge, from Oroville to the junction of the North Fork of Feather river and its east branch; estimated length of road, 55 miles; H. H. Yard, E. H. Benjamin, A. M. Hunt, A. Ekman and C. Gray; capital stock, \$1,000,000—\$65,000 actually subscribed.

FRESNO COUNTY.

A new gas plant has been established, for the manufacture of gas solely from crude petroleum, at Fresno. The heavy fuel oil is pumped from a tank directly into generators.

KERN COUNTY.

At the Dean & Jones mining operations at Arondo, between Ballarat and Johannesburg, the ledge is 120 to 150 feet wide; the assay value does not exceed \$6 per ton. The ore is quarried out and run through Cornish rolls and taken to cyanide tanks for treatment; assays of the tailings show a loss of not over 10 cents per ton. The company has twelve tanks on the ground. A tramway is projected. The number of tanks is to be increased to give capacity for working 200 tons of ore every twenty-four hours.

At Ballarat the Miner reports the Golden Argus has fifteen men at work and will start the 5-stamp mill. Superintendent J. C. Cress will put men at work on his own property.

At the Ratcliff mine, in the Panamint range, there are about thirty men at work and a 20-stamp mill running night and day. In Old Panamint T. N. Stebbins has men at work on the Curran mine. J. P. Flint is putting in a cyanide plant in Tuba canyon, the property of the Inyo Gold Co.

In Keysville shafts are being sunk on the Lady Bell and Big Blue mines; work

is also being done on the Mammoth and Capital mines.

Work is going ahead on the canal for the Electric Power & Development Co. The company is importing many Japanese for the rough work. Mojave Indians were employed for some time, but drop out, as the work is too hard for them. There are 300 men working on the canal. The company is paying generally \$2 a day for top work, for surface blasting \$2.50 and for tunnel work \$3.

LOS ANGELES COUNTY.

Iron ore 3½% titanium is reported by the American Iron Co. at Russ Station, in the Soledad, near Saugus. The manager says the ledge is 800 feet above the company's smelter at Russ Station, with gravity haul. The first run of the plant has already produced a number of pigs of good-looking iron. Oil and charcoal are used for firing the smelter. The lime rock comes from Tehachapi and costs \$3 a ton, laid down.

NEVADA COUNTY.

Work on the Brunswick mine has resumed.

At the Conlin mine Superintendent O'Connor has cleared the old tunnel leading into the Lafayette mine. Where the entire works were destroyed by fire new buildings have been completed. The hoist and pumps will be in operation next week. At present the company will not build a mill.

L. R. Poundstone is manager and J. L. Gluyas foreman of the California, or Gaston Ridge, mine, between Washington and Graniteville, altitude about 5000 feet. A tunnel is in 2800 feet. The 8-foot ledge is low grade. Everything mined is crushed in the 30-stamp mill; capacity, 150 tons per day. Motor power is furnished under a pressure of over 300 feet. The mine employs fifty men.

Superintendent A. D. Gassaway, at the Union blue gravel mine, North Bloomfield, for thirteen months has been driving a tunnel to reach the channel; it is now in over 5000 feet. A small locomotive is used for hauling the rock and earth from the tunnel. About fifty men are employed.

Superintendent Ralston, at the Gold Blossom mine, will put in a pumping plant. A 10-stamp mill, hoist and other machinery will be installed.

The Gold Tunnel M. Co. have their stamp mill completed and report it doing good work.

F. Enzensperger says the Red Cross mill will be ready to operate Jan. 1.

SAN BERNARDINO COUNTY.

C. H. Thompson and the estate of A. G. Campbell have given an option on the Brick Con. group of mines, near Vanderbilt, to the Federal G. M. Co., which will require \$720,000 for the purchase and development of the properties.

SHASTA COUNTY.

Hartwig A. Cohen, general manager of the De Lamar interests, tells the Salt Lake Tribune that the sale of the Bully Hill has not been completed, but that everything is favorable to it under the option which was recently granted by the owner.

The Redding G. & C. Co. has bonded the R. B. Read and Oliver LaPlant properties at Keswick. The Read property consists of two mines—the Gold Quartz and the Dipper—both producing properties; price \$10,000. The LaPlant property is the Clary mine and Cascade Nos. 1, 2 and 3. Men will put in a hoisting plant; a 350-foot shaft will be sunk on the Read mine.

B. F. Rodgers, superintendent South Fork mine, has men cutting 45 feet of tunnel a week and is nearing the main tunnel.

Superintendent W. W. Adams will resume work on the Balaklala mine this week.

TUOLUMNE COUNTY.

(Special Correspondence).—At the Lost Fox mine, 20 miles above Carters, the new 20-stamp mill is completed and within ten days Superintendent Ingalls expects to be crushing rock. Steam power will be used at present, but a 6-mile ditch is planned by which water will be brought from Bear creek, giving a fall of 800 feet, and a continuous supply the year round. The shaft is down 200 feet, and at this depth there is a 7-foot ledge of good ore. Thirty men are employed. The mill at the Hunter mine is in operation.

Sonora, Nov. 3.

A strike is reported in the 560 level of the Confidence mine in an upraise.

The Columbia Marble Co. have a 60 H. P. traction engine. There are in addition to the engine three freight wagons of ten tons capacity each, also one oil and one water wagon.

At the Harvard mine No. 1 shaft is timbered 650 feet down; the 700 level will be reached next week, when sinking will be continued.

TRINITY COUNTY.

Superintendent Porter of the Fairview mine, near Minersville, tells the Journal

that the new 10-stamp mill has been started up and works well. The tramway conveys enough ore in an hour to feed the mill for a day, each car having a capacity of 1000 pounds. The ledge is strong, well defined and rich in free gold. The property is a valuable one and improves as work progresses. About sixty men are employed.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—The B. & M. mine at Ward is being worked by lessees. Last month they shipped thirty-two tons of ore, averaging \$50 per ton, and will soon ship a carload per week. The mine has a 10x10 hoist and 6 drill compressor. The shaft is down 900 feet. Ten men are working. Contractors are building a shaft on the B. & M. lead No. 2 to develop it and adjacent properties.

The Newmarket mine at Ward is doing development work at present, driving west at the 500-foot level for the croppings of a big ore shoot. The mine is not shipping at present. The incline shaft is on a pitch of 19° down 505 feet, with levels 150, 250, 300, 400 and 500 feet. Smelting ore runs from \$10 to \$150 per ton. Milling ore \$7 to \$12. A 10-stamp mill is connected with this mine. The Quickleyville mill water power runs the mill eight months in the year. The mill has the record of making good saving. G. A. Kilne is the owner and manager of the mine. Next month, when development work is finished, he will put on more men and start shipping ore.

The Oronogo G. M. & M. Co. at Ward, W. E. Meade manager, is building a shaft house and putting in a 60 H. P. steam hoist, boiler and air compressor to sink a shaft 1000 feet deep. They have six claims 1 mile from town on Oronogo hill, and have developed three veins on the property and will sink two of them. They will sink one shaft at the east end and one at the west end of the property and connect the two at the bottom, which will develop the hill and give ventilation.

The Giles G. M. & M. Co. in Spring gulch, Ward, are carrying on development work at its 500-foot level, drifting toward a chimney of ore 300 feet wide showing small veins of gold bearing ore. On the surface this chimney shows good cyanide and free milling ore. They are unwatering a shaft sunk on the property by the former owner. This company has thirty acres in one body.

The New Morning Star M. Co. in Spring gulch, Ward, J. E. Lee superintendent, have a bond and lease on the property. The have four claims—Morning Star, Emma Lena, Evening Star and New Morning Star. There are several leases at work on this property. Last month they shipped thirty-six tons of mill dirt and smelting ore. The smelting ore averaged 5 ounces in gold and mill dirt \$15 per ton. The company is doing development work exclusively. They are figuring on putting in a new compressor. They have the main shaft down 300 feet and are sinking with steam drills. They have two shaft houses and two hoisters on the property.

Ward, Nov. 1.

(Special Correspondence).—Andregg, Bean, Hubbard & Hendricks have a lease on the Wood Mountain mine and mill at Wallstreet and are handling from twenty to twenty-five tons of ore per day through the mill. During the month of October they were drifting in the mine, but kept the mill running steadily. They are taking ore from the winze. The milling ore, which is from 5 feet to 15 feet wide, will average \$10 per ton. They have small streaks that will run as high as \$60 to the pound. The mill is concentration and amalgamation. On account of the scarcity of water they are only running the water wheel at night to supply the mine with air.

George A. Blaisdell, manager the Gold Lode mine at Wallstreet, is working two shifts sinking the shaft down to 500 feet. It is now down 300 feet. Putting an upraise through from the 100-foot level which will give them good circulation. Has two bodies of ore. The main body is about 26 inches wide and runs from \$22 to \$24 in carload lots. Has a high-grade streak that will go from \$160 to \$230 per ton. Has the mine equipped with a 6x8 hoist and 30 H. P. boiler.

At present the Lucky Star mine at Wallstreet is doing development only. The shaft is down 425 feet.

The Nancy G. M. & T. Co. at Wallstreet have their tunnel in about 1250 feet. At a distance of 1050 feet they struck the Gillard vein. They are now upraising in the breast of that level to connect with the shaft on the hill. They are now within a few feet of making connections. Are shipping about two car loads of smelting ore per month, but the main body of the ore they are now taking out is milling ore which they are piling up waiting for the completion of the mill at Wallstreet.

The vein they are at present working on is called gray copper. They have about 400 feet of stope just completed and are ready to take out ore. Are starting a stope on the Last Chance vein. Are sinking on the Gillard shaft. Have between 400 and 500 tons of ore on the dump waiting for the mill to start up. Milling ore runs about \$15 per ton, smelting ore about \$50 per ton. They expect to build a short tramway from the mine to the mill later on. S. G. Knott is superintendent, W. M. Mitchell, foreman.

Ralph Cotton, manager of the Hidden Treasure mine, Wallstreet, is sinking a shaft 100 feet and will run levels from this point. Everything is looking favorable for a good mine, and if same turns out according to expectations they will install a hoist and other machinery necessary for the operation of the mine.

The Old Wallstreet tunnel at Wallstreet has just been started up by the Mile High M. & M. Co. of Denver, composed of mail carriers. The tunnel is in 400 feet. They expect to run same to cut the Tomboy lead, which is about 200 feet more. A. J. Matt has charge of the work.

At Sugar Loaf, where they grow gold in potato patches, I interviewed W. B. Teters, who stated: "The width of the ore vein is from 6 to 8 feet. Shipping ore runs from \$15 to \$10,000. We shipped some without sorting that run 300 ounces in gold. By the car load it has run eight or nine ounces in gold without sorting the bulk ore. Up 1500 feet on the same vein we cleaned out an old crosscut on the Sphinx and took samples. The samples run as follows: No. 1, \$39.60; No. 2, \$70; No. 4, \$488.96 per ton. We went 30 feet west of that, cut a vein and got a sample that run \$11.60. The vein is 43 feet wide that runs from \$11 to \$500 per ton. In places the ore was taken out 28 feet wide. There is a shaft down 200 feet and assays taken all the way down shows ore." They are taking out the rich ore on the side of a hill, a trench about 30 feet deep by 15 feet wide and probably 12 feet long; they also have a shaft down a few feet where they are taking out the best ore. The ore taken out from the trench is milling ore. The flod mentioned above is on the ground belonging to the Livingstone, a short distance from the main shaft of the Livingstone, and was discovered by a man while plowing a few weeks ago.

J. G. Wood of Salina has a lease on No. 3 of the Little Johnnie group and is taking out some very fine ore—some running as high as \$10 per pound. The tunnel is in 425 feet. The ore he is taking out is about 100 feet from the breast of the crosscut. The streak of ore is from 6 to 8 inches in width.

Wallstreet, Nov. 5.

(Special Correspondence.)—The Tripp Reduction Co., Ward, on the Sao Blas property, is overhauling the mill. The Tripp process will be used. Part of the ore is free millage. They have a 20-foot vein averaging \$5 per ton; are crosscutting for high-grade vein and expect to strike it at 300 feet depth. Dr. Dillingham is superintendent.

The Boston mill at Puzzler, Ward mining district, is being operated by P. H. Shue & Co. They have a centrifugal slimer. The treatment is different from ordinary. Following the plates or battery first is a classifier, which separates the heavy pulp from the water containing the slimes. The pulp is taken through the usual table process, the water of the pulp run through the centrifugal slimer, a percentage of the higher gravity slimes taken out. In cutting out these slimes in such a quantity of water they conform to the usual concentration and chemical process. The mill contains forty stamps, but they will use but twenty stamps. The system which they will employ will increase the table capacity.

The Ward Rose M. Co. at Puzzler, Puzzler gulch, will sink 500 feet below the tunnel level, now 430 feet, by contract. The mine has a good shaft house, tunnel house below, a 10x12 hoist, two 40 H. P. boilers, three-drill compressor; do all of their work with machioe drills except stoping. The ore averages five to eight ounces in gold. They have no use for a mill as their ore is mostly a smelting ore; have twenty-two claims, two mill sites. All of the twenty-two claims can be worked through the tunnel. A. R. Donaldson is manager.

The Success group of claims on Saw Mill hill at Puzzler is owned by W. M. Coleman, who is putting the property in shape for operation. There has been about \$16,000 expended on the claims in the way of improvement. He has two leads opened up which shows ore that will run \$30.

Camp Brainard at Ward shows a fine stone power house 40x30 feet, containing 125 H. P. dynamo, Westinghouse type, four 38-inch Leffel water wheels, four-drill compound compressor. The compressor is made to run with either steam or water, or both together. The power plant furnishes electric lights for the

mioes, boardiing-house and residence. W. Brainard is manager. They are only operating in the Alaska tunnel at present, now in 2000 feet.

Suonet, Nov. 1.

The Nancy Co. projects an electric tramway from and through the Nancy tunnel to the ore bins of the Wall Street G. E. Co., a distance of 3000 feet.

CHAFFEE COUNTY.

A. Tetrault of Turret has a new stamp mill, 1000-pound stamps dropping at the rates of 100 times per minute.—The new machinery for the Vivandiere mioe at Turret is being set up. Sinking below the 500-foot level is resumed. The old machioery will be set up at the Gertie.

The Washington mioe at Granite has been closed down for a short time, but is expected to begin again November 15. The company will hoist ore to be treated at the Magenta mill.

The St. Joseph M. & M. Co., recently acquired by the Colorado Sureties Co. and owning property adjoining the Washington, is preparing for extensive development work.

CLEAR CREEK COUNTY.

The Clear Creek M. & Dredging Co. will resume placer mining near Idaho Springs upon a considerable scale.

Near Silver Plume an ore shoot on the Seven-Thirty & Bismarck group, in the west drift on the tunnel level, assays 250 ounces silver and 1½ ounce gold.

Louisini & Co., lessees on the Pelican Dives, during the past week shipped one wagon load which gave a mill return of \$3027 and another which brought \$1000.

J. H. Robeson, going westward in both drifts on the Burleigh tunnel, has medium grade ore in the Phillips lode.

In the Seaton mine Manager Goldsmith reports 8 feet of pay ore in the ninth level on both sides of the shaft winze. The raise put through from ninth to eighth has also opened up a solid streak of smelting ore 4 feet wide and running \$60 a ton.

L. Bonham, general manager Pontiac G. M. Co., will develop a tunnel site and other claims in the East Argentine district. The company will run a tunnel 4000 feet through McClellan mountain.

Idaho Springs reports a deal in Lower Clear Creek, where the Con. Gem M. Co. buys 2 miles of vein within the Newhouse tunnel. W. E. Renshaw, one of the owners of the Gem mine, interested Eastern capital, with the result that almost \$3,000,000 changes hands. In the group turn-over was the Franklin and Silver H. groups, recently consolidated, and belonging to the Franklin Con. Co.; also, the Freighters' Friend, belonging to W. E. Renshaw. In all, over 100 claims were included in the consolidation. In addition to the working mines, with their compressors and plants, several mills were included; among these were the Newton concentrator, capacity 100 tons per day; the State ore mill, opposite the Newton, and the Silver H. mill, below Idaho Springs. An interest was also acquired in the Seaton Mountain E. L. H. & P. Co., which owns two plots—one in Idaho Springs, the other 3 miles below; also, several miles of water rights on Clear Creek.

The Pontiac G. M. & T. Co. is incorporated to drive a tunnel through McClellan mountain, in Argentine district, 3500 feet in length, beginning on the eastern slope and driving through toward Grey's peak.

Manager Marshall, of the Marshall-Russell Co., at Marshall park, in a 400-foot tunnel, has cut the seventh vein and the sixth blind lode. A new vein shows 3 feet of \$8 sulphide ore, with 8 feet of quartz. A steam plant will probably be installed as an auxiliary of the water power.

GILPIN COUNTY.

The Ingalls G. M. & L. Co. has incorporated; W. R. Benzie, W. H. Haven, J. M. Sbrote, P. E. Richter, J. E. Hunter. The company is operating the Ingalls mine, Quartz hill, and arrangements are being made to sink the shaft a further depth of 200 feet.

During the third week of October the shipments of smelting and crude ore, tailings and concentrates from the Black Hawk depot to the Golden and Denver smelters and to Idaho Springs points were 101 cars, or 1020 tons, bringing the total for the month to that date to 309 cars, or 6180 tons.

A new cable 1500 feet in length has been received for the Delmoioe property on Quartz hill. Sinking is being carried on with three shifts. The shaft has about reached the 1000-foot depth, but will continue to 1400 feet. There is good ore showing in the shaft as well as in the 800-foot level.

At the Alps mine in Nevada district stoping and upraising are being carried on between the fourth and fifth levels and enough millage ore is being hoisted to keep one battery of stamps dropping at the Gilpin mill at Black Hawk. The les-

sees are also taking out smelting ore which will run from five to six ounces gold per ton, and employment is being furnished to fifteen men, with double shifts.

The Golden smelter, operated by the Clear Creek M. & R. Co., has taken off from its smelting charges the penalty for silica on all ore not running over \$15 per ton, the charges to remain the same for excess silica on all ore above that value.

Denver men have a lease and bond on the Straub mine on Gunnell hill and have commenced sinking.

Near Central City, the Kansas-Burroughs Con. M. Co. will sink their Phoenix-Burroughs shaft another 100 feet, which will give it over 1400 feet depth.

GUNNISON COUNTY.

Superintendent R. W. Spensley of the Dora has been doing extensive work in Union park, in the Tin Cup district, of a preparatory nature. Besides this, a ditch of 3 miles has been made to secure water for hydraulic pressure, furnishing a fall of 120 feet. This season the last 400 feet of flume work was completed. A half mile of solid bedrock had to be blasted out in coming up Loties canyon with the flume.

LAKE COUNTY.

Leadville reports that the new shaft of the Boulder M. Co., in Big Evans gulch, north of the Big Six, has shown improvement. At a depth of 170 feet it was decided to commence drifting, and a fissure has been cut which gives assays of one-half ounce in gold.

The Moyer is shipping 100 tons per day of zinc ore, most of which is obtained by hand sorting. The material is now being shipped to the Lanyon Co.'s works at Gas, Kan.

At Sugar Loaf the Orinoco, Gunnison and Fanchon are all taking out mineral.

T. S. Wood of the Greenback mine states that thus far the owners have not made any contract for their ore, but that there is a possibility of an arrangement being made, whereby the property can resume. As to the value of the Greenback ore to the lead smelters, it is a clean iron sulphide. Extensive developments at various levels have demonstrated the existence of ore reserves sufficient, Mr. Wood states, to keep a smelter running for twenty years.

In the Progressive shaft on the O. K., Manager Cooper has data furnished by the shaft which shows conditions as follows: Wash, 30 feet; lake beds, 75 feet; soft coarse-grained gray porphyry, 45 feet; white talc, 4 feet; soft coarse-grained porphyry, 13 feet; yellow talc, 3 feet; soft gray porphyry, 23 feet; hard white porphyry, 14 feet; sulphide contact, containing buoches and streaks of sulphide ore, 9 feet; blue lime, 21 feet; yellow talc and carbonate ore, 2 feet; hard and soft dolomite, 29 feet; soft and hard carbonate, 1½ feet; carbonate contact, 10½ feet; black flint, 13½ feet. This would give about 100 feet of porphyry overlying the blue limestone, a condition generally in the mineral bearing portion of the camp. The contacts show the ore to be thus far low grade, four or five ounces of silver and .06 of an ounce in gold.

LARIMER COUNTY.

The Bonbright group of mining claims north of Pearl, four claims, has been sold by its owner, John Drew, to a Pennsylvania company, consideration \$4000 cash and 200,000 shares of stock. The Bonbright group adjoins the State Line group.

MONTROSE COUNTY.

R. G. Hall, former manager American-Nettie mine and mill, M. Atkins and W. Kountz are at Cashin, where they have a bond and lease on the La Sal copper mines and smelter.

SAN JUAN COUNTY.

The Ledger M. & M. Co. has started its new \$100,000 stamp mill at the property at Chattanooga. The old mill was destroyed by fire last fall, since which time the company has been replacing it with an up-to-date and enlarged equipment consisting of a 200-ton mill, new shaft house and machinery. The company has developed a power from one of the adjacent streams sufficient to supply a mill double the capacity of the one which they are operating.

SUMMIT COUNTY.

H. H. Nicholson, in Breckenridge, expects to have the Hamilton rapid-drop 10-stamp mill running on good ore from the Hamilton group, Summit gulch section.

The Augusta Co. has temporarily suspended mining on the Juventa property at Lincoln. The Journal says the company, through T. R. Griffith, has expended between \$60,000 and \$70,000 in prospecting in that camp.

TELLER COUNTY.

The Pharmacist Co. will install cages in its main workings to facilitate handling increased tonnage of ore by lessees.

Cripple Creek district October output was 56,100 tons, which yielded \$2,008,800. The table for October is as follows:

	Tons.	Av.	Total.
U. S. & R. R.	15,000	\$29	\$ 435,000
Telluride	2,000	30	60,000
Union	10,400	32	332,800
Dorcas	2,800	30	84,000
Arequa	1,000	10	10,000
Economic	5,400	30	162,000
Portland	7,000	25	175,000
Smelters	12,500	60	750,000
Totals	56,100	\$31	\$2,008,800

The following table shows the dividend-paying mines of Cripple Creek district with the last dividends and the totals to date:

Acacia—Last dividend, 1 cent, \$15,000, paid December 15, 1900. Total to date, \$45,000.

Butterfly-Terrible—Dividend of ½ cent, \$6250, paid October 23, 1901. Total paid to date, \$31,250.

United Gold Mines—One cent monthly. Dividend of 1 cent, \$40,090.69, paid October 5, 1902. Total paid to date, including Consolidated Mines and New Zealand, \$955,933.45.

Doctor-Jack Pot—One cent monthly. Dividend of 1 cent, \$29,000, paid August 29, 1901. Total to date, \$232,000.

Elkton—Four cents quarterly. Dividend of 1 cent, \$29,000, paid August 29, 1901. Total to date, \$1,404,460.

El Paso—One cent quarterly. Last dividend 1 cent, \$24,250, paid December 20, 1901. Total to date, \$24,250.

Free Coinage—Dividend of 12 cents per share, amounting to \$120,000, paid in September.

Gold Coin—Decreased to 1 cent monthly. Last dividend 1 cent, \$10,000, paid October 15, 1902. Total paid to date, \$1,180,000.

Gold King—Three cents quarterly. Last dividend 3 cents, \$23,105.50, paid July 20, 1901. Total to date, \$272,421.50.

Golden Cycle—Paid 10 dividends to September 25, 1902, \$2,332,050. Pays monthly ½ cent, or \$11,250.

Ingham—Dividend of ½ cent, \$2425, paid August 28, 1901. Total to date, \$30,700.

Isabella—Pays quarterly, various rates. Last dividend 1 cent, \$22,500, paid March 23, 1900. Total to date, \$742,500.

Jack Pot—Pays at irregular intervals. Last dividend, 6 cents, \$75,000, paid December 23, 1899. Total to date, \$150,000.

Katinka—Paid first dividend of \$10,000 in October.

Last Dollar—Two cents quarterly. Last dividend 2 cents, \$30,000, paid October 21, 1901. Total to date, \$150,000.

Mary McKinney—Three cents quarterly. Last dividend 3 cents, \$30,000, paid October 10, 1901. Total to date, \$480,000.

Modoc—Two cents quarterly. Last dividend 2 cents, \$10,000, paid April 15, 1902. Total to date, \$310,000.

Nugget—Last dividend of 1 cent, \$9910, paid July 19, 1901. Total to date, \$30,600.

Pharmacist Cons.—The old Pharmacist Co. paid a total of \$84,000 dividends in the early days of the camp.

Pointer—Dividend of 1 cent, \$12,500, paid June 1, 1901. Total to date, \$25,000.

Portland—Six cents quarterly. Last dividend 3 cents, \$90,000, paid October 15, 1902. Total to date, \$4,297,080.

Stratton's Independence—Dividend of 20%, \$241,000, paid in October, 1901. Total to date, \$3,553,885.

Vindicator—Three cents quarterly. Last dividend 5 cents, \$55,000, paid July 25, 1902. Total to date, \$862,000.

Zoe—Dividend of ½ cent, \$7500, paid December 25, 1900.

In Cripple Creek district there are 5217 men employed in the mining industry. The monthly payroll amounts to \$528,899.71. Battle mountain employs 1685. Bull hill ranks second, 1531 men being employed. The total of 5217 men are employed at 255 different places, showing that to be the number of properties now being worked. The large number of men employed on Battle mountain are distributed among thirteen different properties, giving that section the highest average of men to a property also. The smaller number of men on Bull hill are divided among thirty-seven properties.

Victor hears that the War Eagle strike is unusual, that the lessees have already taken out \$40,000 worth of ore in going down 40 feet, and are shipping the entire vein which is 15 feet wide and averaging \$25 a ton. The property is being worked by the War Eagle M. & L. Co., who have a three years lease at 10%. A production of 500 tons a month is being maintained entirely from the development work done in sinking the shaft.

There has been much speculation as to the policy the administrators will pursue with reference to the mining interests which the late W. S. Stratton had in Cripple Creek. It is stated that the mining properties lying outside of the claims now being operated by the company will be worked by lessors. It will be the

policy to open a number of the properties to leasers, although the ground in the immediate vicinity of claims being worked by the company will probably not be leased, nor will leases be given on any of the dumps. Over 200 applications for leases have been received at the offices of the Stratton-Cripple Creek Development Co. No leases will be granted, however, until some other matters have been disposed of.

If the laboratory tests hold good on a commercial scale with the treatment of the ores of the Ironclad mine, by the cyanide process, the ore as hoisted can be broken, hoisted and treated at an average cost of \$2 per ton and an extraction of from 85% to 90% of the gold contents obtained. The ore is oxidized and so loose between walls that it requires no powder to get it out. For that reason, it is locally figured, the cost of breaking and hoisting will be but \$1 per ton. As no roasting is required, it is figured that the cost of treating the ore will be another \$1 per ton. On ore averaging \$4 per ton in values there will be saved \$1.20 in gold above mine and treatment charges. A new hoisting plant of machinery is to be purchased for the shaft.

IDAHO.

ADA COUNTY.

Boise reports discovery of gold in the Black Hornet district. On the hanging wall is a streak of talc; next lies 14 inches of rich gold ore, then about 4 feet of ordinary ore.

BLAINE COUNTY.

The Halley Times says: At the Minnie Moore mine a 3 foot vein of solid galena flanked by some feet of concentrating ore was tapped last Saturday, by crosscut from the shaft on the 1000-foot level. The old mill may be discarded and a new one of much greater capacity constructed.

Martin reports another free-gold strike in that camp by J. B. Hood, values from \$25 to \$200 per ton, 2 miles from the Mayflower mine. Ground is being rapidly staked off.

CUSTER COUNTY.

At Stanley Basin Manager Burroughs and Foreman Greene intend to have the dredger in operation this fall. It is being rebuilt on new principles. Only a short flume will be used. The gold saving will be done principally on a series of shaking tables. The tailings will be taken away by means of elevators. Forty men are employed at the Valley Creek mine. The mill will be crushing ore by Jan. 1.

IDAHO COUNTY.

At Buffalo Hump three mills are operating on gold ore, the Big Buffalo, Crackerjack and Jumbo. Other claims doing development work are the Baby Louise, Atlas, North Pole and Combination. There are about 300 men on the payrolls of the different mines.

The district is within the confines of the Bitter Root forest reserve, but timber is scarce. Cordwood is \$6.50 per cord. Lumber is difficult to obtain at the prevailing price of \$40 per thousand.

The tramway at the Wise Boy mine is completed and will start next week.

The Clackamas G. M. Co. has started work on the Rob Roy and Australia claims.

ROOTENAI COUNTY.

Near Tyson the Cœur d'Alene Dredging Co. has bonded and purchased outright large holdings of placer ground for \$14,000 and will construct a dredger. The ground has been prospected and pay dirt going from 1 to 14 cents to the pan found in all parts.

The Tyson Con. M. & M. Co. has been organized. F. W. Haverland, manager; C. Toppings, superintendent. This company owns some quartz claims in the camp. The War Eagle is the most promising claim. It adjoins the Richmond, on the east. The company will put in thirty stamps.

The Homebuilder M. Co., in the Wolf Lodge district of Cœur d'Alene, has men developing the eight quartz claims. It is the intention of the company to install machinery for operating the mine.

OWYHEE COUNTY.

Connection was made last week between the Florida mountain tunnel, from Dewey, and the shaft sunk from the workings in the Trade Dollar mines above. The tunnel is the result of three years continuous work; is 7020 feet long from its mouth to the point where the connection was made, and 1700 feet under the summit of the mountain. The Nuggets says: Eventually the ores from the mines will go out through this tunnel to the Florida mountain mill at Dewey, and the work of milling the ores will be more centralized at Dewey, where the main office of the company is located. A circulation of air coming in through the tunnel was at once established.

SHOSHONE COUNTY.

P. Burke is superintendent Park mine,

5 miles from Mullan. A tunnel has been run on the property 1000 feet long, which pierces a 20-foot lead. It runs 8% copper.

C. S. Cryser of the dredge companies of Delta has bonded the Wake-Up-Jim gold-producing property at the head of Trall gulch, 3 miles from Delta, for \$50,000; cash payment, \$2000; second payment, \$35,000, Feb. 15, 1903; third payment, \$13,000, April 1, 1903.

Work on the dam across the Cœur d'Alene river at the mouth of Pine creek, 7 miles below Wardner, to keep the tailings from the concentrators from flowing down the river and into the lake below, has begun. It is expected that it will retain all the tailings which might flow down the river for the next ten years. As the tailings contain values \$2 per ton it is thought that ore retained by the dam might be worked over when finer machinery is invented to treat such low-grade ores.

MONTANA.

BROADWATER COUNTY.

The Corbin concentrating people have leased the waste dumps of the H. & H. mine at Winston.

CASCADE COUNTY.

At Great Falls J. J. Hill will arrange for the transformation of an old silver smelter of the American Smelting & Refining Co. into an iron and steel mill.

FERCUS COUNTY.

J. H. McCormick, superintendent Gold Reef mines, Gilt Edge, says the treatment of the black ores of those mines is proving satisfactory, a large per cent of the values being recovered.

GALLATIN COUNTY.

The International M. Co., by S. J. V. Henderson and E. A. Bradley of Bozeman, will develop a group of mines near Spring hill.

JEFFERSON COUNTY.

The Helena Livingston Co. has bonded the Mullers mine, west of Corbin; purchase price, \$16,000. Men have been put to work.

LEWIS AND CLARKE COUNTY.

A new road has been built from Silver Camp, in the northern portion of the county, to Wolf creek, which shortens the wagon haul 16 miles. At Silver Camp the ores are mostly base, silver-lead, some of which carry gold. At Copper Camp are found high-grade copper ores. Above the town of Lincoln is an extensive mining district, having leads containing free-milling gold ores, some of which are rich.

MEAGHER COUNTY.

W. W. McDowell of Copperopolis, lessee and manager of the Marcus Daly copper mines, says that a crosscut is being run on the 400-foot level toward the ore body, which was worked above the 300-foot level. This mine has produced considerable high-grade ore, running 50% copper.

PARK COUNTY.

A. Livingston is receiver for the Bear Gulch M. Co., Jardine. Work on the new mill is going forward.

T. Shiels, at Cooke, has the Silver Queen, Como, Puck, Silver Zone No. 2 and Maria L on Henderson mountain. On the Como a body of ore has been exposed.

NEVADA.

LINCOLN COUNTY.

The Quartette M. Co., operating at Searchlight, reports a net haulion yield for the quarter ended September 30th of \$11,733, the tax on which is \$375.

The Bamberger-De Lamar Co. at De Lamar figure on having their mill in operation in January. Power is to be derived from Meadow Wash, 15 miles, water being piped to the plant. The new mill and power plants will cost about \$250,000. It is expected that a great saving in expense will be effected. It is estimated that 100,000 tons of ore are in sight, averaging \$10 per ton.

The Chiquita mine, Searchlight, recently bonded, has a streak of ore in a 4 foot lead 15 inches wide, running \$100 per ton.

NYE COUNTY.

(Special Correspondence).—Jno. Hays Hammond had twelve men working here under his personal supervision last week. Everything looks well. Herewith is supplied the exact facts as to the present development work being done in Tonopah: Tonopah Old Co., new shaft, three compartments, 40 H. P. hoist, depth of shaft 420 feet; Valley View, three-compartment shaft, 22 H. P. hoist, depth of shaft 300 feet; Wandering Boy, two-compartment shaft, 22 H. P. hoist, depth of shaft 490 feet; Stone Cabin, two-compartment shaft, 12 H. P. hoist, depth of shaft 225 feet; Gold Hill, two-compartment shaft, 40 H. P. steam hoist, depth of shaft 200 feet; Fraction No. 1, two-compartment shaft, 12 H. P. hoist, depth of shaft 240 feet; Fraction No. 2, two-compartment shaft, 30 H. P. hoist, depth of shaft 500 feet;

North Star, two-compartment shaft, 22 H. P. hoist, depth of shaft 380 feet; Montana Tonopah, two-compartment shaft, 34 H. P. hoist, depth of shaft 200 feet; Mizpah Extension, two-compartment shaft, 12 H. P. hoist, depth of shaft 500 feet; Ohio Tonopah, two-compartment shaft, 30 H. P. steam hoist, depth of shaft 270 feet; Tonopah Tunnel Co., two-compartment shaft, 44 H. P. hoist, depth of shaft 240 feet; Belmont, two-compartment shaft, whim hoist, depth of shaft 250 feet; Halifax, two-compartment shaft, whim hoist, depth of shaft 240 feet; Little Tonopah, two-compartment shaft, 12 H. P. hoist, depth of shaft 60 feet; Zenith, two-compartment shaft, whim hoist, depth of shaft 70 feet; West End, two-compartment shaft, whim hoist, depth of shaft 230 feet; McNamara (Tonopah Con.), two-compartment shaft, whim hoist, depth of shaft 200 feet; New York Tonopah, two-compartment shaft, 22 H. P. hoist, depth of shaft 200 feet; California Tonopah, two-compartment shaft, whim hoist, depth of shaft 120 feet; Tonopah City, two-compartment shaft, 22 H. P. hoist, depth of shaft 170 feet.

There are a number of other companies just starting work, among them being the North Tonopah G. M. Co., Boston Tonopah M. Co., Midway M. Co. and a number of others. The ore bodies in the various mines in the camp are claimed by the owners to be satisfactory in the lower workings. The movement of high-grade ore continues to the railroads, and the indications are that it would take the several hundred animals now engaged in hauling some months to complete the task. The town is rapidly building up and the incoming stage is loaded to the guards. The present population is about 4000.

In the outlying districts there is but little development work being done at the Wepah district. There are large quantities of fair-grade ore in sight. The Alpine district is turning out well. Lynch & Omera have recently bought a claim for \$10,000 cash and are shipping ore now running about 50% lead, 180 ounces silver and \$9 in gold. This new camp is situated on the west side of Lone mountain, about 25 miles from Tonopah toward Candelaria. There has been some recent discoveries made on the south side of Lone mountain, and 4 miles from Silver Peak salt marsh. These ledges seem well defined and run high in gold and silver. H. C. Cutting owns most of the good claims in the new section. At Silver Peak the crosscutting work on the Silver Peak mines has been discontinued by the Colorado people who have it under bond. It is not known at the present writing whether the Denver people will take this property or not.

Tonopah, Nov. 3.

STOREY COUNTY.

The face of the Sierra Nevada and Union Con. joint east crosscut from the station on the 1600 level of the Union shaft is still in hard porphyry. The crosscut is out a total distance of 68 feet. The winze in the north drift from surface tunnel No. 2 in the Utah Con. mine is down 26 feet. The bottom is in quartz and porphyry.

On the 425 level of the Gould & Curry mine east crosscut No. 2 from the north-westerly drift is in 37 feet. The face is in very hard quartz, giving low assays.

WASHOE COUNTY.

The Silver City M. & D. Co. has been incorporated; H. L. Slosson, H. J. Hechtman, M. Fleishacker, F. H. Beck, L. Greenbaum, P. H. Flanagan, H. Fleishacker, J. H. Kinkead, L. Schwabacher.

WHITE PINE COUNTY.

B. S. Frost has bought the Wide West mine, Cherry creek.

NEW MEXICO.

GRANT COUNTY.

J. P. Deming of Silver City will put in a copper leaching plant to treat the ores from his mines in Burro mountains, where he has about thirty claims.

The Comstock No. 1 mining property, four claims, Shakespeare district, near Lordsburg, owned by C. Yeager, has twelve men developing. A large body of ore has been exposed and gives \$28 in gold, 6 1/2 ounces silver, 21% lead.

J. C. Woodward, who is getting out considerable rich ore at his Casino mine at Bald Mountain, is shipping to the El Paso smelter.

SOCORRO COUNTY.

The Graphic mine at Kelley has again been leased by A. B. Fitch of Magdalena. A concentrator is being built to handle the zinc-lead sulphide ores.

VALENCIA COUNTY.

At Santa Fe, the Eastern Railway of New Mexico is incorporated for the Atchison, Topeka & Santa Fe cut-off from Mexico, near the New Mexico boundary, to Rio Puerco. It will go through Aho Pass, cross the Rio Grande at Belen. It will be 265 miles long and will be the connecting

link for a direct east and west line from Kansas City to Los Angeles. Two branch lines were incorporated at the same time—one from Rio Puerco to Aho Pass, 55 miles long, crossing the Rio Grande at La Joya, and a cut-off from Brazil Springs by way of Portales into Texas, to connect with Fort Worth and Galveston, giving a direct line from San Francisco and Los Angeles to Fort Worth and Galveston. This cut-off will be 65 miles long in New Mexico.

OREGON.

BAKER COUNTY.

Near Bourne, Superintendent J. W. Gray of the Esmeralda G. M. Co. has men working on the property at the head of Big Cracker creek. He expects to employ fifteen men in development work, with the intention of constructing a mill in the spring.

Sumpter says that Mohr & Roe, who located two claims near the Cracker-Oregon a few months ago, have sold their holdings to that company for \$35,000.

The Aurora G. M. & M. Co., operating the Perry and Rachel mines east of Baker City, have closed down to put in new machinery for deep mining. W. W. Watson is superintendent.

The Lucky Boy G. M. Co. has incorporated at Sumpter; A. P. Jones, E. E. McCammon, S. R. Stott, incorporators.

GRANT COUNTY.

The Potosi group, Orphan Boy group and Golden Gate group of mines in Grant county, in the Red Boy and Greenhorn districts, will be operated under one management, the United Exploration Co.; president, L. Auorbach, who is secretary and treasurer of the Trinity mine, California.

JOSEPHINE COUNTY.

At the Eureka mine on Soldier creek Manager de Varilla has the 10-stamp mill in operation.

Superintendent Thompson, at the Greenback mine, on Grave creek, is putting in a new 20-stamp mill. The old mill, Greenback mountain, will be reduced to five stamps during the winter and will be used as a custom mill only.

Grant's Pass figures that the output of placer and quartz gold from the mines of southern Oregon for 1902 will be 45% greater than it was last year. The total output last season of the mines of Josephine county was \$1,054,200. This year it is expected to be \$3,000,000.

Six-horse teams are hauling machinery for the new 20-stamp mill of the Greenback mine on Grave creek. The Greenback produces from \$23,000 to \$30,000 monthly.

LANE COUNTY.

F. E. Sharkey reports a strike at his Lucky Boy mine of free milling ore "as good as anything in the Blue River district."

PENNSYLVANIA.

SCHUYLKILL COUNTY.

The coal strike commission has ended its tour of observation of the coal fields. The members of the party will meet at Scranton on the 14th inst. to take the testimony of the miners. The commissioners made a complete investigation of two collieries and the region lying between Mount Carmel and Berlin. Six days were consumed in traveling in the anthracite coal regions and the arbitrators feel that they are now qualified to sit in judgment on the controversy between the mine employers and their employees. The commissioners were lowered into mines of varying conditions and went through several breakers. They met the general superintendents, the mine superintendents and the foremen of the various collieries, visited and also personally talked with the miners in the lower workings. They will be able to understand questions and ask questions, where they would not have been able to understand if they had not been underground.

SOUTH DAKOTA.

LAWRENCE COUNTY.

A strike is reported by the Golden Treasure M. Co. on upper Deadwood gulch, 2 miles west of Central City. The company has been sinking a shaft on a vertical of siliceous ore; at the depth of 50 feet the vein has widened to 7 feet and ore assays \$45 a ton. E. P. Farnham of Central City is superintendent.

PENNINGTON COUNTY.

The Holy Terror is running a tunnel from the 900-foot level to the old Keystone ledge, which the Holy Terror plans to open up. Prospecting on the 900-foot level with diamond drills is in progress.

UTAH.

BEAVER COUNTY.

In the Cactus mine, Copper gulch, above the 300 level, ore carrying 35% copper has been developed, between the 300 and 400 the rock carries 7%.

A. W. McCune wants thirty teamsters

for his copper mine in Peru. The company pays \$50 per month and board and the men must agree to remain for two years.

N. N. Olsen is manager of the Apollo C. M. & M. Co., recently organized at Frisco.

At Milford the Majestic Co.'s shaft is going down in ore, some of it carrying copper.

SALT LAKE COUNTY.

Ore and bullion settlements in Salt Lake City during October totaled \$2,167,135; for the ten months of the year, \$16,784,681.

The Tribune says the furnaces of the "independent" smelters operating in that vicinity during October produced 1,896,802 pounds of copper bullion, carrying a small percentage of silver and gold. By the management of the Highland Boy there was sent out to the refinery over 600 tons, 346 tons were dispatched to the refineries, the total having a valuation of over \$500,000. There is also reported an increase in the production of copper, gold and silver-bearing bullion at the smelter operated by the American S. & R. Co.

SUMMIT COUNTY.

At the Nalldriver, at Park City, Superintendent Rood has work begun on the new Nalldriver hoist, 30x115 feet, with hoiler rooms, coal hunkers, carpenter shop and blacksmith shop in addition. The gallow-frame is to be of modern pattern, 45 feet hoist, and a three-compartment shaft is to be driven. The machinery for the plant is to be taken from the old Daly. Manager Spiro of the Little Bell of Park City is following up the recent strike and extending the drift to begin sinking on the ore without interfering with the main work.

Superintendent B. H. Hunt of the Deer Trail is piling up galena for shipment.

In Mammoth ground, at the Planetary, the vein is 35 feet between walls; the ores show a valuation from \$4 13 to over \$100 per ton.

UTAH COUNTY.

Superintendent George Summerville of the Pacific G. M. & M. Co. has a tunnel which will tap the vein in 30 feet. Small pockets of carbonate ore have been run through, indicating the ore is near.

WASHINGTON.

Thirty-seven contiguous claims in the Index mining district have been brought under one management. They comprise 21,000 feet on the main ledge. The companies consolidated comprise the Ethel Copper M. Co., the John D Copper M. Co. and the Mother Lode group.

FERRY COUNTY.

Men are employed on the Morning Glory mine taking out ore. Manager E. L. Tate expects the mine to pay its way hereafter.

C. P. Robbins of the Lone Pine Co. says he will not resume operations for the present.

Four cars each of Black Tail and Quilp ore, respectively, are being loaded at Republic for shipment to the smelter.

KING COUNTY.

The report of Assayer Wing of the Seattle assay office for October shows the total amount of gold assayed at the office during the month to be \$2,807,700.48. Mr. Wing estimates that November will be much larger this year than it was last year, for the reason that there are five steamers yet to arrive there from Nome, and he has advised that a large amount of gold dust will arrive from the Klondike district during this month.

WYOMING.

CARBON COUNTY.

Grand Encampment reports that the Osceola Copper M. Co., at the end of a 60-foot crosscut run from the bottom of a 60-foot shaft, has cut a vein, ore identical with the Ferris-Haggarty. The ore where found on the Osceola is 500 feet from the old workings on the Ferris-Haggarty.

Work on the main properties of the Pearl district is going on with satisfactory results. The Coldwater, Zirkel, Grand Republic, Copper King, Big Horn, Hawk-eye, Big Creek, Sierra Madre, Tully, Lizzie, State Line and Kalamazoo are all working full crews. Three of these properties—the Coldwater, Zirkel and Big Creek—have ore that will stand shipping and leave a profit.

The Grant Copper M. Co. will develop their property at Pearl. Considerable prospect work has been done.

LARAMIE COUNTY.

Popp, Dickson, Peterson & Thorenson have bought the Manila group of claims at the head of Whalen canyon and 5 miles from Hartville for \$30,000. The group comprises seven claims, on which veins assaying \$50 a ton in copper and lead have been opened.

FOREIGN.

BRITISH COLUMBIA.

A. J. McMillan of the Snowshoe G. & C. M. Co., before leaving for London, arranged for a hoist of 150 H. P. capacity over the main 300-foot shaft recently sunk on the Snowshoe, which will be the main working shaft of the mine. The hoist will be operated by electric power furnished by the Cascade Water, Power & Light Co., the lines for which extend from Cascade to Phoenix.

At Rossland the Josie mine will discontinue shipments to the Northport smelter for the present.

Kaslo reports eighty tons of Payne mine zinc ore shipped to Iola, Kan., for treatment. Four more cars are to follow. A contract has been made with the Slocan Star mine for 1000 tons per week. Other idle properties carrying zinc values will begin operations.

The Beatrice mine, near Camhounne, owned by Boucher Bros., has been bonded to Anderson & Fullmer of Revelstoke for \$32,000.

Rossland, to Nov. 1, reports tonnage in excess of the aggregate for last year. The record for 1901 has been reached and passed, and the output for the balance of the present year will represent the gain in tonnage over last year.

The Le Roi continues its output at about the figures that have ruled for some weeks, and employs 350 men. The War Eagle and Center Star mines are steadily increasing their output, this week's shipments being 3420 tons. It is expected that a maximum of 3600 tons weekly will be reached by the two mines, and that this will be the standard for the winter. Operations have been resumed at the Homestake mine. Details of the week's shipping operations are: Le Roi 3584 tons, Le Roi No. 2 360 tons, Center Star 2070 tons, War Eagle 1350 tons, Velvet 90 tons; total for week, 7454 tons; for year to date, 280,826 tons.

In southeast Kootenay, on Wild Horse creek, four placer companies have been at work all summer, moving gravel. The production of gold will be larger than that of last year.

The Nickel Plate mine will build a 40-stamp mill at Hedley City.

MEXICO.

CAHUILLA.

The Jimulco M. Co. will build a narrow gauge railroad from its mines to the Central Railroad, 7 miles distant.

CHIHUAHUA.

Chihuahua says the Botello group of mines has been sold to the Guggenheims. It is also reported that another large sale has about been completed whereby this firm will come into control of the Hidalgo M. Co.'s properties near Parral.

COAHUILA.

R. Mehan, manager Viesca smelter of the Coahuila M. & S. Co. of Mexico, says the Hornos Railroad will reach the former place by November 10.

The Reforma mines at San Juan, operated by S. Guggenheim's Sons, have resumed shipments and are now shipping at the rate of 500 tons a month. This output Superintendent Brendell expects to increase to 1500 tons.

SONORA.

The Sinaloa-Sonora Manufacturing & Smelting Co., E. R. Tufts general manager, is installing machinery on its property near Alamos, Sonora. Development work is also being carried on. V. Carrothers has charge of the work at the mines.

Catalogues Received.

The Brown-Corliss Engine Co., Corliss, Wis., a general description of their heavy duty Corliss engines, admirably portrayed and described in illustrated detail, sectional drawings and minute data of construction. The company builds all sizes from 100 H. P. up, and all speeds up to 150 revolutions, both in the vertical and horizontal types.

Standard size, 9x6 inches, "Imperial Air Compressor," Rand Drill Co., 128 Broadway, New York, fully up to the high degree of excellence which characterizes this class of work. The details of description are finely worked out and the illustrations "talk." The two on pages 18 and 19 are about as good as any that has come under the writer's observation.

In black and silver, standard size, 6x9 inches, a 290-page catalogue, No. 7, from the C. O. Bartlett & Snow Co., Cleveland, Ohio, general mill furnishers and suppliers of labor-saving machinery, a well arranged compilation of illustrated description of between 500 and 600 different devices, many of which are special machines made by the C. O. Bartlett & Snow Co. The catalogue is a most interesting one in the line of applied power.

Personal.

J. F. FARGO of Los Angeles, Cal., is in Chicago.

A. M. STRODE is manager Stewart mine, Wallace, Idaho.

J. P. KENNEDY is manager Badger mine, Susanville, Oregon.

D. C. JACKLING has returned to Salt Lake City from Colorado.

CLYDE JACKSON has returned from San Francisco to Tonopah, Nev.

W. S. MANN is assistant superintendent Sheep Creek, Alaska, mines.

L. VON ROSENBERG has returned from Mexico and Lower California.

C. B. ROGERS is general manager Modoc mine, Las Cruces, N. M.

C. A. B. HALVERSON is manager Freeport & Cripple Creek G. M. Co.

JESSE JACKSON is manager and superintendent Oro Fino, Washoe, Nev.

F. L. BOSQUI of Jardine, Mont., will spend the winter in San Francisco.

G. A. HEWSTON has charge of the Duplex Co.'s mill at Searchlight, Nev.

E. L. BALLOU has returned from Pony, Montana, to Igo, Shasta county, Cal.

S. G. WESTON is superintendent Pacific Mining Co.'s property, Elko, Nevada.

J. G. ALLYN of Mariner & Hoskins, is in Oregon, examining gold property.

R. A. HASBROUCK is manager Gold Dust Co.'s properties, Leeshurg, Idaho.

W. T. MENDENHALL will return from New York to Loomis, Wash., next week.

G. R. WOODWARD, Moctezuma, Sonora, Mexico, is manager Sonora Development Co.

H. SIMMINGTON is superintendent the Grand View M. Co., Cherry Creek, Arizona.

M. C. HARRINGTON is superintendent Keystone Co.'s properties, Park City, Utah.

VOLNEY WILLIAMSON has returned to Spokane, Wash., from Zacatecas, Mexico.

A. E. JESSUP of New York City is appointed chief assayer Chinese Mint at Tientsin.

F. A. LEACH, superintendent San Francisco Mint, has returned from Washington, D. C.

H. A. ALLEN succeeds P. R. Roberts as superintendent Adventure mine, Houghton, Mich.

P. C. DUBOIS, manager Conqueror group, Empire, Colo., has returned there from Milwaukee, Wis.

A. G. WILSON has resigned as president and associate manager Mt. Whitney Power Co., Visalia, Cal.

J. M. CROSS of Chicago assumes management of the Cleopatra property, Silver mountain, Empire, Colo.

G. W. OTTERSON has put in at Windham hay, Alaska, a hydraulic plant for the Yellow Jacket M. Co.

A. HOLDEN, managing director U. S. Co., and W. H. Cooldge of Salt Lake City, Utah, are in Boston.

C. H. HENNSMEYER is the Pueblo manager of the recently organized Western Union G. M. Co., Pueblo, Colo.

V. M. CLEMENT, manager Mexican Mining Syndicate, has gone from Salt Lake City to Zacatecas, Mexico.

H. V. WALLACE, general manager Veta Grande M. Co., Altar, Mexico, has returned there from Nogales, Ariz.

E. P. GRINDELL of Tucson, Arizona, visited the Chicago office of the MINING AND SCIENTIFIC PRESS last week.

SUPERINTENDENT TISDALE of the Alaska Snettisham G. M. Co., will operate the Snettisham mines this season.

J. LENOIR of Parral has been engaged as manager Santa Maria mine, at Gavilana, near San Jose del Sitio, Mexico.

J. F. SULLIVAN, manager Golden Valley M. Co., has returned from Denver to the mines at La Dura, Sonora, Mexico.

H. STEVENS, of the California State Mining Bureau, is in Redding, Cal., looking after the interests of the mining lands.

W. N. BISSETT, foreman Consolidated Cariboo hydraulic mine, B. C., has returned to Placer county, Cal., from the interior.

E. DICKINSON, late general manager Union Pacific Railway, is now general manager Kansas City, Mexico & Orient Railway.

W. WILSON, representing the American Con. Copper Co.'s interests in Grant county, New Mexico, has returned from Santa Fe to Lordsburg.

L. G. MARTIN is in San Francisco to superintend the laying of the land lines for the Pacific Cable Co. at San Francisco, and also the land cables at Hono-

lulu. This cable is expected to be in working order between Hawaii and United States by Jan. 1, 1903.

J. B. HASTINGS, former general manager War Eagle and Center Star companies, Rossland, B. C., now of New York, is visiting Spokane, Wash.

D. R. OLIVER, president Zubieta M. Co., has returned to San Francisco, and says he will rebuild the mill of the company, recently destroyed by fire.

F. JOHNSON, who has been in charge of the Stratton Cripple Creek M. & D. Co., Cripple Creek district, Colo., has resigned. His successor has not yet been named.

J. T. KESCEL, former foreman Anchor mill, Park City, Utah, goes to the Sheba G. & S. M. Co., to remodel their mill and take charge, in Star district, Humboldt county, Nev.

J. H. STRITE, who for the past eight months has been building a modern 60-stamp mill at Smuggler, Colo., for the Tomboy M. Co., has returned to his home at Redding, Cal.

L. WALKER has resigned the superintendency of the California mine, Sumpter, Oregon, and taken a similar position with the Cracker-Oregon Co. A. L. McEwen succeeds him at the California.

J. W. YOUNG has resigned the position of secretary to accept that of general foreign manager of the Allis-Chalmers Co., with headquarters in London. Mr. Young will leave for England in about a month.

B. BLAKE has resigned as superintendent Pacific Refinery, Bakersfield, Cal., and goes to Tampico, Mexico, where he will take charge of the erection and operation of a refinery. R. S. Knight succeeds him in charge of the Pacific Refinery.

DR. W. S. WARD, field commissioner of the mining department of the St. Louis Exposition, says: "The mineral display at the St. Louis Exposition will, in my opinion, be the finest ever gathered together in the world." Dr. Ward was assistant director at the Paris Exposition.

Commercial Paragraphs.

T. C. E. HUNTER of the Compressed Air Machinery Co. of San Francisco has returned from Siskiyou county, Cal., where he secured a contract for a 120 H. P. compressor plant for A. C. Brokaw, Quartz valley.

ON his return to Los Angeles, Cal., from examining the property of the Old Dominion C. M. & S. Co. at Globe, Arizona, F. H. Probert brought with him forty tons of their second-class ore, to make a series of concentrating tests at the Llewellyn Iron Works, Los Angeles, to see whether it will be possible to economically treat this class of ore.

J. H. SANBORN, Pacific coast agent for the Leyner drill, reports that at Nevada City, Cal., the Posey M. Co. have bought a Leyner air compressor and water Leyner rock drills. The Oregon-Cracker M. Co. have bought a Leyner duplex air compressor, and at Salt Lake J. J. Trenam, manager Stockton G. M. Co., and F. M. Benedict have bought a Leyner compressor.

THE Colorado Iron Works Co. of Denver, Colo., report recent orders as follows: Keystone Copper Smelting Co., Santa Ana, Mexico, reverberatory furnace, crushers, rolls, Bartlett concentrating tables, impact screens, boilers, engine; Hall & McConnell, Pluma, South Dakota, 100-ton pneumatic cyanide plant; Jezuitlan Copper Co., Jezuitlan, Mex., one 47x120 copper furnace and forehearth.

E. H. STROUD & Co., Chicago, say that a Class 2 Cyclone pulverizer recently sold to a large lead manufacturer has made a surpassing record upon litharge, its capacity upon a 100-mesh product being over 4000 pounds per hour, taking only thirty actual horse power, and that it requires practically no attention, no clogging of the mill, the product free from flakes and so uniform that all passes the 200-mesh sieve.

FROM November 1 the firm of N. C. Bonnevie, consulting engineers, will be known as Bonnevie & Lee, consulting engineers, No. 17 Jacobson building, Denver, Colo. The firm will, as before, make a specialty of designs and superintendence of mining, milling, smelting and power plants, and has in Mr. E. A. Lee, for the last five years chief designer for the American Bridge Co., Denver office, received a valuable addition.

THE Green Horn Mountain Copper M. Co. of Salida, Colo., are installing a concentrating plant in connection with their mine at that place, and last week purchased from the J. H. Montgomery Machinery Co. of Denver, Colo., two sets of 14x27-inch high-grade crushing rolls and other necessary machinery to equip their plant. They expect to be running before winter sets in. The Montgomery Machin-

TABLE OF CONTENTS.

ILLUSTRATIONS.—Bullion Swat Furnace—Bullion Loading for Shipment; Boiler Room of El Paso, Texas, Smelter, 276. General View of the El Paso, Texas, Smelter; Appearance of Furnaces of El Paso Smelter After the Fire of July, 1901; Electric Power Car at Smelter, El Paso, Texas, 230. De Lamar, Nevada; View of Old De Lamar Mill, De Lamar, Nev.; Section of Engine Room De Lamar Mill, De Lamar, Nev., 232. The New Works of the Lunkenheimer Co.; Cylinder in Horizontal Position for Inserting or Removing Tracings or Paper, 233. Mining and Metallurgical Patents, 234.

EDITORIAL.—Isolation of Mining Camps; The Low Price of Silver; Something Unique in Mining Litigation; Advance in Mining and Metallurgy; Interesting Mining Topics, 277.

MINING SUMMARY.—285-286-287-288.

LATEST MARKET REPORTS.—17.

MISCELLANEOUS.—Concentrates, 278. Gold and Silver Statistics; Barium Dioxide in Cyaniding; Electric Development White River, Wash.; Profits of Gold Dredging in New Zealand, 279. New Smelting Plant at El Paso, Texas, 280. Ores Which Are Deposited by Underground Waters; A New Colliery Explosive, 281. De Lamar, Nevada, Mines; Treatment of Sulphides, 282. Lunkenheimer New Works; Pyritic Smelting of Gold; Blue Printing by Electricity; Notes on the Estimation of Copper by Potassium Permanganate, 283. Mining and Metallurgical Patents, 284. Personal; Commercial Paragraphs; Catalogues Received; Book Notices; Obituary; New Patents; Notices of Recent Patents, 288.

THE isolation of some mining camps is illustrated by the fact that the miners at Dale, San Bernardino county, Cal., were unable to take part in the general election on the 4th inst., because no ballots or election supplies had been received. In loading the stage at the railway station for its 80-mile trip the precious package was omitted, and about twenty California miners missed their chance to vote.

THE extraordinarily low price of silver—for the first time below 50 cents an ounce—affects mining, as it tends to check the production of gold, copper, lead, and even zinc. The economies of silver production have not, however, reached the limit, and it is possible that cheaper methods of silver production and reduction may meet the present low price. The world-wide conditions do not at present lend encouragement to belief in immediate higher prices.

SOMETHING UNIQUE in mining litigation is reported from Utah, where in a mine case decision both the plaintiff and defendant appeal to the Supreme Court. Ordinarily it is only the party adversely affected that seeks reversal from the higher court. Suit was brought by the Santaquin M. Co. against the High Roller M. Co. to determine ownership of a disputed area between their respective claims. The judge found that the Silver King lode was the prior location and decided that the area in conflict belonged to the Silver King lode and not to the High Roller people. But it transpired that the Silver King had been located by men who had transferred it to the Santaquin Co. before its incorporation. Accordingly the judge decided that that company had no legal title thereto, and, hence, had no right to bring suit. Then he dismissed the case and assessed the costs equally between the litigants. And now both litigants appeal therefrom.

EVERY advance in mining and metallurgy is the concentrated product of intelligent thinkers and workers who have thought out and wrought out that which is used by all with general profit. Such ability to use the fruits of others' labor constitutes a debt that can best be repaid by contributing to the common stock of knowledge. No department of industry offers more notable improvements than do mining machinery and appliances. In the last ten years the discovery of the cyanide gold solvent has in that one branch created a new line of special machinery. The same is observable in concentration, in machine drills, in the application of electricity, in pumping. Indeed, within the last twenty years the only recognizable thing about a gold mine in common with the old regime is the stamp mill, and that is fast being changed and modified till it bears only a resemblance to its prototype. It will be, however, many years yet till the stamp mill goes into a museum.

Interesting Mining Topics.

Next Monday, the 17th, at Golden Gate Hall, San Francisco, will meet the eleventh annual convention of the California State Miners' Association. Among other things at that meeting will be for the first time an effort to have read some practical articles on every day mining matters by practical miners, with accompanying discussion, a sort of exchange of information, the discussion being in some cases at least as interesting as the article that elicits such oral comment. This is considerable of a departure from the original idea of the Association's meetings, and is largely experimental. The idea is to get more direct and immediate benefit from these annual meetings in the way of practical interchange of knowledge and experience. There is an infinite variety of subjects on which miners and metallurgists could furnish interesting articles, which, with the accompanying discussion, would be of value. Here is a partial list—100 subjects, any or all of which would be interesting to miners at future meetings:

How to best save the fine gold when milling cemented gravel in drift mines; an example of successful co-operative mining; profitable working of a custom stamp mill; the building and operation of a wing dam; best arrangement for drop of stamps and why; experience with hydraulic elevators; improvement in arrangement of pipe lines and delivery of water through monitors; daily work of a cyanide plant; leaching carbonate copper ore with sulphuric acid; results of this season's river mining; cost of mining and milling gold ore; practical method of mine examination; economical work in running a tunnel in hard ground; treatment of low-grade copper ore; relative value of electric and compressed air power, by one who has tried both; how a fire in a shaft was successfully handled; sampling lead ores; retorting amalgam; main requisites in a mining report; improvements in gold milling; use of liquid chlorine in chlorination process; proper contour of silver-lead furnaces; example of profitable treatment of mine tailings; how a leaser made his lease profitable; new points in mine timbering; successfully resisting a claim jumper; best location and arrangement for a gold mill; experiences of a prospector; overcoming of machinery transportation difficulties; system of fire protection in a mining camp; building a pipe line; satisfactory instance of profit sharing; wear and tear of shoes and dies; best disposition of smelter slag; record of unwatering a mine; building and maintaining reservoir dams; successful record of a debris storage dam; timbering in drift mines; utilization of waste water; admission of visitors into a mine; relative value of zinc dust and zinc shavings in cyanide process; amalgamation tests; relief in case of mine accident resulting in personal injury; best arrangement of 10 stamp mill; successful securing of gold from black sands; to obviate loss in scorification assays; use of chuck-block in mortar; working with an arrastra; assaying concentrated sulphurets; slow vs. rapid-drop stamps; prospector's drill; cam improvements; belting on concentrators; incline vs. vertical shafts; river dredging; mining low-grade cinnabar ore; ditch and flume building; wooden vs. iron battery frames; lead dust accumulator; flash light photography; practical working of miners' unions; battery sizing boxes; sharpening drills; effective form of rolls; making valuable an abandoned mine; what a dry washer can do; proper duties of a mine foreman; removal of amalgam from copper plates; economic matting of sulphide ores; ore sampling in mill; organizing a joint stock mining company; one day in a mine manager's active duties; development of a prospect into a paying mine; successful drainage of a deep shaft; ventilating a drift mine; best weight for stamps; suitable arrangement of mill building on site; putting off large quantity of blasting powder; vertical vs. horizontal engine for stationary work; how assessment work is done; experience with iron rifles as a gold saver; timbering an incline shaft; changes in stamp practice; developing a prospect; selling a mine; operation of an amalgamator; details of cost of 6x8 tunnel; some ultimately successful mistakes; transmission of power; oil as fuel; ore sorting; mine inspection; application of belts and pulleys; utilization of water power; cleaning up after a cave; good method of bank blasting; improvements in sluice building; ore amalgama-

tion in the mortar; best way of ore crushing for cyanide process; errors in mill construction.

This list has been published herein before, as suggestive titles for articles requested from wide-awake men who do the things they talk about, for publication, as a sort of recompense for what they have learned from reading other communications from fellow miners. Of course, it is not even intimated that one-tenth of these suggested topics could be treated in one meeting. At many meetings of mining, electrical or civil engineers the appearance on the platform of a member "with a paper to read" is a signal for two-thirds of those present to go out, and with the necessary detail of a convention which lasts but three days, it is not likely that more than four or five papers will be read or discussed. Usually the most interest centers in the resolutions and the election of officers, and the work of the convention is left to the committees. Still, there are possibly members of the Association who would like to get more direct practical benefit from their presence.

The subjects of the papers to be read at next week's convention are as follows:

"Flume Construction," by W. C. Ralston; "Concentration of Gold Ores," by M. B. Kerr; "Methods of Mine Timbering," by J. O'Brien; "The Protection of Forests," by A. D. Foote; "Recent Improvements in Smelting," by Herbert Lang; "The Application of Crude Oil in Smelting," by A. von der Ropp; "Electric Power in Mining," by J. B. Tregloan; "Application of Machine Drills," by H. P. Stowe; "Observations on the Development of Gold Mines," by H. Z. Osborne; "Gold Dredging Industry," by T. J. Barbour; "The Design of Water Wheels for Use in Mining," by G. J. Henry; "The Cyaniding of Concentrates," by S. B. Christy; "Petroleum Oil Fields of California," by C. T. Deane; "Petroleum Oil as a Fuel," by A. M. Hunt; "General Mining Statistics," by C. G. Yale.

People of any kind of business or work always like to hear or see how others in their line view the same problems that are common to all workers in that branch of industry. It is naturally interesting to a man who has tackled successfully or unsuccessfully some bothersome thing in his daily duty as a mine superintendent, or mill man, or smelter, or foreman, or practical worker, to know how just the same difficulty was handled by some fellow worker from some other county or State, and, in bearing how it was done, a third or fourth, who thought it all out or worked it out years ago, may get a pointer from the newer way of doing it or looking at it, or discussing it may throw additional light on the solution of a vexatious question.

It is the modern tendency to have such organizations, such discussions, such mutual aids to mutual advancement. An important part of the technical literature that comes to this office is the published reports of the various technical societies all over the country. There is always a meeting of one of them—the country is so big, and the workers and their societies are getting so numerous that there is a continuous succession of them. And the published reports of the articles read and the discussions that followed make up the most interesting data. Such data is of value because it is the newest, freshest, best production of the men who are doing these things, and whatever it is about, whether mining, metallurgy, chemistry, electricity or anything else, it is the present state of the art, fuller and fresher than anything in text-books.

Of course, it may be said: "Very fine, no doubt, but that is not what the California Miners' Association was started for." Doubtless, it was not, but it need not interfere with what the Association was started for, but might aid and supplement the original aim and intent of that organization.

With no desire to make innovation, but with the friendly zeal that is felt by one who has attended every meeting of the Association, the writer expresses the belief that in doing what every other similar organization in the country is doing, the Association might, without derogation of its other duties, do itself and the miners it represents a service in the way indicated.

When one looks back, the past always looks narrow; the horizon always widens when one looks ahead, and the future grows broader.

Concentrates.

THE melting point of manganese is 1245° C.

STEAM in a boiler at eighty pounds pressure has a temperature of 323° F.

IN the Almaden, Spain, quicksilver mines, operations are carried on at a depth of 338 meters.

WITH a shaft 618 feet deep, full of water, the pressure per square foot at the bottom of the shaft would be 38,625 pounds.

WITH 55,000 cubic feet of air passing through a circular shaft 10 feet in diameter, the velocity per second would be 11.67 feet.

THE article which appears in the publication mentioned, and marked "Copyrighted," was written for and originally appeared in this journal.

THROUGH an opening 6 feet high and 10 feet wide, air with a velocity of 450 feet per minute would pass at the volume of 27,000 cubic feet per minute.

IN the case of normally acid pulp in the cyanide vats about 4 pounds of lime per ton of sands would correct it, an ordinary solution being subsequently run on.

IT has been approximately calculated that about 5,000,000 persons find direct employment in the world's mines. These in turn give employment to about 25,000,000 others.

WITH 80 pounds boiler pressure, cutting off at quarter stroke, the mean effective pressure (not the average pressure) in a non-condensing engine running under normal conditions will be 40 pounds.

THE little iron bolt that appears to be copper, but has only a slight film of copper on its surface, is covered by dipping in a solution of sulphate of copper $3\frac{1}{2}$ ounces, sulphuric acid $3\frac{1}{2}$ ounces, water one to two gallons.

THE U. S. Geological Survey has charge of the geological investigations, reports, maps, etc., and is a part of the Interior Department. The U. S. Coast and Geodetic Survey maps the coast waters, and is a bureau of the Treasury Department.

IT is a misdemeanor under the Penal Code of Arizona for any director of any stock corporation therein to declare a dividend except from the surplus profits arising from the business of the corporation, and in cases and manner allowed by law.

DISUSE or non-use of a water right is not an actual abandonment, but long continuance of such non-use would indicate intention to abandon. Abandonment is a question of intention, and whatever clearly shows that intent is admissible evidence.

THE British gallon of water contains 277.274 cubic inches; the United States gallon of water, 231. There are 7.48 United States gallons in a cubic foot, 6.23 British. A British gallon of water weighs 10.01 pounds, a United States gallon 8.35 pounds.

STANDARDIZATION is a good thing, but not to be worshipped. The fact that a thing is standardized does not mean that the standard, whether it be a screw or a gauge or a boiler or a drill, is the best thing of its kind. A standard is merely a fixed thing.

AS THE tellurium so thoroughly impregnates and colors the gold that the ordinary application of acids will not disclose the gold color to view, it can only be separated from the base metal by smelting, a process seldom available by the prospector.

THE efficiency of methods of the transmission of power may be stated to be very close to the following, when full load is transmitted: Wire rope, 68%; water, high pressure, 53%; water, low pressure, 50%; compressed air, 50%; compressed air reheated, 65%; electricity, 73%.

THERE would be little objection to profit sharing on the part of the employees in the plan proposed from South Dakota, but the most potent objection to the scheme would be the difficulty of inducing them to share in the losses that inevitably occur in all businesses.

IN gold dredging on the Feather river in Butte county, Cal., the yield is from 10 cents to 75 cents per cubic yard of material handled. The cost averages about 5 cents per cubic yard, which includes all expenses. The whole thing has been described and illustrated herein in every detail.

THE United States mints pay \$18.60 per ounce for gold, standard, 9 fine. Where the bullion deposited for coinage is suitable there is no charge. The depositor gets \$1 for every 23.22 fine grains Troy gold in his deposit. The charge for simple recoinage of gold is \$1 for 1000 ounces.

IN handling timbers in a large mine winzes may be cut in or near the foot wall of a vein, reaching from level to level, timbers to be used in the stope lowered or run down through the winze and delivered on the floor where they are to be used, saving much time in underground hoisting.

TO KEEP machinery from rusting dissolve one ounce camphor in one pound melted lard; remove the scum; mix as much black lead with the lard and camphor as will give it an iron color; clean the machinery well; smear with the mixture; after twenty-four hours rub off; clean and polish with soft cloth.

AN air compressor at 3000 feet altitude, to furnish air for twenty-five $2\frac{1}{2}$ -inch rock drills in rock of ordinary hardness, the drills being 2000 feet from the compressor,

would require 272 H. P.; a duplex air compressor with 18-inch steam cylinders; 20-inch air cylinders; 24-inch stroke, making 175 strokes per minute.

THE Emplre mine, Grass Valley, Cal., has been a continuous gold yielder for fifty-two years. It is a good illustration of the permanence of gold mining as a business. In banking, merchandising, manufacturing, or any other department of industry, what business founded in California in 1850 is in active successful operation today!

FROST-PROOF MORTAR may be made by taking one barrel Portland cement, one barrel slaked lime, three barrels sharp sand; mix the whole dry, then add sufficient quantity of the carbonate of soda solution to make of proper consistency. The first setting should take place in one hour. After twelve hours good cement should have reached the final setting stage.

SO FAR as known, there is no record of mortality among American miners. In South Africa a record of deaths among 1377 rock drill men employed on the Rand showed an annual average of mortality of about 7%. The regular average mortality among healthy men aged 35 years in Europe is 0.8775%, which would make the mortality noted about eight times the normal death rate.

ZINC should not be used in contact with copper, iron or lead, as voltaic action is set up, especially when moisture is present, thus destroying the zinc. Salt, lime, water containing lime, and acid woods are also very destructive of it. When first exposed to the action of the atmosphere it is speedily corroded, but the film of carbonate of zinc thus formed protects it from further oxidation.

IT has already been proposed to utilize the waste heat from smelter slag to generate electric light and power. George Mitchell of Cananea, Sonora, Mexico, is credited with having offered at Butte, Mont., to furnish the copper plant with free power, and with the surplus to light the city and operate the street railway system; but thus far the feasibility of the idea has not been practically demonstrated.

TO CALCULATE the volume or amount of water flowing from a tank, multiply the square root of the depth of the water in feet by 5, and then by the area of the opening in square feet; the result will be the number of cubic feet per second. From a tank 8 feet deep, through an opening $1\frac{1}{2}$ inch diameter, the head being constant, would thus flow $2.8231 \times .01227 \times 5 = .173197185$ cubic feet per second, or 10.3913311 cubic feet per minute.

NO PART of the value of permanent and immovable improvements on a mining claim, made long prior to the location thereof by claimants under a previous location embracing the same ground, solely to improve and develop the prior claim, can be credited to the latter toward meeting the requirement of the statute "that \$500 worth of labor has been expended or improvement made upon the claim by himself (the claimant) or grantors."

IN the United States in 1900 there were 117 plants engaged in the smelting and refining of metals, 39 in the smelting and refining of lead, 47 in copper and 31 in zinc. The total capital invested in the smelters and refineries was \$139,354,138, employing 1121 officials and clerks, drawing salaries amounting to \$2,150,018, distributing \$15,937,626 to 24,504 wage earners, expending \$279,655,350 for raw materials and turning out manufactured products valued at \$358,786,472.

IN roasting sulphides there is an alteration of obnoxious compounds into indifferent ones; there is also the removal of sulphur, by which the ore grain becomes porous, the fine particles of gold and silver thus becoming accessible to solvents; there is, in addition, a fritting of the fine ore grains admitting of subsequent rapid leaching. If not roasted dead, however, instead of insoluble oxides are a mixture of sulphates and oxides, as well as undecomposed sulphides, and consequently, a less porous product.

PLATINUM was first discovered in Russia in 1819, although the actual exploitation commenced in 1824. From 1828 to 1845 platinum money was coined in Russia, these coins being 3, 6 and 12 roubles. The total amount put in circulation was 4,250,000 roubles, about \$3,272,500. During that period the production of platinum increased materially, but when the coinage was stopped the exploitation of the mineral almost entirely ceased and only revived in 1859. From that time the production increased with the foreign demand and market price.

THE Northern Pacific has about 20,000,000 acres of land left, the Canadian Pacific 22,000,000 and the Great Northern less than 1,000,000. The latter road will have disposed of all its lands within a very short time. The remaining scattered acres are in closely adjacent States. It is said that last year the average price received per acre was \$9. The Northern Pacific sold its lands last year in immense tracts to syndicates. Much of the land was timber land. The average price was \$1.50 per acre. The Canadian Pacific's sales of purely agricultural lands lying adjacent to the rails averaged \$3.25 per acre.

IN cold climates the employment of concrete has its objections, in that the material will freeze before it sets, and upon thawing is found to be practically worthless. In such cases the operation of setting may be hastened by dissolving two pounds of carbonate (not bicarbonate or cooking) soda in one gallon of water, boil the solution and use it in mixing the concrete with whatever addi-

tional water is required; the water and sand should also be heated. This heat will remain long enough to allow the concrete to set, which should be about forty-five minutes. Subsequent freezing, if the mass is not thereby cracked, will not injure the concrete.

IF copper sulphide be fused in presence of a suitable flux, for which a blast furnace slag, melting at about 1500° C., is found available, and calcium carbide added in theoretical proportions, the reduction occurs readily, the calcium sulphide dissolving in the slag, and the copper being recovered as an ingot free from sulphur. If copper pyrites be subjected to the same treatment, it is found that the ingot obtained is composed by two sharply separated layers, of which the lower is copper and the upper iron, saturated with carbon. For ores containing zinc or other metal volatile at the temperature used, a closed retort may be employed and the vapors condensed in the usual manner. The reduction of copper pyrites by this method requires an amount of 80% carbide, somewhat exceeding the weight of the ore; for copper sulphide the carbide and ore are used in the ratio 1 : 2.

IF the boiler pressure be taken at 200 pounds absolute, at which pressure 1 pound of steam occupies 2.27 cubic feet of space, the evaporation per second, or the volume of steam generated in the tube, will be .0163 cubic foot per second, occupying say 23 inches length of tube. Thus nearly half the length of the tube is filled with steam in each second of time, and the rate of flow equal to this head of water (H) is expressed in feet per second as $v = 8\sqrt{H}$, where H is in this case nearly 2 feet. v thus becomes 11 feet per second. But as the feed water has been found sufficient to fill only $\frac{1}{4}$ inch of tube, this flow is 782 times the feed, and, of course, could not continue, because the head due to space occupied by the steam would be reduced by the same proportion. Let the difference of head be reduced to 12 inches. Then $v = 8\sqrt{1} = 8$ feet per second velocity of flow due to a head of 12 inches.

IN the case of DeLamar vs. DeLamar Min. Co., Ltd., 117 Fed. Rep., (U. S.), 240, the court decided that the Waldstein patent, No. 607,719, for a process for extracting precious metals from cyanide solutions by the use of zinc dust as a precipitating agent, and the agitation of the solution until the precipitation is complete, "is void for lack of invention and anticipation, every step in the process having been disclosed in prior patents and publications. The additional features of claims 2 and 3, in requiring the use of a 'definite quantity' or the 'exact quantity' of zinc dust sufficient to precipitate the contained metals, does not render the process patentable, since the proper proportion is not given, nor the means for ascertaining it; and, conceding that such fact does not render the claims fatally defective, the patentee not being the inventor of the use of zinc dust by means of agitation as a precipitating reagent, the public is free to use such quantity as may be required to best produce the desired result."

A FLUID compound of carbonic acid, ammonia and water, with a few other saline ingredients, contains all the elements of protoplasm, and plants can subsist upon such a substance and form it into protoplasm within their cells, but from such a fluid animals can derive no sustenance. The animal can raise only the complex substance of dead protoplasm, as we find it in our food, to the higher power of living protoplasm, while the plant can raise the less complex substances—carbonic acid, water and ammonia—to the same stage of living protoplasm. It should be noticed that the existence of the "matter of life" depends on the pre-existence of the three compounds, carbonic acid, ammonia and water. Withdraw any one of these three from the world and all vital phenomena come to an end. They are related to the protoplasm of the animal. Carbon, hydrogen, nitrogen and oxygen are lifeless bodies. Of these carbon and oxygen unite and give rise to carbonic acid, hydrogen and oxygen give rise to ammonia, and these compounds are all lifeless, like the elements of which they are composed, but when under certain conditions they are brought together they give rise to the still more complex body which we call protoplasm, and which exhibits the phenomena of life.

ALL alloyed steels can be annealed by packing in airtight boxes or muffles and then placing them in the furnace and maintaining an even temperature of say about 1200° F. for twenty-four hours, then permitting it to cool down slowly. One exception to this rule would be high manganese steel. Charcoal or any of the carbonaceous substances will answer for the packing material. Sometimes each individual piece of steel is wrapped up in asbestos and is packed in the box with layers of charcoal between them. After being annealed they show a much finer and velvety texture. The very hardest steel, if not hard enough to cut the material, can be heated to a good orange color and quenched in the blast, and in the absence of this oil can be used for the quenching. On those steels which are medium hard, the blast, the oil, or hot tin or lead can be employed. The tin or lead is just brought to the melting point, and the tools are partly chilled in this and then taken out and placed in the oil or blast. The mildest steel cannot be quenched in the blast, and must be tempered in the oil and water. When tempered in the water they are heated carefully, the cutting points are dipped in the water, drawn to the straw color, and then placed in the oil, so as to prevent the temper from running. A good annealing will place the steel in such a condition that it can be tempered in water, which gives it great endurance.

Gold and Silver Statistics.

G. E. Roberts, director of the U. S. Mint, has completed his report upon the production of the precious metals for the calendar year 1901. The final figures for the world's output by countries are as follows:

Country—	Gold.	Silver, Commercial Value.
United States.....	\$78,666,700	\$33,128,400
Mexico.....	10,284,800	34,593,900
Canada.....	24,128,500	3,145,600
Africa.....	9,089,500	7,829,500
Australasia.....	76,880,200	94,200
Russia.....	22,850,900	1,198,000
Austria-Hungary.....	2,136,700	3,113,000
Germany.....	59,800	99,500
Norway.....	41,700	32,400
Sweden.....	35,300	450,800
Italy.....	8,600	1,911,200
Spain.....	1,300	2,300
Portugal.....	692,300	257,700
Greece.....	24,500	4,700
Turkey.....	1,300	271,300
Finland.....	276,300	133,000
France.....	30,000	27,000
Great Britain.....	119,600	6,152,600
Argentina.....	1,067,200	5,553,100
Bolivia.....	2,081,600	1,129,000
Chile.....	110,000	4,600
Colombia.....	2,775,400
Ecuador.....	321,200
Brazil.....	1,771,600
Venezuela.....	405,400
Guiana (British).....	2,000,000
Guiana (Dutch).....	1,329,200	3,360,500
Guiana (French).....	31,700	500
Peru.....	640,300	527,800
Uruguay.....	1,201,600	1,037,800
Central America.....	9,901,500
Japan.....	4,500,000
China.....	9,395,900
Corea.....	861,700
India (British).....	435,000	48,500
East Indies (British).....
East Indies (Dutch).....
Totals.....	\$263,465,000	\$105,598,200

The total number of fine ounces of gold produced was 12,740,746, and of silver 174,998,573, the coining value of the latter being \$226,260,700.

The imports and exports of the precious metals of the principal countries during the calendar year 1901 are exhibited in the following table, the information relating to foreign countries having been received principally through representatives of the United States in those countries:

Country—	Gold Imports.	Exports.
United States.....	\$54,761,880	\$57,783,393
Africa.....	1,595,959	9,713,588
Austria-Hungary.....	35,731,855	7,585,753
Canada.....	4,579,809	24,744,890
Costa Rica.....	385,077	550,510
Denmark.....	804,000
Egypt.....	14,677,469	11,971,274
France.....	82,778,158	27,985,000
Fed. Malay States.....	1,870,878	875,952
Germany.....	61,126,228	12,278,509
Great Britain.....	104,060,588	67,961,962
India.....	26,957,409	20,666,059
Italy.....	914,994	2,067,640
Japan.....	5,308,563	5,770,562
Corea.....	1,290	2,450,737
Mexico.....	9,593,594
Netherlands.....	4,207,059	691,606
Nicaragua.....	455,000
Norway.....	516,386
Siam.....	2,361,450	79,700
Sweden.....	731,461
Switzerland.....	13,407,332	4,009,891
Russia.....	4,459,685	34,870,237
Portugal.....	1,322,387	1,353,909

The net exports of Australasian gold are estimated at \$76,880,200 and of Chinese gold \$9,091,500.

Country—	Silver Imports.	Exports.
United States.....	\$31,146,782	\$55,668,358
Africa.....	1,744,947	55,984
Argentina.....	23,995	86,599
Austria-Hungary.....	993,975	1,263,382
Bolivia.....	13,691,268
Canada.....	242,215	2,136,359
Costa Rica.....	47,043
Denmark.....
Dutch Guiana.....	52,560	28,097
Ecuador.....
Egypt.....	576,037	50,972
France.....	18,885,433	27,119,335
Fed. Malay States.....	11,063,574	9,432,220
Germany.....	4,479,537	6,981,031
Great Britain.....	61,141,061	58,640,532
India.....	39,885,187	16,549,234
Italy.....	1,430,707	1,398,994
Japan.....	154,255	1,281,509
Corea.....	450,557	100,473
Mexico.....	2,279,875	50,609,606
Netherlands.....	3,278,008	889,557
Nicaragua.....	50,000	50,520
Norway.....	187,264
Peru.....	6,738	98,712
Siam.....	762,207	186,916
Sweden.....	83,062
Switzerland.....	8,429,956	2,278,442
Russia.....	4,818,548	1,905,930
China.....	4,334,047	148,310
Hongkong.....	7,623,616	3,747
Straits Settlement.....	13,787,004	167,633
East Africa.....	606,510	32,227
Arabia.....	617,226	266,805

Ceylon.....	2,011,280	1,154,470
Persia.....	392,217	236,105
Turkey.....	886,462
Australasia (net).....	6,089,858

Mr. Roberts says that the annual consumption of the precious metals is estimated in round numbers at \$80,000,000 gold and \$57,000,000 silver.

The silver market was depressed throughout the year. The highest quotation on the London market was 29½d on January 2, and the lowest 24½d in December. The purchases on account of the Government of India fell off heavily from the preceding year. The coinage of the Indian mints for the eleven months ending with February, 1902, was only 48,507,600 rupees, against 150,780,774 rupees in the same months of the previous year. The demand for China also declined owing to the retirement of most of the foreign troops called there during the Boxer troubles of 1900. While the troops were there the shipments of silver were exceptionally large, and after their retirement silver bars and Mexican dollars accumulated at the seaports in unusual amounts, rendering further imports for the time unnecessary. The European demand for silver for coinage purposes is light, as the Governments are pursuing the policy of supplying needs for subsidiary coins by the recoinage of full legal tender coins.

About 30% of the silver output of the United States is from silver ores, the remainder being produced in conjunction with lead and copper. After allowing for industrial consumption, the increase in the gold stocks of the principal countries for the calendar year 1901 are estimated to have been approximately as follows:

United States.....	\$63,800,000
Austria-Hungary.....	27,600,000
Belgium.....	1,900,000
Great Britain.....	17,000,000
India.....	5,880,000
France.....	40,400,000
Germany.....	41,700,000
Italy.....	3,500,000
Japan.....	1,700,000
Netherlands.....	5,600,000
Portugal.....	2,300,000
Roumania.....	1,800,000
Sweden.....	1,800,000
Switzerland.....	3,500,000

The only countries showing a loss during the year are Norway, \$1,600,000, and Russia, \$9,700,000.

Electric Development White River, Wash.

Written for the MINING AND SCIENTIFIC PRESS.

The general plan of the White river power development by the Snoqualmie Falls & White River Power Co. will be to divert the water of White river, Washington, and to convey the waters thus diverted through an excavated canal to Lake Tapps. The level of this lake will be raised until it occupies an area of about 5000 acres, and will serve as a storage reservoir and settling basin. The outlet of this lake will be a short canal and tunnel connecting with a penstock on the brow of the hill overlooking the Stuck valley. Steel pipes leading from the penstock will convey the water under a head of 450 feet to the waterwheels in the powerhouse at the foot of the hill; and from the waterwheels the water will escape through a short tailrace into Stuck river. The powerhouse will be connected in with the present Snoqualmie Falls transmission system by circuits about 5 miles in length.

The intake at the point of diversion will be constructed of concrete masonry. The level of the river will be raised at this point, in order to effect a full entrance of the water into the intake by the construction of a submerged dam across the river, which will be continued to the intake in the shape of an earthen embankment designed to be higher than the river at any stage. There will also be constructed at the intake and in connection therewith a set of gates for the purpose of discharging the water back into the river and in shutting the same off from the canal at any time it may be desired to do so for inspection or repair purposes.

The canal throughout its entire length will be a

thorough cut through earth and cement gravel. The canal will be 25 feet wide on the bottom, with side slopes of 1½ to 1 below the water line and 1 to 1 above the water line, and will flow 6 feet deep. The canal and intake are designed to discharge a volume of water equivalent to 60,000 theoretical horse power under 450 feet head.

The contour of Lake Tapps is such that the raising of its level would overflow the lake at eight different points; but this is to be prevented by the construction of earthen dams at these particular points. Aside from these dams, the only work to be done in connection with the reservoir is to clear about 1000 acres of land across the lake and to build a ditch to connect Church lake with this storage reservoir.

The penstock is designed to receive the full discharge of the canal and will be constructed of concrete masonry. The penstock will have five outlets, through which will be discharged the water to the different pipe lines.

The present development contemplates the installation of one pipe line at present, sufficient in size to deliver 10,000 H. P. More pipe lines will be added later, as additional waterwheels are installed. The pipe lines will be of rolled steel plates riveted together and supported by concrete piers and anchored firmly to the earth.

The power house is designed to accommodate a 50,000 H. P. installation of waterwheels, generators and accessories. As an adjunct, there will be a machine shop, equipped with lathe, drill press, shaper and blacksmith forge, with necessary accessories. There will be installed in the power house two 3000 kilowatt generators and two exciters of the Westinghouse type, directly connected to impact waterwheels of sufficient capacity to drive the generators under full load.

There also will be erected, either separately or in connection with the power house, a transformer house and there will be installed therein 10,000 H. P. of raising transformers.

Profits of Gold Dredging in New Zealand.

C. E. Turner, describing gold dredging on the Matakita river, New Zealand, gives figures of costs and profits of interest. Mr. Turner says that the industry is profitable, if properly conducted, which is evident from the following figures. The nominal capital of a company need not exceed £12,000. This acquires the claim, buys new dredge complete and stores sufficient for six months:

COSTS OF WORKING.

Labor.	Per Week.
Dredge master.....	£ 6 0 0
Engineer.....	4 0 0
Two drivers at £3.....	6 0 0
Three winchmen at £3.....	9 0 0
One general hand.....	2 10 0

Total.....£27 10 0

Stores, etc.	Per Week.
Firewood or coal.....	£12 0 0
Lighting and lubricants, etc.....	1 0 0
Wear and tear.....	16 0 0

Total.....£29 0 0
Plus labor.....27 10 0

Total.....£56 10 0

Gold at £4 the oz. = 14 ozs. 2 dwts. 12 grs., say 14 ozs. to cover expenses.

Usually the engineer takes either the morning or 4 P. M. shift, so that the machine runs the whole twenty-four hours.

It will readily be seen that a dredge capable of handling 1200 cubic yards per twenty-four hours (which is a small amount) of wash that will average only 2 grains per yard will pay a good dividend. Thus 1200 yards at 2 grains = 2400 grains = 100 pennyweights = 5 ounces per day of twenty-four hours = in one week 30 ounces at £4 = £120, less working costs £56 10s, gives £63 10s profit, which = £3302 per annum. Deducting £302 for secretary and office expenses, there remains the handsome profit of £3000, or 25% on the nominal capital of the company.

Barium Di-oxide in Cyaniding.

Following is a summary of cyanide treatment at the City and Suburban mine, Johannesburg, S. A.,

designed to show the comparative results obtained with and without the use of barium di-oxide, as supplied by E. Schilz:

	Concentrates.	Coarse Sands.	Fine Sands.
Tons treated with BaO ₂	1,750	3,254	24,783
Tons treated without BaO ₂	563	1,898	23,863
Average value of sands per ton treated with BaO ₂ (dwts).....	18.332	17.267	6.486
Average value of sands per ton treated without BaO ₂ (dwts).....	19.767	14.975	5.136
Average value of residues per ton treated with BaO ₂ (dwts).....	1.640	1.719	0.867

New Smelting Plant at El Paso, Texas.

Written for the MINING AND SCIENTIFIC PRESS by C. W. ARTHUR.

Three miles from El Paso, Texas, is one of the largest and best equipped labor and time saving smelters in the world, upon the site of the old plant which was totally destroyed by fire in July, 1901. In the mesa portion of a town of about 2500 population on the banks of the Rio Grande river the smelter is located. This little smelter town, filled with a hive of workers, has its own public schools and buildings, its churches, electric lights in every house, stores, hospital and public building, and is a complete municipality in itself.

Approaching the smelter and town from the El Paso side the first things to attract the eye are the four tall smokestacks of brick, the compactness of the town including the plant itself, and the fortified appearance given it by the 3000 feet of brick flue walls on the south and west sides, and the steep rocky hills on the east side adds to the fort-like appearance of the town.

This plant although enormous in capacity is very compactly built, occupying not more than nine acres. Not a foot of space is wasted, although the matter of conveniences and room for work is plainly shown in every detail. The capacity of the plant at the present time is 40,000 tons of ore per month and is capable of indefinite expansion.

From the office immediately to the west a few yards, the first building is the blacksmith shop, built

General View of the El Paso, Texas, Smelter.

boilers is supplied from a storage tank of 75,000 gallons capacity sunk beneath the ground.

All the machinery in the entire works, including

iron floor which is absolutely fireproof. Connected with the boilers is a large octagonal stack, with a coping of brick of which it is composed, and runs up 160 feet.

Coming out of the power house on the north side is a steel pipe 5½ feet in diameter, resembling a big water main, connected with the blowers inside the power house by two small mains that come out on the north side of the plant and join together at a height of 14 feet, passing east to the end of the power house, thence south 350 feet into the parallel furnace building, connecting by distributing mains to the furnaces. This pipe is erected upon and supported by an iron structure of I-beam construction, and through it the air blast from the immense blowers in the power house is distributed to the nine furnaces. The furnace building is 240 feet in length. Material has been ordered for extending it 36 feet. It is a steel structure throughout, ventilators at the top entirely open on the north side from the ground about half way up. Here are the nine furnaces, seven lead and two copper, with space for two more. All the material, coke for fuel, charges of ore and fluxes, is carried to the top of the furnaces by electric trolley cars of eight tons capacity, each car operated by one man. The system here used is the third-rail system for the transmission of power. The cars are loaded from beneath the freight cars and from convenient system of bins, taken thence to the hydraulic elevator and again by electric power through a system of switches to any designated hopper and automatically dumped and returned. Alongside of this furnace building is a double-walled firebrick flue with connections from each furnace which leads to the two octagonal stacks, one of which is 225 feet high. The furnaces are fitted with convenience for handling the metal from the side and running it into the molds and the slag from the front into the large pots, thence wheeled away to where it is hauled off by the dummy locomotive.

On the south of the furnace building are the ore and coke bins, with elevated railroad tracks where the freight cars can be run and conveniently unloaded. The bins containing the different ores,

Appearance of Furnaces of El Paso Smelter After the Fire of July, 1901.

of steel, the machine shop built of brick on the north and the small building of steel for a copper and tin shop adjoining. The novel thing in the blacksmith shop is the long line of forges that are operated by a blast conducted by unseen pipes from the power house blowers.

To the west of these shops and foundry is the power house, in which is placed the machinery that furnishes the motive power for almost everything about the plant and town. This large building with a steel roof and iron floor contains four large Corliss engines of the cross-compound condensing type aggregating 2000 H. P. In this room are also two motors of 500 K. W. capacity, two of 75 H. P. each, and one 2000-light generator. From this house electric power is transmitted to every part of the plant, pump house, and for lighting the plant and town. The engine room has a fifteen-ton electric overhead crane capable of handling any piece of machinery in the room. All, or very near all, of the machinery is directly connected; all that is not is operated by small motors. The boiler room contains six 150 H. P. tubular boilers of high pressure, and space is provided for two more of the same type, or for one new type tubular that is being considered.

The pumping room contains the large hydraulic pumps for the elevator service used about the furnace room for moving the elevator that lifts the ore, coke, fluxes, etc. This room also contains the large fire pumps to be used in case of fire. These are in duplicate; in case of failure of one or more there are others to be called into service. Here, too, are the largest type water pumps for supplying and forcing water to the reservoirs in different parts of the plant and the town. These pumps are also in duplicate and there is no danger of a water famine at the smelter.

The sole fuel used in the plant for power development purposes is Beaumont oil. The oil for the

pumps at the river, is driven by electricity, no steam being used except in the engine room. All of the power plant given above except the pumping plant at the river is under one roof, with steel roof and

Electric Power Car at Smelter, El Paso, Texas.

cokes and fluxes are so arranged that the loading of the wheelbarrows and cars can be done by gravity and other conveniences for saving time and labor.

The next building on the south is the sampling building and works, another steel structure, fitted out with small roller mills operated by transmitted electric power. There is plenty of room for the proper and convenient sampling of ores and their preparation. In the northwest corner is the assay office.

South of the sampling department and ore bins comes the long low steel structure where the fourteen roasters are placed. These roasters are served by a large, square, red brick smokestack, making the fourth that carry away the noxious vapors high into the air. These roasters are considered sufficient for some time to come. Here is where many grades of the refractory ores are treated and the refractory elements driven off by the system of roasting when the ore is simplified, so to speak, and it can be treated by the ordinary processes of smelting and fluxing.

Along side of this building, which is about 400 feet long, is another double-walled flue extending the entire length of the building and leads to the square, red brick smokestack.

Down under the hill by the river is the pumping plant operated by electricity; this plant elevates the water necessary for the use of the plant and its inhabitants. The water is stored in elevated tanks about the plant and the five reservoirs.

The management of this plant deserve credit for their untiring energy and executive ability. F. C. Earl, the manager, has been ably assisted by the constructive and executive ability of T. S. Austin, the superintendent, and J. J. Ormsby, assistant.

Ores Which Are Deposited by Underground Waters.

J. M. MACLAREN.

These furnish the greater number of ore deposits of economic value. Their history will be, therefore, treated in detail as far as may be possible within the limits of this necessarily brief outline. We are indebted to Posepny for the first clear distinction between the regions of underground circulation, and between the work carried on in the respective zones. He divided the outer shell into a "lithosphere" and a "harysphere," the former being the region of "vadose" or shallow circulation, the lower boundary of which is the ground water level for the given region, and which is rarely, except in extremely arid regions, more than 100 feet from the surface. For the lower zone, the region of deep underground circulation, the term "harysphere" is unfortunate, since this zone, restricted as it must be in depth to less than 10 miles, is probably no greater in density, or, at any rate, inappreciably so, than the extreme outer shell of vadose circulation overlying it. Much preferable to denote this region is the term "thermosphere," suggested by Professor Le Conte. The depth of penetration of meteoric or surface waters in the zone of deep underground circulation is limited by the depths to which fissures extend, and this, again, is, for a given spot, dependent on the nature of the rock. Laboratory experiments have shown that under conditions of great heat and intense pressure apparently solid rocks can be made to flow, and whereas at and near the surface relief from stress in rock masses is obtained by fracturing and by settling along the fault lines so formed, there comes a point in depth where relief can be obtained by flexuring alone, the result of an actual flow of the rock particles, small indeed in relative measurement for each particle, but grand in the aggregate. It will, therefore, be clear that in this zone—the zone of flowage of Van Hise—there can be no fissure, and that the lower extremities of fissures extend no deeper than the upper portion of the zone of flowage, a depth certainly less than 10 miles.

The waters percolating in underground channels are undoubtedly—except, perhaps, in regions of recent volcanicity—almost entirely of meteoric or surface origin, and that they so circulate is due to the operation of the force of gravity, enabling the colder and therefore denser water from the surface by its superior weight to force the heated solutions from below to the surface. The latter move, as a rule, in the larger, more open channels, and hence move rapidly, with a temperature much higher than the immediately adjacent rocks, the smaller openings of which probably contain the descending waters. Posepny, appreciating the difficulties in the problem presented by the assignation of the same channel both to ascending and to descending waters, assumed that "the ground water descends in the deep regions through the capillaries of the rocks. At a certain depth it probably moves laterally towards open conduits, and, reaching these, it ascends through them to the surface." This assumption of the efficacy of capillary attraction was supported by a famous experiment performed by A. Dauhree, which apparently proved the power of capillarity in rocks to overcome pressure. But, as was shown by Osmond Fisher, the deductions based thereon, owing to a misapprehension of the conditions, were

erroneous, and there is now, indeed, much reason to doubt the efficacy of capillarity in the downward transportation of water, more particularly at depths where rocks are subjected to enormous pressure. But, having regard to the multiplicity and variety of underground fissures, there seems no reason to call in the aid of such a dubious agent on a large scale—at any rate as capillary force. The difference in density between connected columns of water at different temperatures is probably quite sufficient to account for all the observed phenomena in the circulation of deep underground waters.

As has already been seen, the region of underground circulation may be divided into two horizontal belts, and it will be of interest here to consider the work done in each, for it is along this line that the greatest advances in the science of ore deposits have been made. Considering, first, the condition of the waters in the lower belt, we find that they must be intensely heated. The average increment of temperature may be assumed to be 1° C. per 100 feet of depth. At a depth of 6 miles, below which extensive fissures are unlikely, the temperature of the waters must, therefore, be about 320° C., still below the "critical point," which is, for steam, 364° C. The pressure at this depth being far above that necessary to keep the water liquid, the work of underground solutions is that of superheated water, and how potent a solvent that may be the researches of Dauhree and more recently of Barus have shown us. Naturally the first work performed by waters in this region will be in their descent, for, gaining heat and pressure, and consequently an excess of solvent power with increase of depth, they will absorb a gradually increasing amount of mineral matter. For reasons which cannot be detailed here, the ascending waters are assumed to rise in the larger main channels, to reach which a lateral motion, occasionally horizontal, but generally with also something of a vertical component, must eventually be imparted to the circulating waters. During this movement a leaching doubtless also takes place. Here, then, we have a "lateral secretion," but far broader in scope and far more comprehensive than that of Sandberger, who restricted his lateral secretive action to the rocks immediately bounding the fissure in which the ore deposit is found. The waters, finding their way to the lowest point of their underground journey, emerge from the country rock into the main trunk fissures and commence their upward journey. They lose heat, and are subjected to diminished pressure, and, therefore, precipitate some of their contained mineral matter, a precipitation which is further facilitated by the heterogeneity of the solutions which are converging on the main fissure from all sides. Precipitation by emergent solutions from the walls of the fissure is a fruitful source of ore shoots or chimneys. This is, of course, better exemplified, as will be seen later, in the vadose region, or just immediately below it, than in the region of deep underground circulation. Finally, precipitation may also result from the influence of the fissure walls (e. g., the organic matter of the veins of Ballarat and of Gympie, Australia).

The characteristic compound deposited in the region of deep underground circulation is a sulphide of the metal, but tellurides and silicates may also occur. Sulphide deposition is always possible, although the waters are of meteoric origin, since long before they have commenced their upward journey they have been robbed of their oxygen by organic matter, and by the conversion of -ous into -ic salts—lower into higher oxygen compounds. The source of the metals in solution in deep fissures is, no doubt, primarily the small quantities contained in the volcanic rocks that have been extruded from the thermosphere into the lithosphere, though at the same time in any given fissure the metalliferous solution may be immediately derived in part or even wholly from sedimentary beds, the metalliferous content of which, of course, has been derived by an intermediate process of mechanical concentration from the degradation of igneous rocks. For long it was contended that the pyrites of igneous rocks was entirely secondary, but late research has shown that it must in many cases be regarded as a primary and essential mineral, and one which separated out on cooling. This observation is confirmed by the invariable association of sulphur and its compounds, gaseous and solid, with regions of active volcanic energy. The fumaroles and soffioni of Sicily and New Zealand are cases in point. That solution of the sulphides is facilitated by alkalinity of the percolating waters is a fair inference, since we know from laboratory reactions many of the sulphides of the heavier metals are soluble in solutions of the alkaline sulphides. The work done in the deep underground region may thus be axiomatically expressed: Meteoric waters slowly descend by force of gravity through minor openings, are transported more or less laterally to major fissures, in both cases gathering metalliferous content from the walls of the apertures through which they pass. They ascend through the main fissures and, losing their solvent power by reduction of heat and pressure, and by increased complexity of composition, deposit much of their mineral content as sulphides on the fissure walls.

The work of percolating waters in the region of vadose circulation is much more complex. The region extends from the ground water level to the surface,

and is, therefore, an extremely irregular belt, varying in thickness from zero to 100 feet, or even much more, according to the contour of the surface and the depth of the ground water level. This belt is characterized by the presence in solution of oxygen and carbon di-oxide. With these two gases a great variety of compounds is possible, the inquiry into the origin of which is further complicated by the action of organic matter on inorganic substances. We have, therefore, in this belt abundant chemical action, resulting in the formation and deposition of oxides, hydrates, carbonates, sulphates, etc.

Since we know that the surface of the earth is constantly changing with reference to sea level, it follows that the level of the ground water in a fissure is constantly falling or rising with relation to a given point in that fissure. While raising the ground water level would probably have but little effect on ore bodies, lowering it exposes to oxidation the sulphides of that portion raised above level. And as the waters of the vadose region have, generally speaking, a downward or a lateral movement, or one compounded of both, the metals in solution are carried down to or below the ground water level, and there the oxides, etc., are reduced to and redeposited as sulphides. The reduction is not necessarily the result of the decomposition brought about by organic matter, but more probably results from chemical interaction between the descending and the comparatively stagnant solutions below ground water level. There is thus a secondary enrichment of this zone, and if a region be conceived as undergoing continuous elevation, it follows that as its vein fissures rise there will be progressively increasing enrichment of the sulphides at its ground water level. This, indeed, is the gist of the modern view of the secondary enrichment of ore deposits, a process to which it would appear that most of the economically valuable ore deposits have been subjected. This theory has, moreover, a very important bearing on the permanence in value of ore deposits where pursued in depth. In many cases it furnishes an adequate explanation of the impoverishment in depth of fissure veins that have yielded well from the surface to depths of even 1000 feet or more, for it seems well established that the process of secondary enrichment may be carried far below ground water level. This enrichment, which is actual and positive, must be clearly distinguished from that process of secondary enrichment which takes place in the region of oxidation, where an ore deposit may be relatively enriched by the subtraction of its more soluble and worthless components by percolating chemically active waters. In this theory also lies an explanation of the restricted occurrences of "bonanzas," "pay streaks" or "patches." Since the movement of the solutions subsequent to their enrichment is dependent entirely on structural conditions, it follows that if the vein be laterally permeable above ground water level then, as will have been seen from the discussion of the movement of underground waters, the cooler descending waters will travel by these fissures and will at a lower point emerge on the fissure from which it departed at a higher level. If these emergent solutions issue from a vertically disposed fissure, the resulting enrichment will take the form of a steeply dipping "chimney" or "bonanza." In the absence of lateral fissures above ground water level the enrichment will take place along a horizontal zone coincident with the surface of the ground water.

It will, therefore, be apparent that a comprehensive sub-classification of the deposits resulting from the movements of underground waters must include all the phenomena indicated above. Again following Van Hise, the ensuing division of group B may be adopted:

(a) Ores which at the point of precipitation are deposited by ascending waters alone. These are generally sulphides, but may also be metallic, or tellurides, silicates or carbonates.

(b) Ores which at the point of precipitation are deposited by descending waters alone. They are oxides, carbonates, chlorides, etc.

(c) Ores enriched by a secondary concentration. Below the ground water level the ores in this division will be sulphides, tellurides, etc., and above they will be precisely similar in nature to those in group (b.)

A New Colliery Explosive.

A new device is reported to have been successfully tested in several collieries in Lancashire, England, to add to the simplification of coal mining. Under existing conditions, the coal, after it has been undercut, is brought down by an explosion of gunpowder. The new plan brings down the coal by water power exercised throughout a hydraulic cartridge and obviates wasteful shattering of the fuel. Made of steel, the cartridge is 20 inches in length. Along its sides are orifices, each of which admits a pressure of three tons per square inch, the total pressure being over sixty tons. When inserted into the hole bored into the coal to be operated upon, the cartridge is connected with a small hand pump. In a few minutes after the apparatus has been at work the coal breaks up and comes down in great blocks. There are no clouds of dust such as are caused by the gunpowder method, and the entire operation is carried on without danger to the workers. About 1½ pints of water

are used in the operation, and, as the liquid returns to the tank, it can be repeatedly used. Although the initial expenditure is greater, the cartridge method is more economical than the system now in vogue. It reduces the cost of labor, prevents waste and secures rounder coal. One colliery proprietor who has adopted the invention for use in three mines is reported to compute that each cartridge saves \$75 per week.

De Lamar, Nevada, Mines.

Written for the MINING AND SCIENTIFIC PRESS by J. W. NEILL.

The De Lamar mines are located in the Meadow Valley range about 30 miles by wagon road from Calientes. The rock formation is quartzite, uptilted and dipping to the north and east on an incline of 30°. The quartzite is cut by three porphyry dikes which strike approximately east and west, and by another porphyry dike which strikes approximately north and south with the strike of the quartzite heels and dips at an angle of 68° to the west. The ore bodies make at the intersections of the two major east and west porphyry dikes and the north and south porphyry dikes. This latter has been the seat of profound fissuring and this movement has fractured the quartzite of the surrounding country on both sides, producing two parallel fissures, which are similar in strike and dip to the black porphyry fissure itself. The east and west porphyry dikes are approx-

imately 300 feet apart at the nearest point, and at this point the black porphyry, which is the main north and south fracture, cuts through both porphyries. In relative age the east and west porphyries are probably the younger. The quartzite is most profoundly shattered in the neighborhood of the corners of these three porphyries, and in this locality the mineral solutions which have followed the fissuring and centered communities quartzite have been most active. The re-

less small pieces has been recemented by the mineral solutions into a compact mass of silica, thus forming bodies of extreme hardness. These ore bodies have had great area, in places over 100 feet square, and are developed from the surface to the 700-foot level, and are now being developed below this level. In addition to these shoots of ore in the quartzite there are several known shoots developed on the main black porphyry dike and partaking of the nature of regular fissure vein ore shoots differing only in that the quartzite adjoining the porphyry has been mineralized to a greater or lesser extent sometimes on the hanging and sometimes on the foot wall side of the dike, but without any well developed walls to the ore deposit itself. Further than this at least two of the parallel platings or fissures have developed ore bodies, and one of these promises to be of great magnitude and importance. This is the new "Hog Pen shoot" which lies to the south of and 700 or 800 feet away from the other and older ore bodies. It is from 12 to 18 feet in thickness and several hundred feet in length on the strike of the fissure, and is of peculiar interest and importance aside from its commercial value, which is great, as evidencing the fact that the ore bodies will make in the fissures in the quartzite away from the black porphyry itself.

The April Fool mine has been developed on another series of fractures which are parallel to the main black porphyry fissure, and they resemble to a marked degree the ores produced in the recently discovered Hog Pen shoot of the De Lamar. The ores of the quartzite ore bodies are peculiar in that they

on this property has followed this formation to a depth of 300 feet, and the promises of the future are bright. From the surface of all these properties very rich ores were taken out and much of it shipped by wagon to Milford and thence to the smelters at Salt Lake. These ores abounded in free gold, and to this fact the development of the camp is largely due. The treatment of the lower grades called for the piping of water and building of mills. The efficiency of the method employed, viz., cyaniding, is vouched for by the fact that fully 90% of the metal values were extracted. The camp has produced a gross valuation in the neighborhood of \$13,000,000, and of this fully one-half has been in dividends, which is certainly a very large proportion. The present consolidation of interests under one company and one management, with the enlargement of mill facilities and cheapening the handling through the introduction of electric power, will result in a renewed activity and renew a large production. The plans now perfected will result in an output from this supposed-to-be-worked-out camp in the neighborhood of \$125,000 to \$150,000 per month.

Treatment of Sulphides.

For some considerable time metallurgists at Broken Hill, Australia, have been experimenting on the metallurgy of lead and silver. Messrs. Carmichael and Bradford have a new desulphurizing process which affects the treatment of concentrates. The process has been tested on a large scale, and found

imately 300 feet apart at the nearest point, and at this point the black porphyry, which is the main north and south fracture, cuts through both porphyries. In relative age the east and west porphyries are probably the younger. The quartzite is most profoundly shattered in the neighborhood of the corners of these three porphyries, and in this locality the mineral solutions which have followed the fissuring and centered communities quartzite have been most active. The re-

show no evidence to justify their commercial character. It is a silicified and often glassy mass of quartzite which, under the microscope, shows that it is very largely a readjusted, or at least a recemented quartzite. The gold contents in these ore bodies is contained in exceedingly minute form, is practically never visible to the naked eye or in the pan, but has yielded readily to the treatment by cyanide. In the upper levels, particularly in the stopes of the black

porphyry fissure, considerable native tellurium has been found, and strange to say this mineral is almost barren in gold, which is contrary to local belief, but this mineral has been associated with some of the richest ore bodies in the mine and is an indicator of the origin of the gold from tellurides. In some places in these stopes tellurides of gold have been found and it is probable that the gold throughout the mine has been and is more or less in this form. In the new Hog Pen shoot the ore differs from the old parts of the mine in that it is more stained with iron and yields considerable gold to amalgamation, which the old mine did not do. The ores of the April Fool fissure system are stained with iron oxide, and, moreover, carry considerable silver values, thus differing from the De Lamar mine. In this mine in several places the undecomposed iron pyrites has been found in small patches where it has been protected by a clay gangue. Otherwise the ore is oxidized to the depth of 1100 feet, and at this depth the values are still of a commercial grade.

Differing from both the De Lamar and April Fool mines the ores of the Magnolia group occur in a porphyry dike at the contact with quartzite. These ores differ in character from the other two mines in that they are heavily stained with manganese and show a heavy percentage of free gold, and contain silver values which usually average in the neighborhood of an ounce in silver to a dollar in gold. Development
